COMMISSION.

VICTORIA, by the grace of God of the United Kingdom of Great Britain and Ireland, Queen, Defender of the Faith,

To Our right trusty and well-beloved Councillor, the Right Honourable Sidney Herbert ; and to Our trusty and well-beloved Augustus Stafford Stafford, Esquire ; Sir Henry Knight Storks, Knight Commander of the Most Honourable Order of the Bath, a Colonel in Our Army, and Secretary for Military Correspondence in Our War Department ; Andrew Smith, M.D., Director-General of Our Army Medical Department ; Thomas Alexander, Companion of the Most Honourable Order of the Bath ; Sir Thomas Phillips, Knight ; James Ranald Martin, Esquire, F.R.S. ; Sir James Clark, Baronet, M.D. ; and John Sutherland, M.D. ; greeting.

Whereas it hath been humbly represented to Us that, considering the great importance of maintaining and improving the health of all ranks of Our Army, at home and abroad, and of providing for their medical care and treatment in cases of disease, wounds, and other casualties whatsoever, in the most approved manner, it is expedient that certain inquiries should be made into the constitution of the Medical Department of Our Army, the mode of appointment of its officers, and the system which regulates their rank, pay, promotion, and retirement ; likewise it is further expedient to examine into the condition and administration of the Hospitals of Our Army, with a view to their increased efficiency.

Now know ye, that We, having taken into Our consideration the premises, do hereby order and direct you the said Sidney Herbert, Augustus Stafford Stafford, Sir Henry Knight Storks, Andrew Smith, Thomas Alexander, Sir Thomas Phillips, Sir James Clark, James Ranald Martin, and John Sutherland, to inquire into the organization, government, and direction of the Medical Department of Our Army.

And firstly, to inquire into the mode by which candidates for first Commissions are selected, and the system adopted for their promotion and routine of service ; also the mode adopted in regard to their pay and retiring allowances.

And further, We do order and direct you to inquire into the means now adopted for acquiring, keeping up, and adding to the professional knowledge of the officers of Our Medical Department, and to consider whether it will be expedient to encourage them to combine civil practice where compatible with military duty.

And further, We do order and direct you to inquire into the operation of the regulations now in force, with a view to the prevention of disease in Our Army, both at home and abroad, as regards barrack accommodation, encampments, clothing, rations, and other matters relating thereto, having regard to the various climates to which Our troops are exposed, and the duties and responsibility of the medical authorities on these matters.

And further, We do order and direct you to inquire into the state and condition of military hospitals, both general and regimental.

Also into the system adopted in the same, for the treatment of Our soldiers, and the powers possessed or exercised by the Medical Superintendents or other functionaries in such hospitals, for providing diet, medicines, and every requisite for the medical and surgical treatment of the patients under their charge, together with the character of the diet, medical comforts, furniture, and other hospital supplies.

Also, We do further direct you to inquire generally as to the expenditure of such hospitals, and the financial control now exercised in and over the same, and the relative authority of the various departments whose functions are exercised within the hospitals.

And further, We do order and direct you to inquire into the rules and regulations, or the practice, in force for invaliding and discharging the soldiers of Our Army, when brought forward for discharge, as unfit for future service.

And further, We do order and direct you to inquire into the system of management and treatment of and the provision made for, patients in civil hospitals, whether in immediate connection with Our Army or otherwise, and to consider whether such management or treatment, or any portion thereof, can be introduced with advantage in the Medical Department of Our Army.

And We further order and direct you to inquire into the expediency of making provision in Our military hospitals for the officers of Our Army suffering from disease or accident incurred in Our service, and to consider whether it will be advisable to provide in Our military hospitals for the treatment and cure of lunatic officers or soldiers, or to establish a separate military hospital or hospitals for that purpose, or in any other manner to provide for the treatment of such cases.

And We do further command and require you to report what changes you may consider it expedient to make in the organization, management, and expenditure of the Medical Department of Our Army, with a view to the utmost efficiency of this branch of Our military service, and what measures you may recommend to be adopted, with a view to the preservation of the health of Our troops at home and abroad; and also that you do report your opinion upon such returns or records as should be kept by the medical officers of Our Army, with a view to the preparation of a well digested and accurate body of military medical statistics.

And it is Our further will and pleasure that you, or any five or more of you, do obtain information touching the matters aforesaid by the examination of all persons most competent, by reason of their knowledge, habits, or experience to afford it, and also by calling for all documents, papers, or records which may appear to you, or any five or more of you, calculated to assist your researches and to promote the formation of a sound judgment on the subject, and that you, or any five or more of you, do report to Us, under your hands and seals, your several proceedings, by virtue of this Our Commission, together with your opinions touching the several matters hereby referred for your consideration.

Given at Our Court at St. James's, this fifth day of May, in the year of Our Lord one thousand eight hundred and fifty-seven, and in the twentieth year of Our reign.

By Her Majesty's Command.

(Signed) PANMURE.

REPORT.

WE, Your Majesty's Commissioners, appointed to inquire into the sanitary condition of the British army, the state of the army hospitals, and the rank, pay, emoluments, and efficiency of the Army Medical Department, and to report what measures we think advisable for the prevention of sickness and the treatment of disease in Your Majesty's forces, have diligently inquired into the various subjects to which our attention was directed; and we now humbly submit to Your Majesty's consideration the results of those inquiries, and the conclusions we have drawn from them, together with the practical recommendations which we think it our duty to propose.

With a view to ensure method in our investigations we have classed under several heads the various matters into which, by the terms of Your Majesty's Commission, we were directed to inquire.

The classification we have adopted is as follows:—

1. The operation of the regulations now in force, with a view to the prevention of disease in the army, both at home and abroad, having regard to the various climates to which the troops are exposed, and to the duties and responsibilities of the medical authorities on these matters, particularly with reference to,—

Barrack accommodation.

Encampments.

Rations.

Clothing, and equipments.

2. The state and condition of the military hospitals, both general and regimental, including the powers exercised by the medical superintendents and other functionaries in such hospitals for providing the diet, medicines, and every requisite for the treatment of the patients; the character of the diet and other hospital supplies; the expenditure of military hospitals, and the financial control now exercised in and over the same; the organization and equipment of field hospitals; the relative authority and distribution of the duties of the various officers within the hospitals; the expediency of making provision in military hospitals for the accommodation of officers of the army suffering from disease or accident incurred in the service, and for the treatment and cure of lunatic officers or soldiers.

3. The system of management, and the provision made for patients, in civil hospitals; and whether such management, or any portion thereof, can be introduced with advantage into military hospitals.

4. The returns or records which should be kept by army medical officers, with a view to the preparation of well digested and accurate military medical statistics.

5. The invaliding and discharging soldiers when brought forward as unfit for further service.

6. The position of the army medical department, as regards,—

Education of medical officers, including,—

The qualifications of candidates.

The nature of their examinations.

The means of acquiring, keeping up, and adding to their professional knowledge.

Promotion.

Routine of service.

Relative rank and allowances.

Pay and retirement.

7. The constitution and organization of the office of Director-General of the Army Medical Department.

Upon most of these heads there exists a large amount of information in the Report and Evidence of the Commission upon the state of the Army Hospitals in the East; the Commission of Inquiry into the Supplies for the British Army in the Crimea; the Report of the Sanitary Commissioners to the Army in the East; the Parliamentary

Committee on the Medical Department of the Army, of which Mr. Augustus Stafford, M.P., was chairman; and the Statistical Reports on the sickness, mortality, and invaliding among the troops, presented to Parliament in 1838-9-40-1 and 53.

To these documents we have frequently referred in the course of our inquiry; and much of the evidence contained in them we shall have to quote in support of our conclusions and of the recommendations which we are about to offer.

We have, however, on all the matters submitted to us, examined witnesses whose experience and capacity appeared likely to assist and direct our judgment, and whose standing would give to their opinions on the subjects on which they were expressed the greatest weight and authority.

We begin with the most important part of the whole subject into which we have been instructed to inquire, namely, the powers vested in the Army Medical Department for the prevention of disease among the troops, both at home and abroad, and the operation of the regulations now in force for that purpose.

But before entering upon any consideration of the measures heretofore taken, or those which should in future be taken, to secure the health of the troops, whether in peace or war, the sufficiency or insufficiency of the former should be tested by the results produced. If the troops be habitually in the enjoyment of as good health as the rest of your Majesty's subjects, a state of things so satisfactory would seem to preclude the necessity of any further inquiry into the subject.

Rates of Mortality in the Army.

No principle in vital statistics is better established than that the rates of mortality differ widely among different ranks, classes, and occupations, and that such difference is permanent, when arising from permanent causes.

It seemed to us, therefore, important to ascertain the rates of mortality incidental to the soldier's life, as compared with those of trades in which men of the same class and the same age are usually engaged, and the conditions of which bear the greatest resemblance to his own occupation.

We must, however, premise that the army rate of mortality cannot be correctly calculated from the deaths per 1,000 of the troops during the period they are serving, because every year a certain per-centage of the force is invalided and pensioned, on account of disease contracted in the service; and of men so pensioned, a large per-centage die during the first year. The health of the army, as given in the returns, is therefore more favourable in appearance than in reality, on account of the constant discharge from its ranks of men in an advanced stage of disease, as we shall presently show.

Appendix
No. lviii. (1.)

But if the rates of mortality of the soldier, even with this qualification, exceed those of the classes with which he is compared, then the causes of that excess should be investigated, and the means of removing them, or, if removal be impossible, of mitigating their intensity, be sought.

The soldier is recruited generally at 19 years of age. He is drawn from two classes, the agricultural labourer and the working class in towns. He is carefully inspected by a surgeon, who rejects every man having any bodily infirmity, or bearing signs of future disease. Although the soldier's is therefore a picked life, we propose, before contrasting the rates of the mortality to which he is subject with those of some special classes and occupations, to compare them with those of the male population generally at corresponding ages throughout England and Wales, as stated by the Registrar-General.

The following table shows the strength and the mortality of the officers and men of the army serving both at home and abroad, from 1839 to 1853, exclusive of the artillery, engineers, and colonial corps, as given in a return furnished by the Adjutant-General,

compared with that of the civil male population between the same ages; first, in country districts alone, and secondly, in town and country, in England and Wales, as given by the Registrar General; and the rates of mortality per 1,000 men in each case.

Years.	Cavalry, Guards, and Infantry, exclusive of Royal Artillery and Engineers, West India and Colonial Corps.			Annual Mortality to 1,000 of the Civil Male Population of the same Ages as the Soldier living in Healthy Districts, 1849-1853.	Annual Mortality to 1,000 Males of the same Ages as the Soldier in the General Population of England and Wales, 1849-1853.
	Non-commissioned Officers and Men.		Ratio per 1,000 Men.		
	Effectives, average Strength.	Total Deaths.			
1839	98,912	2,914	29·5	7·7	9·2
1840	107,539	3,300	30·7		
1841	111,134	4,167	37·5		
1842	115,186	5,052	43·9		
1843	118,543	5,270	44·5		
1844	119,334	3,867	32·4		
1845	118,071	4,587	38·8		
1846	120,644	5,125	42·5		
1847	127,245	4,232	33·3		
1848	127,921	3,213	25·1		
1849	123,673	4,052	32·8		
1850	119,111	3,119	26·2		
1851	116,830	2,729	23·4		
1852	118,623	3,120	26·3		
1853	119,271	3,392	28·4		
	1,762,037	58,139	33·0		

That is to say, that whereas the deaths on the general English male population at the army ages during the fifteen years from 1839 to 1853, calculated at the annual average of 9·2 per 1,000, would have been 16,211, the deaths in the British army at home and abroad were 58,139, being an excess of deaths among soldiers of no less than 41,928.

The results shown by this table are further explained by the Diagrams C. and D., in Appendix No. lxxii. by which the difference in the mortality of the population, both in England and Wales generally and in healthy districts, is illustrated.

It may, however, be fairly objected to this comparison that the civilians in England are living in their own country and in a temperate and healthy climate; whereas a large portion of the army is serving in every part of the globe, and is exposed to every vicissitude both of temperature and climate.

The following tables are free from that objection, and show the comparative mortality of the army at home, and of the male civil population of England and Wales, between the same ages as the soldier, irrespective of the occupations in which they are engaged, and of the healthiest and unhealthiest portions of it, as stated by the Registrar General.

Rates of Mortality per 1,000 per annum.

Effective men of all ages of the Army at home:

Total	-	-	-	-	-	17·5*
Household Cavalry	-	-	-	-	-	11·0
Dragoon Guards and Dragoons	-	-	-	-	-	13·3
Foot Guards	-	-	-	-	-	20·4
Infantry of the Line	-	-	-	-	-	18·7

Population of England and Wales, army ages:

Town and country population	-	-	-	-	-	9·2
Country alone	-	-	-	-	-	7·7

One of the unhealthiest towns, army ages:

Manchester	-	-	-	-	-	12·4
------------	---	---	---	---	---	------

* The cause of the difference between these numbers and those given in the Army Statistical Report is, that the above are corrected for the numbers in the service at different ages.

Rates of Mortality per 1,000 men of the Army at home, and of the English civil male population, at corresponding quinquennial periods, as stated by the Registrar General.

Ages, 20 to 25, Civilians	-	-	8·4
Soldiers	-	-	17·0
25 to 30, Civilians	-	-	9·2
Soldiers	-	-	18·3
30 to 35, Civilians	-	-	10·2
Soldiers	-	-	18·4
35 to 40, Civilians	-	-	11·6
Soldiers	-	-	19·3

From this it appears that if the army at home were as healthy as the population from which it is drawn, soldiers would die at one half the rate at which they die now.

The results of this table are illustrated by Diagram B., Appendix lxxii.

But, as we have already observed, the soldier's is a picked life. All men offering to enlist, who bear signs of physical weakness or of tendency to disease, are rejected, and even after acceptance can be discharged on the representation of the regimental surgeon at any period within three years from their admission; and all these rejected lives are thrown back on the civil population.

A paper marked No. lxvi. in the Appendix, shows the number of men rejected by the staff surgeons, and how large a proportion of those deemed unfit are rejected on account of disease or infirmity tending to shorten life. Were such persons admitted into the service, the chances of the civilian and the soldier would, at the outset of their career, be the same as regards the probable duration of life, but the rate of mortality of the soldier would be increased.

On the other hand, the apparent health of the army is maintained by the continued influx of fresh lives in the place of those which are weeded out by the process of invaliding, by which means a large number of men whose physical powers are exhausted are thrown back on the civil population, while their removal lowers the rates of mortality of the army, though their deaths are owing to the military service which first undermined their health.

Thus, if all corps were exposed to the same risks, and the invaliding in each were conducted on the same principle and with the same degree of stringency, the rate of mortality would be low in each arm of the service in proportion as the invaliding is high, and *vice versâ*; and the rate of mortality among the invalids themselves would be highest where the amount of invaliding was the lowest, and *vice versâ*. The following table, however, shows that, owing to different disturbing causes, the results produced are at variance with the rule above stated.

See App. lviii.

	Annual Ratio discharged by Invaliding per 1,000 serving.				
	Under 7 Years' Service.	7 to 14 Years' Service.	14 to 21 in Infantry, and 24 in Cavalry.	Total under 21 or 24 Years' Service.	Above 21 or 24 Years' Service.
Household Cavalry - - - -	6·2	13·6	35·1	15·2	531·3
Cavalry of the Line serving at } home - - - - - }	14·7	23·5	36·7	20·9	739·0
Foot Guards - - - - -	14·3	16·1	20·0	15·9	331·4
Infantry of the Line serving at } home - - - - - }	15·9	21·1	55·6	20·8	987·0

Clearly, if every man likely to die could be invalided, the army would appear to be almost immortal; and in the same proportion that death can be anticipated by discharge, the rate of actual mortality in the ranks will be diminished.

To the state, the loss of the men by invaliding is the same as the loss by death. In either case the expense of obtaining and training a substitute must be incurred, and in either case the death of the man, whether he be a soldier in the receipt of pay, or an invalid in the receipt of pension, is equally attributable to military service.

It is obvious, therefore, that the rates of mortality, taken alone, represent a part only of the loss annually caused in the ranks of the army by disease.

To institute a fair comparison of the effects produced on human health and life of an average character by military service, as compared with civil occupations, an estimated amount of mortality should be added to the army rates for those who from sickness or conscious inability do not offer themselves, or who offer themselves and are rejected on examination for enlistment; and the death of invalids and pensioners should be transferred to the army rates from the civil rates in which they are now included.

The civil population, however, even under this mode of comparison, would still include deformed persons, idiots, lunatics, and those dregs of the population whose habits are such as to preclude the possibility of their offering themselves for military service, and indeed unfit them for any occupation.

We have been enabled to institute some comparisons between the rates of mortality of the soldier and those of civilians of different classes and occupations, the materials of which, so far as civil life is concerned, have been placed before us by Mr. Neison.

It must be borne in mind that a great part of the soldier's duty is performed in the open air; that he receives, as compared with the agricultural classes, an ample supply of food, is well clothed, and is housed at a considerable expense.

In all these respects, looking at his material position alone, his condition at first sight appears to resemble that of the agricultural labourer, though the latter has disadvantages from which the soldier is secured. If the agricultural labourer, not being a member of a friendly society, falls sick, he forfeits his wages, which are his only means of subsistence. His medical treatment is not lavish, nor the attendance in all cases immediate. If he be a member of a friendly society he has better attendance, and his sick pay puts him beyond the reach of privation.

To the soldier the government stands in the place of the friendly society. If he be ill, however slight the malady, he at once goes to hospital and has all the treatment and all the nourishment which his case may require.

Materially speaking, therefore, the life of the soldier at home (and in the following comparisons we are speaking only of the troops in the United Kingdom) and that of the agricultural labourer who is a member of a friendly society would seem to be open to a fair comparison.

The tables contained in the able paper by Mr. Neison, marked lxxi. in the Appendix, See App. lxxi. show, however, that within corresponding ages the—

Mortality of the Household Cavalry is	$= 1\frac{4}{5}$	} times as great as the mortality of agricultural labourers being members of friendly societies ;*
„ Dragoons, &c.	$= 2\frac{1}{5}$	
„ Line	$= 2\frac{9}{10}$	
„ Guards	$= 3\frac{1}{3}$	

which is only 6·056 deaths per annum in 1,000 as against 11·1 per 1,000 in the Household Cavalry, 13·5 in the Dragoons, 17·9 in the Infantry of the Line, and 20·4 in the Foot Guards.

But it may be objected, that though the soldiers' are originally picked lives, and though the government secures to them the same advantages as those provided for

* In these comparisons with various civil occupations or societies, it must be remembered that the persons engaged in them frequently withdraw, thus reducing the rates of mortality of the occupation which they leave; but against this must be set the discharge and invaliding of soldiers; the withdrawal, however, in the former case being at the will of the employed, in the latter at the will of the military authorities.

their members by friendly societies, yet the moral element in the character of that labourer whose providence induces him to lay by from his wages against the future, gives him an advantage in a comparison with the army taken as a body, without reference to the habits of the individual soldier.

The man who is provident is probably likewise industrious and sober, and his standard of health higher than that of men who have not the same qualities in a like degree. As regards this condition of providence, which is a moral condition, acting on a man's physical state, those soldiers only who are depositors in the Regimental Savings' Bank should be compared with the agricultural members of friendly societies. Unfortunately, however, the statistics of the army do not afford the materials for instituting such a comparison, though we think it most desirable that in future they should be so arranged.

A comparison, however, between the soldier irrespective of regimental savings' banks, and the agricultural labourer irrespective of his being a member of a friendly society, gives these results:—

Mortality of Household Cavalry	$=1\frac{1}{3}$	} times as great as the mortality of the agricultural labourer as well those who are as those who are not members of a friendly society, which is 8·002 per 1,000.
„ Dragoons, &c.	$=1\frac{2}{3}$	
„ Infantry	$=2\frac{2}{10}$	
„ Foot Guards	$=2\frac{1}{2}$	

Again it may be said, that though a large part of a soldier's duties are out of doors, yet he himself is for the most part quartered, and the greater part of his time spent in a town; though this does not apply to troops quartered at Aldershot, Shorncliff, or the Curragh, nor at some stations which are almost as much in the country.

A comparison with out-door trades, carried on in towns, gives the following results:—

See Notes VII. & VIII. of Appendix to "Contributions to Vital Statistics."

Mortality of Household Cavalry	$=1\frac{3}{10}$	} times as great as the mortality of out-door trades in towns, which is 8·535 per 1,000.
„ Dragoons, &c.	$=1\frac{1}{2}$	
„ Infantry, &c.	$=2\frac{1}{10}$	
„ Foot Guards, &c.	$=2\frac{1}{3}$	

But it may be alleged that much of the soldier's day is spent within barracks; he has his arms, accoutrements, clothing, and barrack-room, to clean; he also spends much of his time in his barrack-room or in the canteen; this brings the soldier within the range of comparison with trades but partially carried on in the open air; this comparison gives the following results:—

See notes V., VI., VII., & VIII. of App. to "Cont. Vit. Stat."

Mortality of Household Cavalry	$=1\frac{3}{10}$	} times as great as the mortality of partially out-door trades in towns, which is 8·449 per 1,000.
„ Dragoons, &c.	$=1\frac{1}{2}$	
„ Infantry	$=2\frac{1}{10}$	
„ Foot Guards	$=2\frac{1}{3}$	

It has been attempted to account for this excess by the amount of night duty performed by the soldier on sentry. This, however, in the cavalry and artillery is hardly worth mentioning, in the line is not excessive, and in the Guards amounts at present but to one night in five.

A comparison, however, with printers who work at night, and who moreover work six nights out of seven, gives the following results:—

Mortality of Household Cavalry	$=1\frac{2}{10}$	} times as great as that of night printers, which is 9·090 per 1,000; *
„ Dragoons, &c.	$=1\frac{4}{10}$	
„ Infantry	$=2$	
„ Foot Guards	$=2\frac{2}{10}$	

If it be alleged that the printer, though he works at night and that constantly, works in-doors, whereas the sentry is exposed to the night-air, the duty of the police affords an almost complete parallel with that of the soldier, except that it is more severe, being more continuous in its hours and recurring more frequently. The sentry duty in the army is regulated in the following manner:—The guard remains on

* In the *Times* office, where much care has been bestowed on ventilation, the rate of mortality was 8 per 1,000 for the five years from 1850 to 1854, both inclusive.

duty 24 hours and is divided into three reliefs, each man being two hours on sentry and four hours off; during the four hours' interval he remains in the guard room, and sleeps, if so disposed, on the guard-room bed—an inclined wooden plane at one end of the room. This practice is so far objectionable, that the guard rooms are confined and hot, and the man lies down to sleep in his great coat, which is often wet, and he is frequently roused from his sleep in a state of profuse perspiration to go out into the cold air for his turn of sentry duty.

Q. 5913-16.

The police duty is divided into three relays, two for the day and one for the night. The first relay commences duty at 6 a.m., and is relieved at 10 a.m. by the second relay. The first relay recommences duty at 2 p.m., and is again relieved at 6 p.m. by the second relay, whose duty ends at 10 p.m. The night constable begins his duty at 10 o'clock, and continues on his beat without relief till 6 o'clock on the following morning, and that for every night in the week.

Q. 6985-9.

The police night duty is therefore far more severe than that of the army, yet the mortality of—

The Household Cavalry = $1\frac{1}{3}$
Dragoons - = $1\frac{4}{10}$
Infantry of the line = 2
Foot Guards - = $2\frac{2}{10}$

} times as great as that of the police, whose rate of mortality is only 8·922 per 1,000.

Even comparing trades who work underground, and by shifts through day and night, such as miners, the result is still unfavourable to the troops, being in—

The Household Cavalry = $1\frac{4}{100}$
Dragoons - = $1\frac{3}{10}$
Infantry of the line = $1\frac{7}{10}$
Foot Guards - = $1\frac{9}{10}$

} times as great as the miners, whose rate of mortality is 10·314 per 1,000.

The results of these comparisons will perhaps be better appreciated when the rates of mortality of all the different classes and occupations compared are placed in juxtaposition in the following table :—

DEATHS PER 1,000 PER ANNUM AT AGES BETWEEN 20 AND 40.											
Agricultural Labourers. — Members of Friendly Societies.	Labourers. — Rural Districts. — Whether Members of F.S. or not. —	Out-door Trades in towns requiring great or little Exercise. — Not F. S.	Trades in towns only partially out-door. — Not F. S.	Printers. — Not F. S.	Police. — Not F. S.	Miners. — Not F. S.	Household Cavalry.	Dragoon Guards and Dragoons.	Infantry of the Line.	Foot Guards.	Artillery.
6·055	8·002	8·538	8·449	9·090	8·922	10·314	11·1	13·5	17·8	20·4	—

The occupation which comes nearest to the army as regards its rate of mortality is that of clerks. The close application to business, the sedentary attitude, the want of exercise and of fresh air, render their employment one of the most unhealthy of all extensive occupations.

It seems almost incredible that it should be necessary to have recourse to the most unhealthy occupations in order to institute any comparison in which the rates of mortality shall approximate to those prevailing among your Majesty's troops, for at present the army stands almost at the head of unhealthy occupations in the United Kingdom.

It is true that though these comparisons between the army and various occupations in civil life have been confined to the troops quartered at home, yet, a large proportion of the latter having served abroad, sometimes in unhealthy climates, such as India and the West Indies, many have had the seeds of disease implanted in them during their tropical service. That many of these stations are extremely prejudicial to health is clearly shown

by the following table of the mortality during two periods, extending in most instances between the years 1817 and 1856, the particulars of which are given in No. lxii. of Appendix, and illustrated by diagrams submitted to us by Sir A. Tulloch.

STATIONS.	Antecedent to 1837.		Subsequent to 1837.	
	Period of Observation.	Annual ratio of mortality per thousand of strength.	Period of Observation.	Annual ratio of mortality per thousand of strength.

Bombay - - - - -	1817 to 1836	62 ⁸ / ₁₀	1838 to 1856	60 ² / ₁₀
Van Diemen's Land - - -	} Data not available.	- -	{ 1839 to 1856	11 ⁸ / ₁₀
New Zealand - - - - -			{ 1844 to 1856	12 ¹ / ₁₀

These are exclusive of killed in action, so far as they can be ascertained, except as regards the returns from the three Presidencies of India, in which the men killed in action or who died of their wounds are included, as the documents did not admit of their separation from the others prior to 1837. In the subsequent period, they amounted in Bengal to 6·65, Madras to 0·22, Bombay 1·26 per 1,000 of the strength.

But the Guards, it must be observed, who have the highest rates of mortality of all the troops serving in the United Kingdom, do no Indian nor colonial duty, and the majority of the cavalry serves almost as exclusively at home.

The following table shows the deaths per 1,000, on different stations in the navy and army, from 1830 to 1836 :—

	Navy.	Army.
On the home station - - - - -	8·8	13·7
Mediterranean, including, in navy, the peninsular command - - -	9·2	18·
Naval forces in the East India command and troops in Ceylon - - -	15·1	46·2

But a certain proportion of this superiority on the part of the navy is accounted for by the larger amount of invaliding in that service than in the army, as will be seen from the following table :—

	Navy.	Army.
Home station - - - - -	} No of men invalided per 1,000.	38·2
Mediterranean - - - - -		25·7
East India command and Ceylon - - - - -		33·6
		25·3 9·5 3·6

The following table, for a later period, shows the mortality from disease alone in the navy, in the seven years, 1837–43 :—

	Per 1,000 annually.
Home - - - - -	6·8
South America - - - - -	6·7
Various - - - - -	8·
Packet Service - - - - -	8·6
North Coast, Spain - - - - -	8·5 - 4 years' average only.
Mediterranean - - - - -	10·7
Cape - - - - -	11·
West Indies - - - - -	19·2
East Indies - - - - -	34·2
West Coast, Africa - - - - -	57·0

Unhealthy stations.

Annual average per 1,000 14·9 Mean force 33,000.

From this it appears that, though on the most unhealthy station the mortality reaches 57 per 1,000, among the seamen at home, who generally are young men entering the service, it is less than that of the general population at the same ages; but it must be remembered that the disadvantage of foreign service is more than compensated by the constant removal of the weak and sickly men by invaliding, both from the army and navy. How largely the apparent rates of mortality are reduced by this process may be inferred from the fact stated by Sir Alexander Tulloch, that among the men discharged from the army on temporary pension the deaths are no less than 119 per thousand per annum. The amount of loss to the army by death and by invaliding is well illustrated by the series of diagrams by Dr. Farr, which are to be found in the Appendix P. Q. 6391.

Causes of Mortality.

This excessive mortality should in some way be accounted for. The collecting together of great numbers of men has always been found to generate disease, because they were probably in excess of what a given locality could accommodate or for which the sanitary precautions of the district were originally calculated. That in war men should die from exposure, from fatigue, from insufficient supplies, is intelligible; or that the occupation of a town of 30,000 inhabitants by an army of 30,000 men, without any sanitary precaution, suddenly doubling the population to the area, and thereby halving the proportion of every accommodation, supplies, water, drainage, sewerage, &c., &c. should engender disease, is readily understood; but the problem submitted to us is to find the causes of a mortality more than double that of civil life among 60,000 men, scattered in numbers seldom exceeding a thousand in one place among a population of 28,000,000, in time of profound peace, in a country which is not only the healthiest, but which possesses the greatest facility of communication and the greatest abundance of supply in Europe.

The causes assigned to us for these high rates of mortality are:—

1. Night duty.
 2. Want of exercise and suitable employment.
 3. Intemperate and debauched habits among the soldiers.
 4. Crowding and insufficient ventilation, and nuisances arising from latrines and defective sewerage in barracks.
- Q. 4207. 5888.

Without rejecting any cause which may contribute in any degree to the deterioration of the health of the soldier we are, after a careful investigation of the subject, disposed to attach little comparative importance to the first head. The comparison with the police who perform a night duty far more severe and yet have a rate of mortality of only one half that of the infantry of the line and less than one half of that of the Guards, seems to support our conclusion. It has been stated, however, that practically the service of the police lasts on an average but five years, owing to the frequency of invaliding or resignation on account of ill health, whereas the average service of the soldier is considerably longer.

Taking, however, the first five years of a soldier's duty, namely from 20 to 25 years of age, assuming that some months have been spent in drill, and comparing it with the five average years of the policeman who begins his service at 25 (a comparison in which the relative age is in favour of the soldier), we find that the mortality in the infantry of the line is 17·8 per 1,000, and in the Guards 20·4 per 1,000, against 8·92 per 1,000 in the police.

It appears, likewise, that when the Guards were engaged in the suppression of the outbreak in Canada, in 1838, their rates of mortality, which at home are in excess of those of the infantry of the line, upon that occasion fell below them. The mortality in the line during that period, in Canada, being 16·5 per 1,000 per annum, and that of the Guards 14·5 per 1,000.

The second division of the subject assigns a cause of disease and mortality to the existence of which, without the evidence which we are enabled to adduce upon the subject, many would be indisposed to give credence, viz., the want of exercise and suitable employment.

Of all classes of this country, including trades, occupations, and professions, and including also what may be called the affluent or easy classes, the longest lived is the agricultural labourer. He is neither the best fed, nor the best clothed, nor the best housed man in the country. In many districts he is quoted, and truly quoted, as the reverse. But the one condition in which he differs most from all other classes is the amount and the variety of exercise which he takes in the open air.

Throughout the tables, showing the rates of mortality in different trades and occupations, those whose avocations require much exercise, whether in doors or out of doors, have almost invariably a decided advantage over those requiring less muscular exertion. The rates of mortality of the cavalry of the line, as has been already shown, are but 13·6 per annum in a thousand, as against 17·9 in the infantry of the line; and this difference, we believe, is in some degree attributable to the greater number of hours passed out of doors on duty by the trooper, the variety of exercise which he takes,—part of his duty being on horseback, part on foot,—and the amount of muscular exertion required of him in grooming his horse, which is far greater than any exacted of the infantry soldier. His stable duty, as well as his sword exercise, calls into activity a different set of muscles to those exercised by men in marching. Indeed, all the attitudes of the foot soldier on parade, at drill, and on the march, are singularly monotonous and constrained, and it is rare to see an infantry soldier whose figure is as fully developed or as well set up as that of the cavalry soldier.

Colonel Lindsay, speaking of the soldier's daily life, says that—

Stat. Rep. on
Sickness and
Mortality of
Troops 1853,
p. 13.

Evid. Q. 6405.

Q. 5851.

"Perhaps no living individual suffers more than he from ennui. He has no employment, save his drill and his duties; these are of a most monotonous and uninteresting description, so much so that you cannot increase their amount without wearying and disgusting him. All he has to do is under restraint; he is not like a working man or an artisan; a working man digs and his mind is his own, an artisan is interested in the work on which he is engaged; but a soldier has to give you all his attention, and he has nothing to show for the work done."

Q. 5859.

Q. 5853.

This is the manner in which his day is spent by the private in the Foot Guards:—

"He gets up at six. There is no drill before breakfast; he makes up his bed and cleans his things; he gets his breakfast at seven. He turns out for drill at half-past seven or eight; his drill may last an hour and a half. If it be guard day there is no drill, except for defaulters. The men for duty are paraded at 10 o'clock; that finishes his day's drill altogether. There is evening parade, which takes half an hour; and then his time is his own till tattoo, which is at nine in winter and at ten in summer. That is the day of a soldier not on guard, or not belonging to the company which is out for *minié* practice."

Of the hours which the soldier has to himself he spends a very small portion in exercise or out of doors; and Colonel Lindsay, the Quartermaster-General, and Generals Mansell and Lawrence, all recommend that every encouragement and facility should be given to the soldier to practise athletic and out-of-door games and sports, as necessary both for his physical and moral health.

3151.
5861.

In the French army these considerations are so entirely recognized, and so great is the importance attached to them, that not only are the soldiers made to pass through a certain course of gymnastic exercises, but among the duties prescribed in the instructions for the medical inspectors is that of inquiring into the practice of these exercises in their districts. We are therefore inclined to place want of exercise, and especially of that species of exercise which useful labour supplies, and which would brace and develop the chest and frame, among the causes of the sickness and mortality of the infantry soldier.

The low rate of mortality in the navy, in which service the men, though necessarily berthed in a very confined space, undergo an immense amount of exercise, calling the greatest variety of muscle into play, and pass a large proportion both of day and night in the open air, appears to favour the opinion we have here expressed.

As regards the third head, namely, intemperance, if by intemperance be meant drinking to intoxication, we have no reason to think that the soldier is more intemperate than the average of the class from which he originally comes. He has no large sum paid weekly into his hands, with which to spend one or two days in drunkenness, if he were so inclined; nor, with the vigilant discipline exercised over him, could he do so with impunity. But that the soldier frequently indulges in the use of stimulating liquors, to an extent which may injure his health, though not deprive him of his senses, cannot, we think, be denied.

See Tables Con.
Vital Statistics,
p. 222.

Mr. Neison states that the results of an inquiry made into the rate of mortality amongst persons of intemperate habits show that at ages corresponding to those of soldiers there is, relatively to the deaths from all other causes, an excessive development of diseases of the "nervous system," and of the "digestive organs."

In England and Wales these two groups of diseases, at ages from 20 upwards, constitute 15·95 per cent. of the deaths from all causes; but amongst intemperate persons Mr. Neison asserts that they form 50·4 per cent. of all the deaths that take place, being more than three times the general average. These diseases may, according to him, therefore, be regarded, to some extent, as distinctive types of the causes of death

amongst intemperate persons, and their paucity or predominance would, in his opinion, fairly lead to inferences as to the general regularity or irregularity of the previous habits of the persons whose deaths they caused.

But the proportion of deaths in the army by diseases of the nervous system and digestive organs as compared with those caused by diseases of the respiratory organs will be seen in a table in the Appendix, which gives likewise the deaths from similar causes in the general community in particular districts, and among intemperate lives.

It appears from that table that the higher the mortality of the different branches of the service the greater is the relative amount of deaths caused by diseases of the respiratory organs; in other words, in the household cavalry, which is the healthiest service, the deaths by diseases of the nervous system and digestive organs are as many as one-fifth of those caused by diseases of the respiratory organs, while in the Foot Guards, which is the unhealthiest, they constitute but one-eleventh.

Mr. Neison does not, we apprehend, intend to assert that the test which he has employed is conclusive or of uniform value. He admits that intemperance frequently leads to pulmonary disease. All that he intends to convey, if we rightly understand him, is that, taken over whole classes and over large numbers of men, as in the army, the predominance of these two causes of death may fairly lead to inference as to general temperance or intemperance, so far as indulgence to excess in strong liquors is concerned. Even with these qualifications, however, we are unable to adopt the conclusions at which Mr. Neison has arrived. We shall presently show how much the soldier suffers from over-crowding and deficient ventilation in barracks, evils which have a direct tendency to promote that pulmonary disease which is the principal cause of mortality.

That the health of the army, like the health of the working classes in this country, would be much improved by greater abstinence from strong liquors, appears to us indisputable. We doubt, however, whether there is now such a difference in the habits of the soldier and those of the labourer or the mechanic in that respect, as would account for the extraordinary excess in the rates of mortality of the former over those of the latter.

There is, doubtless, a greater amount of dissipation of other kinds among soldiers than among young men of the same class in civil life. Their residence in towns offers great temptation and great facilities for sexual debauchery; and the diseases which are thereby generated,—the existence of which the soldier, from one cause or another, frequently conceals, thereby greatly adding to the intensity of the malady, and the difficulty of cure, as well as to the necessary severity of the treatment,—no doubt have a most injurious effect on his constitution.

There remain to be considered the effects on the health of the army of overcrowding, of insufficient ventilation, of defective sewerage, and of other noxious agencies of analogous character in barracks, and before doing so we deem it right to call attention to the influence of pulmonary affections on the mortality of the troops, as compared with the mortality occasioned by the same diseases in civil life.

The following table shows the total annual mortality per 1,000 of the troops of different arms, and of civilians in 24 large towns, at the soldiers' ages, by different diseases, and the proportion of deaths caused in either case, by chest and tubercular, as distinguished from other diseases.

Ratio of Deaths per 1,000 of mean strength by—	Household Cavalry.	Dragoon Guards & Dragoons.	Foot Guards.	Infantry of the Line.	Civil population of 24 large Towns.
Inflammation of the Lungs, Pleurisy, and Acute Catarrh -	·2	·7	1·3	1·3	·5
Spitting of Blood, Consumption, Chronic Catarrh, } Asthma, and Difficulty of Breathing - - - }	6·4	6·6	12·5	8·9	5·8
All Causes - - - - -	11·1	13·6	20·4	17·9	11·9

From this table it appears that while in civil life at the soldiers' ages, the deaths by pulmonary diseases are 6·3 per 1,000, they amount in the cavalry to 7·3; in the infantry of the line to 10·2; in the guards to 13·8 per 1,000, and that of the entire number of deaths from all causes in the army, diseases of the lungs constitute the following proportion; namely, in the cavalry 53·9 per cent.; in the infantry of the line 57·277 per cent.; in the guards 67·683 per cent.

It may be stated that in civil life insufficient clothing, insufficient and unwholesome food, sedentary and unwholesome occupations, and the vitiated atmosphere of unhealthy dwellings, all contribute to the propagation of this class of diseases. But in the army it cannot be alleged that the clothing, the food, or the nature of the occupation in itself are

Q. 9561.
Q. 9570.

Stat. Rep. on Sickness and Mortality of Troops, 1853, p. 20 and App. No. ii.

of a character which would justify the imputation that they are among the predisposing causes of the excessive mortality of the soldier by pulmonary disease.

Table p. 20.
Stat. Report on
health of army.
1853.

If, therefore, it can be shown that the soldier in barrack breathes a vitiated and polluted atmosphere, it follows that of the four predisposing causes above enumerated, the last is the one to which the excessive liability of the soldier to this class of disease may be chiefly attributed. Many of the diseases, however, included under the general head of chest and tubercular diseases are not of a character to be directly attributable to the breathing a vitiated atmosphere. These, as we have already shown, are estimated to produce a mortality of 13·8 in the Guards, and of 10·2 per 1,000 in the infantry of the line, as compared with 6·3 per 1,000 among males of the same age in civil life in 24 large towns; or, according to the Registrar General, who adopts a slightly different classification, 10·1 as against 4·5 per 1,000 in the civil population generally at corresponding ages. But excluding inflammation of the lungs and pleura, acute catarrh, and some other diseases which may have no obvious connection with the purity or impurity of the atmosphere, and confining ourselves to consumption, chronic catarrh,* spitting of blood, asthma, and difficulty of breathing, we find a mortality of 12·5 in the Guards and 8·9 in the infantry of the line.

This one cause alone, therefore, acts with such intensity, especially when superadded to a certain amount of exposure, as not only to produce in the Foot Guards an amount of the disease in question which is greater than is produced in civil life by all the four causes united, but which actually carries off annually a number of men in the infantry nearly equalling, and in the Guards actually exceeding, the number of civilians of the same age who die of all diseases put together. These facts are clearly shown by the Diagram G, Appendix No. lxxii., by Dr. Farr.

App. lx xii.

Even here, again, it must, however, be remembered that the returns of death occasioned by pulmonary affections in the army do not present the whole amount of mortality caused by this class of diseases, a large number of men being constantly invalided and discharged from the army when incapacitated for duty by the progress of the malady.

The facts above stated lead us to the conclusion that the ravages committed in the ranks of the army, by pulmonary disease, are to be traced in a great degree to the vitiated atmosphere generated by overcrowding and deficient ventilation, and the absence of proper sewerage in barracks; and we shall think it our duty presently to describe the existing state of our barracks before suggesting the alterations which appear to be necessary to obviate the formidable evils which we are satisfied are attributable to their present condition.

It has been stated to us, as a fact so singular that it deserves further inquiry, that the only army in which the mortality does not much, if at all, exceed that of the population from which it is drawn, so far as the latter can be ascertained, is the native army in India, whose rates are slightly lower than those of the native civil population of those districts in which the rates of mortality are known.

It is also the only army with which we are acquainted which is not barracked. The sepoy receives a small sum under the name of hutting money, with which each man erects for himself a rude construction with mats and other articles of a similar character; and he frequently sleeps outside of the hut so erected.

It is also a fact worthy of notice, that the mortality of the army when hutted before Sevastopol in 1856, as compared with that of the troops at home, was nearly one-third less than the mortality of the infantry of the line, and two-fifths less than that of the Foot, Guards when barracked in England. The numbers are as follows:—

The mortality of the army before Sevastopol, during 22 weeks ending May 31, 1856, was, including deaths by violence or accident, at the rate of but 12·5 per 1,000 per annum, as against 17·9 in the infantry and 20·4 in the Guards when quartered in England.

Perhaps no army was ever better cared for, or more sanitary precautions taken in its behalf as regards drainage, both of surface and subsoil, cleanliness, ventilation of huts, diet, clothing, &c., than the army before Sevastopol, during the period mentioned. In the month of May alone the mortality was at the rate of only 8 per 1,000 per annum.

* "It has been found necessary to include chronic catarrh with phthisis and the non-inflammatory affections of the lungs, as, on examination of the Reports, most of the deaths were found to have been really cases of consumption. — *Statistical Reports on the Health of the Army*, 1853, page 20. This statement has been fully corroborated by the results of the post-mortem examinations made at Fort Pitt.

Rep. San.
Com. p. 193,
Q. 9497.

Again, the cavalry at home, whose rates of mortality are lower than those of any of Your Majesty's troops, are generally less crowded in their barracks than the infantry; the reduced strength of the cavalry regiments leaving greater space for the accommodation of each man.

In considering the effect on health of the constant breathing of a vitiated atmosphere in barracks, it must be borne in mind, that 57·277 per cent. of the deaths in the infantry of the line are caused by diseases of the respiratory organs, and of the Guards no less than 67·683 per cent.

With these general observations we now pass on to the consideration of the existing arrangements for lodging the soldier.

Barracks.

In 1855 a committee composed of a Lord of the Treasury, three army officers, of whom one was in the Grenadier Guards, a colonel of Militia, two officers of the Royal Engineers, a medical officer, and Sir Joseph Paxton, was appointed to examine into the existing construction and arrangements of barracks, and to report what changes and improvements they considered necessary. We are informed, that the new barracks erected since that date, afford very superior accommodation to those previously built, but it does not appear that any important steps have been taken towards supplying the deficiencies of the older buildings, and some of the most serious evils remain still unremedied.

The dormitories or barrack rooms are very confined, the minimum cubic space allowed to each soldier by regulation being only 450 feet, and a reference to the returns numbered xxxv. and xxxvi. in the Appendix will show that in a majority of cases even this minimum is not attained, and that in a number of barracks there is a deficiency of one third, and in some instances of more than one half of the space allotted by regulation. Sir John McNeill states that the pauper in the Scotch workhouses is allowed 480 feet per bed, and not only is this minimum rigidly insisted upon, but the houses being scarcely ever full it is practically much exceeded, and the pauper is never in his dormitory during the day. In the barrack, on the other hand, it is stated by some non-commissioned officers examined by the Barrack Committee, that even the regulated space of one foot between the beds is practically unattained; and all experience goes to prove, that the amount of interval allowed between the beds is of more consequence, so far as health is concerned, than the mere amount of cubic space given above by the altitude of the room. Owing to the ordinary construction of the buildings, the barrack rooms very seldom have windows at opposite sides or ends of the room, and there are, consequently, very insufficient means of ventilation, though the number of men sleeping together in a confined space, renders every access to fresh air the more necessary. Even where ventilators exist, they are frequently stopped up by the men themselves, who, come from a class very little persuaded of the advantages of ventilation, and whom poverty has accustomed from their youth up to look to the exclusion of the external air, in the absence of fuel, as the best mode of securing warmth. Barrack-rooms are occasionally found in the basement of the building, approached by descending steps from the natural surface level, the tops of the windows, which open on one side only of the rooms, being little, if at all, above such surface level; and in low rooms thus situated a number of men may be found lodged in beds so closely ranged that the side of one touches the side of the other. The result is, that the soldier sleeps in a fœtid and unwholesome atmosphere, the habitual breathing of which, though producing for the most part no direct immediate effects, probably lays the seeds of that pulmonary disease which is so fatal in the British army. Of the state of this atmosphere, abundant evidence, though of a most disgusting nature, is to be found in the statements of the witnesses before the Barrack Committee.

Colour-serjeant Reynolds being asked, "Did you observe any ill effect arise to the health of the men, or to their spirits, in consequence of the atmosphere in which they were shut up at night?" says, "There used to be frequent complaints; there was a good deal of coughing, and it used to cause a phthisicky sensation in the throat, and spitting in the morning."

Again, Serjeant Brown is asked—

"Have you often gone into the men's rooms in the morning before the windows were open?—Yes.
"In what state did you find the atmosphere?—In a very thick and nasty state, especially if I came in out of the air. If I went in out of my own room sometimes, I could not bear it till I had ordered the windows to be opened to make a draught."

"I have often retired to the passage, and called to the orderly man to open the windows. The air was offensive both from the men's breath and from the urine tubs in the room; and, of course, some soldiers do not keep their feet very clean, especially in summer time."

It must be remembered that this is not the evidence of men accustomed to the refinements of life, but of non-commissioned officers drawn from the same class as the soldiers themselves. We cannot too strongly condemn the nightly introduction of these urine tubs into the rooms in which the men sleep. Besides the indecency generated by their use, the stench proceeding from a wooden vessel saturated with urine is most prejudicial to health. Nor can any necessity be shown for this filthy practice. Colonel Lindsay states that in the small barracks at Windsor earthenware vessels were used obviating all the evils above alluded to, and no inconvenience ensued beyond two or three breakages, which were paid for as barrack damages; and Dr. Balfour has successfully abolished the nuisance in the dormitories of the Duke of York's school, substituting slate urinals, with water running through them, and separated by doors from the dormitories.

In the Report of the Barrack Committee we find the following recommendations :—

“ Attached to the sleeping apartments of each company there should be an ablution room, fitted up with tin basins, and water laid on; in this room there should be a portion boarded off, divided within into two or three closed spaces, with foot-pans, where men could retire from the view of their comrades for the purpose of washing their entire persons.

“ It has also been suggested that a washing establishment sufficiently large for the purpose of washing, not merely the wearing apparel of the men, but also their bedding, should be built, and that it should be provided with the improved mechanical contrivances for washing and drying clothes. It has also been stated to be of great importance that a drying-room should be specially set apart for drying the great coats and other outer garments of the men when wet.”

With both these recommendations we cordially concur.

There are other cases to which we need not here allude, in which regard for decency and for the self-respect of the men requires that alterations should be made, of which the cost would be little more than nominal. But we must observe, that to the state of the latrines, the cesspools, and the drains, is probably to be attributed much of the excess of mortality by fever which the army statistics show over that arising from the same class of diseases in civil life; their respective rates being, deaths by fever in civil population in towns 1·2 per 1,000; in the cavalry 1·4; in the Guards 2·4; in the infantry 2·5; and in the artillery 1·9 for the ten years ending 31st March 1857.

It must be remembered that in the barrack-rooms, the atmosphere of which we have described, the men are expected to take all their meals, and the number of hours they spend in them during the day makes their thorough purification before the return of night almost impossible.

We are strongly impressed with the insufficient provision made in barracks for non-commissioned officers and married soldiers.

By a return of the barracks and encampments occupied by Your Majesty's troops on the 1st January 1857, lately presented to Parliament, it appears that out of 251 stations, at twenty only is there any separate accommodation provided for married soldiers. At Dover it consists of rooms 12 feet 7 inches long by 7 feet broad and seven feet high, affording a cubical space for a whole family of little more than 600 feet. At Woolwich a staff-serjeant with his wife and five children sleep and live in one room in which all the household labours are performed. In the casemates at Chatham the overcrowding is greater and the decencies of life are still less regarded.

The Barrack Committee recommended the establishment of a day room in barracks. They considered that the custom of taking his meals in the same room in which he sleeps is productive of a want of cleanliness in that room, and is calculated to retard the growth of those improved social habits which an increased attention to his moral and physical wants will engender in the private soldier. Some doubts, however, had been expressed by witnesses whom they had examined, whether the men would find any use for them or prefer them to the barrack-room in which they sleep. A similar doubt was expressed to us by a distinguished officer, whom we examined; but Colonel Lindsay, than whom no officer takes a greater interest in or is more conversant with the feelings of the men, states that in the Guards they have had practical experience on this matter. It appears that before the new part of the Wellington barrack was occupied, the battalion quartered in the old part had the temporary use as a day room of the new and unoccupied school room, a room 50 feet by 30, but, large as it is, the room was crowded both in the evening and during the day, so that there was not space for the men.

Colonel Jebb, at the request of the Commission, has prepared a plan of a barrack-room, in which each man is screened from his neighbour by a bulkhead of corrugated iron, about six feet in height, but with six inches next the ground left open for ventilation.

This bulkhead would not project more than four feet from the wall, so that no bed could be unoccupied without being observed. Underneath the barrack-rooms thus arranged it is proposed to place a large day-room, divided, if thought necessary for greater comfort, into four compartments by corrugated iron bulkheads. These day-rooms should, with the rest of the barrack, be well warmed, and lit by gas where it is possible, otherwise by a sufficient supply of lamps, the present allowance of light in reading rooms being far too small; and an ample supply of common forms and tables should be provided.

Q. 4033-9.

We may here observe that the cost of the accommodation for the men in a barrack amounts but to one-fourth of the whole. Thus, if a barrack with all its appurtenances cost at the rate of 100*l.* per man, 25*l.* would be the sum appropriated to the barrack-rooms, the remaining 75*l.* being devoted to officers' quarters, offices, canteen, library, guard-room, punishment cells, parade ground, fives court, boundary wall, &c., none of which things, except a proportion of the offices, would be necessary to the lodging of a man of the same class in civil life.

Q. 5148.

It is only upon this fourth part of the whole cost of a barrack, that any increase of outlay would be required to give the additional or better-arranged accommodation which the health of the men imperatively requires. It must be recollected, also, that nothing is more costly to the public than the annual loss of men from ill health and mortality; and though the saving which would result from a better system be indirect, and therefore difficult to estimate, yet we feel satisfied, looking at the question as a matter of finance alone, that money judiciously laid out in promoting the health and comfort of the soldier makes an ample return to the public.

It should also be recollected that it is indispensable, as the basis of all the training by which the moral standard of the army can be raised, that the soldier should be made comfortable in his quarters, and not driven to spend his time in places where nothing but evil can accrue to him.

Q. 5249.

Q. 5146.

Encampments.

Upon the subject of encampments, and of the selection of ground which, while affording facilities for the procuring of wood and water, is at the same time, from its position, soil, sub-soil, and exposure, free from influences likely to prove prejudicial to the health of the troops, evidence both oral and documentary was submitted to us. There is no doubt that it requires not merely theoretical scientific knowledge, but the power and habit of rapidly applying it, to enable a man to judge of the comparative value, in a sanitary point of view, of different available positions.

Q. 3167.

The Quartermaster-General informs us that there is no standing order or regulation making it imperative on the commanding-officer in the field to consult the medical officer on such subjects, though he is of opinion that such a regulation is certainly necessary; neither is any provision made for entrusting to any competent officer the cleansing, and preparing in a sanitary point of view, a town about to be occupied by a force, perhaps greatly exceeding its population, as was the case at Balaklava, where no provision was at first made for cleansing and draining, or the prevention and removal of nuisances in a sea-port town, though some 20,000 men were passing in and out daily; where the transport animals of the army were entering the town, and no means were devised for safely disposing of the manure; where cattle were slaughtered for the town and shipping, and no slaughter-houses were provided; and where there was a horribly offensive burial-ground, in which the dead of the previous winter had been laid almost in water and hardly covered with earth, so that fragments of limbs and clothing protruded above the surface. There being no regulation on these subjects it naturally follows, that the degree of respect shown to medical opinions on matters affecting the health of the troops, whether concerning personal hygiene, such as food and clothing, or the larger and more difficult subjects of barracks, hospitals, or camps, depends solely on the good sense and capacity of the officer in command, and on the tact and ability of the medical adviser. If the commanding officer be inexperienced and not sufficiently well informed to be conscious of his ignorance in such matters, he does not ask for the opinion of the medical officer, and considers it intrusive if offered. On the other hand, the best and most experienced officers in the service, knowing the value of such advice and assistance, never fail to seek it and to be guided by it, unless, indeed, the estimate which they may have formed of the knowledge and good sense of the medical officer be such as not to inspire confidence in his opinion.

Q. 3170.
3208.

Q. 2344-52.

Q. 3168.
2434.

In war, occasions must constantly occur, when no sanitary opinion can be set in the balance against strategical considerations, and loss of life by disease must be risked, as it is risked by the enemy's fire, in order to seize or hold a position on which the success of a military operation depends.

On such occasions it is still right that the medical opinion should be given in order that the commanding officer may have before him every consideration which should be weighed before he makes his decision, and it is right likewise that the opinion should be disregarded when the importance of the object to be attained is greater than the sacrifice it entails.

But if, in such a case as that supposed, it is for the interest of the service that an opinion should be tendered, it must not be allowed to depend on the character and disposition either of the commanding officer or the medical officer whether the opinion on which the lives of men may depend should be asked or offered. The duty and the responsibility of both should be defined by regulation. The medical officer should be made to feel that, charged as he is with the care of the troops in health, as well as with their treatment in sickness, he is responsible for any act or any omission which his advice or warning would have prevented; and the commanding officer should be made to feel that he is responsible for disregarding that warning or over-ruling that advice, and should have sound reasons to show for the course taken.

Under the existing system the medical officer is required by the regulations to examine the ventilation and cleanliness of the barracks and quarters, and to suggest improvements to the commanding officer, sending a copy of such suggestions to the Director-General. He is also required, upon the occurrence of cholera or any other formidable disease, to report to the Director-General his opinion as to its cause, and the treatment adopted. But no power is given him to carry into operation any of the measures he may deem necessary, nor is there any regulation authorizing him to press upon his commanding officer the adoption or even the consideration of his suggestions if the latter be not disposed to consult him. There is in this respect a total, and, as it appears to us, injurious want of connection between the medical and executive departments of the army.

By the arrangements which we shall have to propose for introducing a knowledge of sanitary science and military hygiene, as an essential part of the education of the military medical officer, he will be placed in a much more advantageous position, both as regards his competency to give advice, and the willingness of others to follow it when given.

But to secure this result, we are of opinion that the advice should be given in writing; that the reasons for disregarding it, if disregarded, should be endorsed upon it by the officer who rejects it, and that the document should be recorded and copies forwarded to the superior military and medical authorities.

We hold this rule to be equally applicable in peace or war.

How necessary such a regulation may be in peace is shown by three instances quoted in his evidence by Dr. Balfour, and which came under his own observation while assistant surgeon in the Guards. For many years the pestilential state of the Tower ditch was represented by the medical officers of the Guards as a cause of the great prevalence of fever in the garrison. The military authorities, however, declined to drain the ditch, and the nuisance remained undisturbed till, after some years, the alarm created in the minds of the inhabitants of Tower Hill by the extent of typhus prevailing in the garrison induced them to reconsider the question. The ditch was drained, and the type of fever has since been much mitigated and the cases have diminished in frequency.

A supply of good water has in the same way been introduced, after the remonstrances of the medical officers had been for years neglected, during which time the men used water taken from the Thames immediately opposite the Tower, and filtered through gravel, but which remained so full of animalcules that a witness stated he avoided using it even for washing until it had been boiled.

Again, when it was proposed for health's sake to move the men from the old into the newly-erected barrack in the Tower, in which some stores, consisting chiefly of blankets, had been temporarily placed, and to transfer the latter to the quarters vacated by the men, the proposal was negatived on the ground that the blankets would be injured by the damp. Fortunately this objection was brought under the notice of the Duke of Wellington, and the new barrack was given up to the use of the troops.

If at the head-quarters of the British army and in the Queen's Guards sanitary precautions can be so neglected, it scarcely requires evidence to establish the necessity of enforcing greater care in this respect on other and more distant stations.

Speaking of the colonies, and that at a recent date, Mr. Alexander says,—

"I made a tour of inspections in Canada, in October last; at Toronto I found a privy, the effluvia from which was much complained of, and fit to knock you down at times. The commanding officer and surgeon brought the case before me, stating that they had frequently reported it, and wished to have it remedied; the simple remedy was, to shut it up, and erect another over the lake. There

App. lxiv.

Q. 2561.

was another case of a slight leakage, at the hospital at Kingston citadel; it had been reported several times, and not attended to. There was also a drain leading from the privies at Kingston citadel in a most offensive state, and out of repair. A board had sat, and reported its state recommending that the rain falling in the barracks should be collected into tanks, and the privies sluiced occasionally; but months had passed without the recommendation being carried out. I brought it to the notice of the general commanding, and before I left I was informed that it was about being remedied."

In war, when the necessity for sanitary precaution is much greater and the practical application of sanitary knowledge to unforeseen exigencies is more difficult, it appears to us hopeless to charge the principal medical officer, already engrossed by the overwhelming duties imposed upon him, with functions which require not only the whole vigilance of one man, but his constant personal superintendence over, perhaps, a wide extent of country.

There is also another reason for placing the duties of an officer of health in other hands than those of the principal medical officer of the expedition.

In civil life sanitary science as yet is neither much studied nor widely spread, nor has the value of its practical application to the ordinary conditions of life obtained any very general acquiescence. While the tendency to fuse together the practice of medicine and surgery has thrown almost the whole practice of the country (except that of the great towns) into the hands of the general practitioner, a subdivision of labour of another kind has simultaneously been gaining ground in the medical profession. The study of sanitary science has been taken up as a specialty, and the field has been abandoned by the mass of the profession to be exclusively occupied by those who so study it. The names of those eminent in either branch are perfectly well known to the public, who employ the one or the other according as they want individual sickness treated or public sickness prevented. It is rare to send for the health officer to treat sickness, or to employ the eminent practising physician or surgeon to drain a town or to guard a district against the approach of cholera.

The fusion between the medical and surgical specialties is, in the Army Medical Department, even more complete than in the civil profession; and if efficient sanitary officers are to be obtained, it will be by the encouragement offered by Government to the army medical officers to make themselves thoroughly masters of the specialties of that branch of the medical art and its practical application.

We hold that the medical staff of an army in the field is incomplete which does not include in its ranks a sanitary officer, second in rank to the principal medical officer, and attached to the Quartermaster-General's department. This officer should be the head of the sanitary police of the army, should be responsible for all measures to be adopted for the prevention of disease, and should report to the Quartermaster-General and to the principal medical officer.

We feel confident that had such an officer been appointed at the commencement of the late war, with instructions defining his duties and responsibilities, as well as those of the military authorities in respect to him, much of that mortality which was occasioned by the absence of sanitary precaution, both in the Crimea and on the Bosphorus, would have been prevented.

Something more, however, is necessary than merely providing for a thorough knowledge of sanitary science on the part of Army Medical Officers. Such knowledge, in most instances, can only become available through the agency of the Officers of the Royal Engineers; and, as sanitary engineering is a specialty, it appears to us that it would be highly advantageous to the Army were this branch of the science included in the course of instruction required of the Officers of that Corps.

Ration.

The ration of the British soldier consists at home of 1lb. of bread and $\frac{3}{4}$ lb. of meat, at which rate it was fixed so far back as 1813, and has never since varied, except that by a Warrant dated February 1833, an additional $\frac{1}{2}$ lb. of bread was given to troops encamped in England. App. xxvii.

Abroad, the ration consists of 1lb. of bread or $\frac{3}{4}$ lb. of biscuit, and 1lb. of meat, either fresh or salt, the additional $\frac{1}{4}$ of a pound being given to compensate for the inferior quality of foreign compared with English meat. There are, however, two exceptional rations still given, one at Hong Kong, and the other at certain out-post stations at the Cape of Good Hope. See App. xxvii.

A reference to the paper marked xxvii. in the Appendix, will show the great variety both in the amount and composition of the ration which has been from time to time authorized in the Colonies, the frequent changes in the stoppages both at home and abroad at various periods, and the different systems on which the ration has been contracted for and supplied to the troops.

We may mention, however, that previous to the Warrant of 1850, by which the stoppage was fixed at $4\frac{1}{2}d.$ at home and $3\frac{1}{2}d.$ abroad, the soldier paid at home a sum varying with the cost of the ration at the place where he was supplied, provided it did not exceed $6d.$, the Government defraying any cost beyond that sum if it happened to exceed it. Thus there was a different rate of stoppage enforced in different parts of the country, according as the markets were high or low, and the balance of pay accruing to the soldier varied according as he was quartered in a high or low priced district. Abroad, though the materials and cost of the ration varied, the stoppage was uniform at $5d.$

The ration was supplied abroad by the commissariat; in England, by the Board of Ordnance from 1834 to 1854, when the supply was transferred to the commissariat; and in Ireland, by the commissariat from 1847 till 1852, from that year till 1854 by regimental contract, and since that date again by the commissariat. The Artillery and the Guards preserved the system of regimental contract to a later period than the line; but all the troops are now supplied by the commissariat, and a uniformity of system in that important particular has been established.

The ration on board ship is the same as the seaman's, for which the soldier is charged $6d.$, in consideration of its superior value, or $5d.$, if he does not take grog or any substitute.

In hospital the stoppages are, in peace :—

$10d.$ at home,

$9d.$ abroad ;

in the field there is no hospital stoppage, beyond that of $3\frac{1}{2}d.$ for the ration.

There is no doubt that the frequency of the changes made in the authorized ration since 1813, and of the stoppages by which the soldier paid for its value, and the great diversity in the balance of pay to which he has been entitled according to the station at which he might be quartered, have been sources of suspicion and dissatisfaction to him.

The Warrant of 1850 had the merit of equalizing his stoppage almost throughout the world, for as the soldier receives $13d.$ pay at home, including $1d.$ for beer money, and only $1s.$ abroad, the $4\frac{1}{2}d.$ stoppage at home and the $3\frac{1}{2}d.$ abroad are, as compared with his gross pay, an equivalent stoppage, leaving the same net balance to him in both cases.

There are, however, still the two exceptions already quoted to the uniform ration and stoppage, namely, at Hong Kong and in South Africa, where additional articles of food are supplied, for which the soldier pays one penny at the former and three half-pence at the latter station.

But the $\frac{3}{4}lb.$ of meat and $1lb.$ of bread at home, and the $1lb.$ of meat and $1lb.$ of bread abroad, with the stoppages of $4\frac{1}{2}d.$ in the one case and $3\frac{1}{2}d.$ in the other, by no means represent either the amount of food daily consumed by the soldier, or the amount of money which he pays for it. Indeed a mere bread and meat ration, even if increased in quantity, could never ensure health, without the addition of vegetable food.

Some years ago the practice of having a third meal in the afternoon was introduced into some regiments by commanding officers, who paid much attention to the health and well-being of their men, the expense being defrayed by a stoppage made by consent in the regiment. Up to that time the soldier had but two meals, breakfast at half-past 7 and dinner at half-past 12; there remained therefore an interval of 19 hours during which the soldier might be altogether without sustenance; and though in most cases he probably obtained a meal at his own expense, the soldier had no guarantee that he got it at the lowest cost, nor had the public any security that the meal was the best or the wholesomest that could be provided for him.

The good effect of the introduction of this third meal on the discipline as well as the health of the men was remarkable. The meal acted as a roll-call, bringing men back into barrack towards evening; while the substitution of solid food for the dram to which exhausted men had recourse diminished drunkenness.

The success of this experiment induced the extension of the system through the whole army, and commanding officers were enjoined to see that their men were supplied with a third meal, provided always the commissariat and regimental stoppages together should in no case exceed, for rations, messing, and washing,—

$8\frac{1}{2}d.$ in the Guards and Infantry, } per day.
 $10d.$ in the Cavalry and Artillery. }

From the evidence of the non-commissioned officers it appears that the washing has usually cost—

In the Guards -	$6d.$	per week
„ Infantry	$3\frac{1}{2}d.$	„
„ Cavalry	$6d.$	„
„ Artillery	$7d.$	„

Under this system the men provide themselves with the additional articles for messing by companies in the infantry, by troops in the cavalry, and by rooms or messes in the artillery, selecting their own tradesmen, and giving their orders and settling their accounts through a non-commissioned officer. Q. 4642-g.

It is clearly the duty of the Government to see that the soldier is supplied with and consumes a diet so composed as to keep him, as far as possible, at all times and in all climates in health and efficiency.

The changes which we have described have in some degree tended towards this end; but they have attained it incompletely, and in a cumbrous and expensive manner, both as regards the soldier and the public.

There are, in fact, two sources of supply to make up the diet, and two systems of stoppage to defray the cost. Nor is the ration uniform in quantity; the Warrant by which the regimental stoppage is authorized, fixing the maximum only beyond which the soldier shall not be charged.

If from any accidental cause food be inordinately dear, the maximum stoppage will not purchase enough to keep the men efficient. If the markets are unusually low, some commanding officers nevertheless mess their men up to the full stoppage, irrespective of the price of provisions, lest a large balance of pay in the men's hands should afford means of indulgence and lead to indiscipline; while others are satisfied to procure their men a proper ration, and consider that the men have a right to dispose of the balance as they think fit. Q. 3950.

It appears also that in some regiments the men, weary of the monotony of eating boiled meat every day, and unable to bake it in barracks owing to the absence of any cooking implement but a copper, send out their ration to be dressed by a baker, whom they find means to pay by diminishing their allowance of vegetables, a practice which, looking at the composition of the ration, may be prejudicial to health. Q. 3894.
Q. 4217.
Q. 4692-4.

We have already mentioned that in some of the colonies the system of purchase by the men becomes impossible, owing to the absence of any sufficient market, and in such cases the commissariat supply the additional articles.

But a more signal instance of failure is to be found at the commencement of the war in the East. In Bulgaria there were no markets where the men could provide themselves, and they were apparently unwilling to purchase from the commissariat stores articles with the use of which they were not familiar, and consequently they were without any accessory to the bread and meat ration, which, however, was considerably increased; the commissariat then received orders to issue coffee and sugar, an additional stoppage of 1*d.* being ordered to defray the cost. This stoppage was continued so long as the commissariat had the power to supply a demand which was unusual and unexpected. Q. 3092.
Q. 3684-6.
Q. 6176.

The stoppages for rations during this period were frequently varying. The soldier the day previous to his embarkation was paying 4½*d.* to the commissariat and 3½*d.* to his regimental messing. On board ship he paid 6*d.* if he took grog or coffee in lieu of grog, or 5*d.* if he abstained; in Bulgaria, on arrival he paid 3½*d.* for his commissariat ration, and 3½*d.* for his regimental messing; and when this system broke down through the absence of any market in which the companies could supply themselves, the stoppage paid to the commissariat rose to 4½*d.*, while that for the messing was reduced to *nil.* But if the man were sick, and were sent down to Scutari to hospital, he then reverted to a 3½*d.* stoppage, having again paid 6*d.* or 5*d.*, as the case might be, on board the ship that conveyed him thither. Q. 3092-5.

We find in the Appendix to the report of the Crimean Commissioners a memorandum by Paymaster Hall Dare, of the 23d Fusiliers, in which, after describing the varieties in the authorized stoppage, he states that in the field,— See Crim. Rep. App. p. 18.

“It is impossible to ascertain the situation of every man even in a company on any particular day, and of course the difficulty is multiplied by taking a larger number of men for a month, at the end of which period every soldier should be settled with.”

Again he says,—

“A man in the course of the month may have been drawing rations in hospital at Balaclava, sent down to Scutari, and returned to camp. Except from the man's own statement, there is no paper to show what stoppage he is liable to since the day he left Balaclava Hospital. If,” adds Mr. Hall Dare, “these separate amounts of stoppage could be assimilated, it would be a simple proceeding to credit the public with a uniform rate for every day's pay charged; and as the soldier is probably fed by the country in some shape, these varieties of situation would be neutralized, and while it would not interfere with the Royal Warrants which regulate the amount of his pay, the public would be no losers by the arrangement.”

Again, Assistant Commissary-General Willan, after describing at length the various regulations under which the stoppages are effected in line and ordnance corps, observes:— See Crim. Rep. App. p. 18.

“From the foregoing regulations it is evident that an immense amount of labour and a great deal of valuable time is consumed without any apparent benefit resulting from it, and, in support

of this opinion, I need only quote one voucher in my abstract of receipts for the month of March, 1855, in settlement with the Ordnance Paymaster for ration stoppages for the Royal Artillery, which when rendered in quadruplicate, as required by the regulations, comprised no less than 348 half sheets of foolscap paper. The compilation and examination of this voucher occupied the whole time of one person for at least a week."

As regards a remedy for this evil, Mr. Willan arrives at the same conclusion as Mr. Hall Dare:—

"It occurs to me that this vast amount of labour might be greatly simplified by adopting one uniform rate of stoppage for all rations, and by the paymaster deducting the amount of the stoppage from the daily pay of the soldier."

And he adds,—

"This arrangement appears to be approved of by all paymasters to whom I have spoken on the subject.

"With regard to the stoppages for officers and their civil servants, it is a question for Government to decide, whether it would not be desirable to abolish them altogether, as the amount of them is, comparatively speaking, trifling compared with the labour required in collecting them."

A more serious objection is advanced by Colonel Gordon, Assistant Quartermaster-General in the Crimea, who says,—

See Crim. Rep.
App. p. 19.

"The present system relative to the issue of rations to the troops, and the receipts given for the rations issued, appears to be very defective, and to invite irregularity, if not fraud; because the receipt for the articles issued is given on the same paper and at the same time as the 'demand' for them. This would not much signify if the rations were always forthcoming, but it frequently happens otherwise, especially with forage; and when this is the case the receipts are of course incorrect. But as they are the vouchers for the correctness of the commissary's monthly abstract of issues, I expect it will be found that in many instances they are inserted in the abstract as they are signed for, and not according to the actual issue."

See App. xxviii.

In a memorandum by Sir C. Trevelyan, which will be found in the Appendix, he states his opinion that,—

"The stoppages from the pay of the soldier for the rations supplied to him involve settlements of accounts of so operose and cumbrous a nature that, although they are gone through in time of peace at the cost of an enormous waste of labour, the whole system is immediately abandoned at the breaking out of war."

In the Caffre wars our commissariat officers reported that they had been,—

"Unable to keep up the calculations which the system required in reference to the pay of every individual soldier belonging to the numerous detachments moving over the face of the country."

As regards the late war in the East the Crimean Commissioners came to the conclusion that,—

See Crim. Rep.
p. 47.

"By reducing the charge to one uniform rate, whether the soldier be doing duty on shore, or be in hospital or on shipboard, and making the balance of his pay the only matter of account, the whole of those difficulties would be at once removed and an immense amount of labour saved. The system of accounting as between the public, the paymaster, and the commissariat, would thus be placed upon a footing so simple and satisfactory that there could never at any time or under any circumstances be the slightest difficulty in settling a soldier's accounts; and so far as regards any period during which he is considered to have been on field service, the daily stoppage being always the same, the balance of pay would never vary, and it would only be necessary to establish the number of days he was entitled to receive it to admit of his accounts being at once settled.

"To arrive at this desirable result, however, it is necessary that the ration in the field should be of a fixed quantity and of a determinate value."

Q. 3096.

These observations of the Commissioners, with which we beg to express our entire concurrence, are meant to apply solely to a state of war; but all the statements as regards the complexity of the accounts and the waste of labour applies far more to peace than to war, when the system, becoming simply impracticable, is abandoned. Nothing, however, is or can be then substituted which shall act as an efficient guarantee against loss either to the soldier or to the public. In the late war an arbitrary settlement was made, and justifiably made under the circumstances, on terms purposely liberal, with a view to prevent all possibility of cavil or discontent among the men, an object which we believe was generally, though, of course, not universally obtained, but which, at any rate, was obtained by a general over-payment.

Q. 3099.
3713.
Q. 4857-8.

It appears to us that it is in war, when the public expenditure necessarily becomes unlimited in extent and lavish in character, that the existence of an adequate financial check is most necessary, provided the check be simple and easily worked. That course should be habitually adopted in peace which will best satisfy the requirements of a careful administration of the public finances, and be the most applicable to a state of war, whenever war may break out. An army is maintained in peace with a view to the contingency of war, and it should be so organized as to be capable of expansion with the least possible change of method and system on the part of those who administer

it. The mass of mankind do nothing well which they have not done long; and every change unnecessarily made at the commencement of war, when such disturbing influences are unavoidable, is the addition of unnecessary error and confusion.

It appears to us, therefore, that all the arguments for a fixed stoppage and full ration in time of war apply also to a time of peace. In both cases it is the duty and interest of the government to see that the soldier is provided with such a ration as will keep him in health and efficiency. In both cases it is advantageous to get rid of a cumbrous and costly system of accounts, by which time and labour are unnecessarily consumed in peace, and which has to be abandoned in war, when the expenditure requires the greatest vigilance.

Sir Alexander Tulloch expressed an apprehension that a full ration for three meals could not be issued by the commissariat at home without a considerable increase to the staff of that department; a reference, however, to the evidence of Commissary-General Adams will show that a very small addition, and that in the lowest class, namely, the issuers, would be required to carry the arrangement into effect, and the cost of that addition would be more than counterbalanced by the saving which would result from the simplification of the regimental accounts. The Accountant-General of the Army, who expressed an opinion very favourable to the proposed change, states that the diminution of labour consequent upon it will not be confined to the regimental accounts, but will be sensibly felt in the examination and audit in the War Office.

Among other advantages stated in evidence as likely to accrue if this plan be adopted, is the doing away with the temptation to small peculation on the part of the non-commissioned officers charged by the companies with providing the materials for messing.

We examined the Quartermaster General, and two other general officers who have had great experience in the internal economy of our regimental system, and all approved of the plan, though one of the latter expressed doubts as to the popularity of the change among the men. We satisfied ourselves, however, in this particular by examining several intelligent non-commissioned officers belonging to the guards, the artillery, the cavalry, and the infantry of the line, who were unanimous in its favour, though not concealing the probability that, like all changes, it would at the outset be received with some suspicion by the soldiers.

We propose, therefore, that in lieu of the commissariat stoppages of $4\frac{1}{2}d.$ at home and $3\frac{1}{2}d.$ abroad for the bread and meat rations, and of the maximum stoppage of $3\frac{1}{2}d.$ for messing (exclusive of the stoppage for washing), one uniform rate at home and abroad be stopped for the entire ration, the government supplying the whole through the commissariat, including tea, coffee, milk, vegetables, with occasional flour and raisins for puddings, and the extra bread required to make up the three meals.

In the Appendix will be found the rations said to be issued in the French, Turkish, and Russian armies; also two rations proposed for the use of the English army in peace, one by Commissary-General Adams, and the other by Sir Alexander Tulloch.

We are of opinion that no ration can be fixed upon which shall be adhered to both in peace and war. The conditions of life are so different in the two cases that whatever is suitable for the one must be either too much or too little for the other.

We have already described the listless and inactive life of the private soldier during peace. We extract from the report of the commission of inquiry into the supplies of the army of the East the following description of the soldier's life and duties in war:—

“The average weight carried by a soldier on the march, including food and water for the day, is probably not less than from fifty to sixty pounds, and while carrying that burden he is frequently required not only to march considerable distances, but also to move rapidly, and make other great exertions. In the ordinary course of his duty he is called upon to watch during the night, at longer or shorter intervals, whatever may have been his previous exertions. He is exposed to every vicissitude of temperature, and often to the inclemency of the weather by night as well as by day, and must be ready to turn out when required, at any hour, and under all circumstances. He must generally be content with the shelter of a tent, whatever the climate may be. When engaged in siege operations, he has to perform, mostly during the night, the work that a railway labourer performs by day—excavating and removing earth. When stores are to be landed, he is often required to do the work of a dockyard labourer. When employed on active service, the soldier, therefore, requires a diet as nutritious as that which is requisite to sustain the physical powers of any other man engaged in hard work, involving frequent watching and exposure.”

It is obvious that the most nutritive diet which can be provided is required to repair the waste created by such exertions, under such circumstances, and Dr. Christison considered that even what is generally known as the Crimean ration, and which included 16 oz. of fresh meat, fell short in its nutritive qualities of what was advisable under the circumstances. We have included in our Appendix Dr. Christison's letter on this subject, as clearly laying down the principles on which not only the total nutritive

xxxiii.

value of the ration, but the comparative amounts of the different kinds of nutriment of which it should be composed, ought to be fixed. But we extract the following passage, which was quoted in his evidence by Sir John McNeill:—

Q. 9850.

After stating the proportions of food which are necessary to the health and sustenance of a man, Dr. Christison says, "If the above proportion between the two sets be maintained, the weight of real nutriment per day varies, for adults at an active age, between 17 and 36 ounces; the former being enough for prisoners confined for short terms, the latter being required for keeping up the athletic constitution, or that which is capable of great continuous muscular efforts, as in prize running, and other similar feats. Dietaries ought never to be estimated by the rough weight of their constituents, without distinct reference to the real nutriment in these, as determined by physiological and chemical inquiry. Keeping these principles in view, and with the help of a simple table, it is not difficult to fix the dietary advisable for any body of men, according to their occupation. It is also in general easy to detect the source of error in unsuccessful dietaries. For example, any scientific person, conversant with the present subject, could have foretold, as a certain consequence, sooner or later, of their dietary, that the British troops would fall into the calamitous state of health which befel them last winter in the Crimea. Soldiers in the field will be more efficient the nearer they are brought to the athletic constitution. But as the demand for protracted unusual exertion occurs only at intervals, the highly nutritive athletic dietary is not absolutely necessary. On the whole, from experience in the case of other bodies of men somewhat similarly circumstanced, 28 ounces of real nutriment, of which seven are nitrogenous or reparative, will probably prove the most suitable. Any material reduction below 28 ounces will certainly not answer; and under usual exertion, kept up for days continuously, as in forced marches, or forced siege labour, the quantity should, for the time, be greater if possible."

We leave the exact amount and cost of the ration to be decided upon by those who have means at their disposal, which we have not, for ascertaining what are the variations which the climate of the various possessions of the Crown, garrisoned by British troops, require, and which the products of those countries will enable the Government to supply; keeping in mind always that an equivalent in nutritive qualities, both carboniferous and nitrogenous, for the standard ration fixed for home service, must be preserved.

Q. 2050.

The result then of the change which we propose will be, that the soldier will receive, whether at home or abroad, in peace or in war, on board ship or in hospital, a uniform net pay and a uniform ration, sufficient both in quantity and quality to provide him with three meals, and to keep him in health and efficiency. The only occasion on which the soldier would lose by this arrangement is when he is in hospital while serving with an army in the field; but as, by a change lately made he is then to be found in everything, including hospital clothing and necessaries, instead of providing himself, as he has hitherto been expected to do, from his kit, and as increased comforts will be afforded him while in hospital, the arrangement will not be inequitable for him; and some mischief will be obviated by preventing the accumulation of so much balance to be paid to the convalescent when dismissed from hospital, which is not unfrequently the cause of his return thither. Whether one exception should be made in peace by the continuance of the present hospital stoppage of 10*d.* at home and 9*d.* abroad, is a question which falls more properly under the consideration of the military authorities. The increased stoppage does not cover the whole expense of the man's treatment in hospital. It is supposed to act as a check on malingering, and there is no injustice in giving a man less pay when his work is not done, especially when he is subsisted and provided with every means of cure. It has been alleged that the rate falls heavily on the married soldier by trenching on the balance with which he supports his family, and one witness recommended that the married man should be exceptionally treated in this respect, a proposal to which the objections are many and obvious, the amount of pay to the soldier being apportioned to the value of his service, and that service being the same whether the soldier be married or single. The opinion of Mr. Kirby, the chief examiner of accounts at the War Office, which is strongly in favour of the proposed single and uniform stoppage, as greatly diminishing the labour both of account and audit, is on the same principle opposed to any additional stoppage in hospital. The chief advantages, however, which are to be derived from an uniform stoppage would still be secured, even though an exceptional stoppage were preserved for men in hospital during peace; and in war no addition to the fixed rate of stoppage would be exacted from men in hospital, and the uniformity and consequent simplicity of account would then be complete.

Q. 3952.

Whether in lieu of the nominal rate of pay and stoppage, being lower by 1*d.* abroad than at home, the rates should be equalized by adding 1*d.* for beer money to the pay abroad, and making the same addition to the stoppage, is immaterial except as a matter of account, the net balance remaining in the hands of the soldier being the same in either

case, and we offer no opinion on the subject; but it is important that the rate of stoppage should not, in very cheap colonies, appear to be larger than the actual cost of the articles supplied. Q. 7225.

It was suggested to us by General Lawrence, that the regimental contracts for shirts, socks, and other necessities, which are sold at contract prices to the men, should also be transferred to the commissariat, as their supply necessarily devolves on the commissariat in war, when the regiment has no means of procuring or carrying with them stores of such articles. An instance was quoted to us by General Lawrence of a heavy loss incurred by a battalion of the Rifles, who took out their store of necessities, but were unable to carry them further than Constantinople, whence they never recovered them. In the meanwhile necessities were issued to the troops as army stores, it being found impossible for the regiments to procure them otherwise; and it appears to us that many of the reasons which we have adduced in favour of the issue of the consolidated ration by the commissariat are applicable likewise to the contracts for necessities. Q. 3993. Q. 3994. Q. 3995-7.

Cooking.

It must be remembered that the men will never secure the whole advantage to be derived from the supply of the materials of a sufficient ration unless proper and sufficient means of cooking it are provided.

At present, in barrack as in hospital, but one mode of dressing food is recognized or provided. Coppers for boiling exist in every barrack, but no meat can be baked, roasted, stewed, or fried.

When a soldier, therefore, enters the service, he has the prospect of dining on boiled meat every day for 21 years, if he is enabled to serve so long. There can be no doubt that some variety, not only in the material but in the preparation of food, is necessary to ensure its being palatable; and we have it stated in evidence that men frequently leave part of their meat, which, when cooked and free from bone, does not much exceed half a pound, their stomach loathing the constant repetition of the same food in the same form. Q. 3060. Q. 4962-4. Q. 2931-4. Q. 3062. Q. 3894.

The experience of Dr. Balfour at Chelsea shows that a variety in the mode of cooking the food consumed has produced a higher standard of health among the boys in the Royal Military Asylum, with a positive diminution in expense. That the men themselves attach much importance to obtaining this variety is proved by the fact that they send out their meat on certain days in the week, at their own expense, to bakers in the towns where they are quartered, in order to have it cooked differently from what can be done in the barrack kitchens. Q. 9531-2. Q. 4692. Q. 5839. Q. 4847. Q. 4422. Q. 5047-9.

Clothing.

We examined not only medical, but general and other officers, as well as non-commissioned officers, with respect to the articles of clothing now issued to the men. Of late years great improvement has been made in the clothing of the troops. The form of the tunic now adopted affords protection to the hips and belly of the wearer which the coatee did not. The material is stated to be better than that formerly in use, and the fashion of tight clothing is for the present at least discarded. Too much importance cannot be attached to an easy adjustment of the clothing, so as to leave to the respiratory and other organs of the body, as well as to its muscular development, the utmost freedom. Great benefit is stated to have resulted from the use of the canvas frock at the Cape and in the Crimea, in lieu of the cloth tunic. As regards under-clothing, the balance of evidence, both of commanding and medical officers, is in favour of the flannel shirt. But the opinion of the non-commissioned officers examined was decidedly unfavourable to it, principally on the ground of the increased cost of the article, which is one of the necessities kept up at the expense of the soldier. Q. 3273. Q. 4762-4771. Q. 3248. Q. 2779. Q. 3271. Q. 2944. Q. 4147. Q. 4629-40. Q. 5953-8. Q. 4859-61. Q. 4968-77. Q. 5075-8. Q. 4785. Q. 3247. Q. 4121-2. Q. 5943-8.

The quality of the boots is complained of, and it has been suggested that a boot should be adopted, capable of being laced over the trowser, as the French gaiter is buttoned on the march, so as to prevent the accumulation of wet and mud on the loose trowser round the ankle.

The stiff stock is condemned by almost every one who has given his opinion upon it. The men, indeed, consider that it looks smart, and some of them wish to keep it, on the understanding, however, that it may be always taken off when muscular exertion is required. This condition applied to any part of a soldier's dress appears to us to be condemnatory of it. The degree to which men suffer from the use of the stiff stock on parade and other duties is no doubt prejudicial to health; on a march they are always allowed to take it off. The complaint made of the horse-hair stocks which were substituted for the stiff leather stocks is that they coil up till they become shapeless, and rise above the collar of the coat. Q. 2774. Q. 2944-52. Q. 4733-46. Q. 4866-72. Q. 4991-6. Q. 3262-8. Q. 3266-7. Q. 4145.

We do not underrate the value of a smart and soldierlike appearance, to which the men themselves attach much importance; Serjeant Russell, of the Grenadier Guards, produced before us a light leather stock which he himself and many of his comrades wear; it is manufactured by Corporal Macdonald of the Second Life Guards, and is so constructed that, while light and flexible to the wearer, it cannot rise above the collar or be displaced from its proper position. This stock appears worthy of trial.

But the most difficult problem to solve in army costume is the head-dress. Formerly it was a *sine quâ non* that the head-dress should protect the head of the wearer from a sabre cut. It was looked upon as armour still used for the protection of the head. We doubt the value of this protection, if it be purchased at the expense of a degree of weight and of heat likely to prove injurious to far more men than it will ever preserve from sabre wounds. The altered system of warfare, from the daily increasing range of the weapons used, renders the attempted protection of particular parts of the body more than ever useless; and it becomes the more important to consider what character of head-gear will afford the best protection to the head, not from sabre or bullet, but from heat, cold, and wet, and can be worn most conveniently by the soldier on the march or when sleeping at the bivouac.

Much complaint has been made by witnesses of the form of the peak of the forage-cap (now no longer worn), but which had none of the advantages of a peak, as it either afforded no protection to the eyes, or, by coming down close upon them, created so heated an atmosphere as sensibly to incommode them.

This applies, though in a less degree, to the shako now in use.

The busby is stated, from its form or want of form, to press in a narrow circle on the man's forehead to a degree very painful to the wearer. There is no reason why the interior of the busby should not be adapted to the form of the human head, though the exterior should still preserve its rectilinear shape.

We are satisfied that the shako is, from its colour, weight, material, and form, altogether inapplicable to tropical climates such as those in which some of our troops pass a great portion of their lives. For them there is no head-dress giving so efficient a protection to the head, face, and neck as a light cap covered by wadded linen, with a flap hanging down behind, or else a few yards of linen rolled, turban-fashion, round the forage cap; and we recommend the adoption of some such head-dress in India and all climates of similar temperature.

We may add that the practice in the French and Russian armies is to discard the shako altogether on field service, and to substitute the forage-cap.

The great coat worn in the British army is of very bad material, of little use against cold, while it readily imbibes and retains wet.

The manner of slinging the knapsack invented by Mr. Berrington appears to possess great advantages. The knapsack can be put on and taken off by the wearer without assistance. It sits easily on the back, and the straps are so placed as to relieve the arms and chest from that pressure which now causes the men much annoyance. Colonel Lindsay, of the Guards, describes it as the best knapsack he ever saw put on a soldier's back, the man wearing it being unfettered in his arms, which are free from the numbness caused by the regulation slings.

We understand that there is an excess of price in Mr. Berrington's slings compared with those now in use; but we do not know how far, on a large contract, that excess might be reduced. We, however, strongly recommend a thorough trial of his method, by issuing in some regiments, say to one half the battalion, the Berrington knapsack, to be tried against the regulation knapsack worn by the other half.

Effect of Sanitary Measures.

We have devoted much time to the consideration of these five topics of barracks, encampments, food, clothing, and duty, because they include the principal conditions of the life of the soldier, and upon their sufficiency his habitual health must depend; and as it is to defects in all or some of them that we must look for the causes of the extraordinary mortality which habitually ravages the British army, so it is to their removal that we must look for the diminution of that mortality.

It ought not to be possible to say, as was said by a witness whom we examined, that a soldier never knows a healthy home, as regards air and space, till he commits some crime which brings him into the thoroughly ventilated cell of a military prison; or as another witness stated,—

"That a soldier's barrack room at present has not the least pretension to the comforts of an ordinary dwelling-house, and, what is infinitely more disgraceful, there is not even the attempt made to introduce into it the decencies of civilized life."

Sir John McNeill's evidence shows that the paupers under his charge are better lodged Q. 9838.
than our soldiers.

The Duke of York's School at Chelsea was, in its conditions of life, and making a due Q. 9529.
allowance for the difference of age in its inmates, an epitome of a soldier's barrack. The
same monotonous boiling of the ration, and the same over-crowding and non-ventilation
of the dormitory, produced a rate of mortality among the boys of 9·7 per 1,000 on
the average of ten years. By the improvement of the diet (not by an augmentation
of the ration, but by variety in the mode of preparing it), by a careful ventilation of the
dormitories, and a better adjustment of the space per bed, Dr. Balfour succeeded in
effecting so great an improvement in the health of these children, that the mortality on
the average of 8½ years since the changes were made has amounted only to 4·8 per 1,000,
while the number reported unfit for military service, chiefly from the effects of strumous Q. 9536.
disease, has been reduced from an average of 12·4 to an average of 4·6 per 1,000.

Similar results have attended the establishment of model lodging houses when con- Q. 9490.
structed with a due regard to sanitary precautions. These houses have no cesspools, they
have all trapped water-closets, properly drained, and plenty of water; they are free from
nuisances, and have adequate means of ventilation. Some of those occupied by families
are of large dimensions, and accommodate from 300 to 600 or 700 persons of all ages.
Dr. Southwood Smith, in his lectures on epidemics published last year, has given the
mortality in these houses for a period of from three to five years, from which it appears
that the proportion of deaths to 1,000 living was from 12·6 to 13·9 per annum, being a
little above one-half the rate of the mortality of the metropolis. The last report of the
Metropolitan Association shows that the rate of mortality in their houses during the
three years ending June 5th, 1857, bore nearly the same proportion.

If it be argued that these results are shown only in buildings which, like the model
lodging-houses, have been constructed expressly with a view to health, it may be answered
that barracks also should be built expressly with a view to health.

But the common lodging-houses have certainly not been built with any higher object
than the accommodation of the largest number of rent-paying inhabitants. These lodging-
houses were placed under inspection by Lord Shaftesbury's Act.

Mr. Assistant Commissioner Harris, of the metropolitan police, in a report to Sir Q. 9485.
George Grey, just published, describes the common lodging-houses, before the passing of
this Act, as—

“Crowded and filthy, without water or ventilation, without the least regard to cleanliness or
decency, and hot beds of disease, misery, and crime.” “Under the operation of the police inspection
the evils attending such houses have been in a great degree removed or abated.” “The accommoda-
tion given in the registered houses consists of clean beds and bedding, well-ventilated and lime-
washed sleeping rooms, well-cleaned kitchens, plenty of water for all purposes, and good water-
closets and sinks, drained and trapped to the common sewer, wherever such is available.”

“From September 1851 to 1st of January 1857, the number of lodgers allowed to registered
houses in the metropolis has been 91,106. The officers of health and district medical officers are
unanimous in their opinion as to the great diminution of sickness from the strict sanitary precautions
exercised in these houses, notwithstanding zymotic diseases still prevail amongst the poor in their
immediate neighbourhood. Similar testimony has been borne to the very beneficial operations of the
Common Lodging-houses Act all over the country, and the experience obtained at Macclesfield is
an illustration of the good which has been accomplished in the provinces. Referring to the common
lodging-houses, the town clerk says, All these pest houses have given place to clean and well-
ventilated apartments. Out of 115,000 lodgments in these improved houses during the year, there
were only nine cases of sickness and four deaths. No fever or other epidemic diseases have visited a
single lodging-house.”

Again, as regards cholera, Dr. Sutherland states that there were,—

Q. 9486.

“In the common lodging-houses under inspection 61 deaths from cholera among 82,000 inmates,
being about one-sixth of the rate of cholera mortality proportionably over the whole metropolis in
1854.”

He quotes another remarkable instance of improvement:

“In Lambeth-square, Lambeth, which consists of 35 well-built houses, they had open privies,
opening into badly constructed drains, which passed under the houses, exemplifying on a small scale
the drainage defects of Scutari. In 1849 six of the inhabitants of these houses died of cholera.
They suffered much from epidemic disease, and the mortality was always high. In 1851–2 there
were 80 attacks of typhus, scarlet fever, and small-pox, and 24 deaths among a population of 434.
In 20 years 1,250*l.* had been spent unintelligently in endeavouring to remedy the evils. The first
Board of Health recommended the removal of the existing drainage, and the substitution of pipe
drains and water-closets, which cost less than 200*l.* for the whole square. The mortality has since
fallen about one-half, the deaths from zymotic diseases have fallen to one-seventh, and there was not
a single death from cholera in 1854.”

Speaking again of some of the metropolitan model lodging-houses, Dr. Sutherland says,—
 “During the cholera of 1854, all of these houses escaped the epidemic, while it existed in the districts where they were situated, except in one family, consisting of ten persons, living in one of the Albert-street dwellings, in the basement, with about 276 cubic feet of space for each inmate, and this over-crowding led to four deaths among them from cholera.”

It must be recollected that these improvements were not effected without much delay and difficulty, that it required the powers of an Act of Parliament to give to the authorities access to these common lodging-houses, and that the changes made were not unfrequently resisted by the owners of the houses dealt with, and by the inhabitants, who were of the lowest and least respectable class of the population.

But no such difficulty presents itself in the case of the barracks, which are the property of the Crown, and the inhabitants of which are men often drawn from some of the best portions of the labouring classes, who are serving Your Majesty, and for whose health and well-being the Government are responsible.

App. B. to Rep.
of Board of
Health on the
Epid. Cholera,
laid before Par-
liament, 1850.

The results of overcrowding, of non-ventilation, and of defective sewerage in the barracks are clearly apparent from a table showing the deaths from cholera among the Horse and Foot Guards in 1849, supplied by the Adjutant-General, and printed in Mr. Grainger's report on epidemic cholera, from which it appears that the troops in London, with one exception, suffered in a much larger proportion from cholera than the civil population of the parishes in which the barracks are situated.

The following table, showing the deaths per 1,000 among troops and civilians in the same parishes, is taken from the Adjutant-General's return and those of the Registrar-General, and it must be recollected that the deaths of the civilians are taken on the whole population, without distinction of age or sex:—

				Wood and Portman barracks	-	-	

No doubt to the same causes may be partly attributed the mortality from fever in barracks, which is in ordinary years much in excess of that of the civil population.

Dr. Sutherland, being asked, “Is there any reason in your estimation why barracks could not be rendered as healthy as buildings of the classes you have described?” answered,—

“None whatever; I have heard all the reasons usually assigned for the extravagantly high mortality existing in the army, and I can see no reason whatever why, if sanitary measures were applied with due intelligence to barracks, most of the excessive mortality in the army might not be swept away.”

And these measures fortunately can be applied by order and at once, without rate-payers to be consulted or Acts of Parliament to be obtained.

The table at p. xii. of this report, and the diagrams supplied by Sir A. Tulloch in No. lxii. of Appendix, show how much the mortality of the white troops has been diminished, between 1837 and the present period, in the West Indies and in Jamaica, though it still remains very high on both stations. During 19 years, from 1817 to 1836, the average annual mortality of the white troops in the West Indies was 81.3 per 1,000, but during the 16 years from 1837 to 1853 it fell to 62.5 per 1,000. In Jamaica during the same periods it has fallen from 128 in the first period to 60 per 1,000 in the second, and since 1841, in which year the white troops were moved up to Newcastle, in the Blue Mountains, the average mortality has fallen as low as 36 per 1,000.

This reduction has been effected by precautions against epidemic disease, but more especially against yellow fever, and is attributable chiefly to the change of site, whether of barrack or hospital, to high localities, to the enlarged space in barracks, to increased cleanliness, to the moving or camping out of troops in all cases of epidemics, to improved diet, and the reduction of the use of salt provisions from four and five to one and two days in the week, to the greater facilities for the immediate sending home of invalids, and to the system of rotation of service applied to our reliefs, by which, except in India, no regiment remains more than three years, instead of ten or twelve years, as formerly, at unhealthy stations.

* The Wellington barracks are in St. James's Park, the most open and healthiest spot in the district.

But the strongest example of what well-directed care and precaution can effect is to be found in the comparative health at different periods of the army in the Crimea. The example is of singular value, inasmuch as it offers to our view the most complete case on record, on the largest scale, of neglects committed, of consequences incurred, of remedies applied, and of consequent improvements in health and efficiency. Without entering into any of the controversies now we trust at an end, as to what was or what was not avoidable in a winter campaign with an army unacclimated to war during a siege unexampled in its character, the facts remain, and it is our duty not to neglect the lessons that may be drawn from them.

Throughout the winter of 1854-5 the troops were suffering from work altogether disproportioned to their strength, from broken rest, insufficient clothing and shelter, unwholesome food, and want of cleanliness. As the spring advanced, to these causes of disease and mortality were added others, arising from want of drainage and ventilation, and the nuisances resulting from the lengthened occupation of the same ground without sufficient countervailing precautions. Throughout the period of seven months, from October 1, 1854, to April 30, 1855, the rate of mortality rose as high as 600 per 1,000 per annum. But in November and December of 1855, with supplies abundant, food of a wholesome character, and improving sanitary conditions, the rate of mortality per 1,000 per annum had already fallen to 44 and 33; and with huts well drained and ventilated, nuisances removed, and the camps thoroughly cleansed, from January to May, 1856, the rate of mortality of the army in the Crimea per 1,000 per annum fell to 12½ and in May to 8, as against 17·8 in the infantry at home. Diagrams H. I. and K. Appendix No. lxxii., illustrate the variations in the rates of mortality in the army in the East during the Russian war.

See Medical Returns, quoted in Sir A. Tulloch's Pamph., strength, 28,939; deaths in 7 months, 10,053.

With regard to the hospitals at Scutari and Kulalee, the evidence shows that their unexampled mortality arose from other causes beside the severe type of disease. The drains of the hospitals were nothing better than cesspools, through which the wind blew sewer air into the corridors and wards. There was no ventilation; there had been little or no lime-washing; the ward utensils infected the atmosphere; the hospitals were overcrowded; there was an overcharged graveyard close to the general hospital; the number of sick admitted went on increasing; no sanitary improvements were effected, and the mortality rose progressively month by month, as follows,—

Q. 9479.
Q. 10,007.

There died 155 per 1,000 treated, from November 12 to December 9.

Q. 10,004.

179	“	“	December 10 to January 6.
321	“	“	January 7 to January 31.
427	“	“	February 1 to February 28.

During the month of February, although the mortality rose so considerably, the number of sick in hospital as well as the admissions had fallen off, and the deaths on board the transports were only one sixth part in February of what they were in January, showing, that though the army was becoming more healthy, the hospitals were becoming more unhealthy the longer they were used.

About the middle of March the sanitary improvements in the hospitals were commenced. During the three weeks preceding the 17th the deaths were 315 per 1,000 treated, and in the following five periods of three weeks each the progressive fall was as follows:—

Q. 10,004.

There died 144 per 1,000 treated from 18 March to April 8.

107	“	“	9 April to April 29.
52	“	“	29 April to May 20.
48	“	“	20 May to June 10.
22	“	“	10 June to June 30.

These facts will be found clearly illustrated by Diagram K., No. lxxii. of the Appendix.

It appears to us that, could the same care be bestowed upon the troops at home which was bestowed at the period we have mentioned on the army in camp and in the field, a great reduction in their rates of mortality would assuredly be effected.

We look to the practical adoption of similar precautions, as regards the troops in barracks, as among the means by which the excessive mortality of the army may be diminished. Other causes, no doubt, exercise an unfavourable influence on the health of the men, and those have not been overlooked in the practical recommendations which we now make.

We recommend that in future a minimum cubic space of not less than 600 feet be allotted to each man in his barrack-room and in the guard-room, and that an interval of at least three feet be allowed between each bed in the former.

That urine tubs be on no account tolerated in the barrack-rooms; but that urinals, with a water supply outside the barrack-room, or common chamber utensils, be substituted.

We recommend that every barrack should contain ablution rooms and baths, laundry and drying-room, and workshops; and also, that suitable provision be made for non-commissioned officers' and married soldiers' quarters.

That day-rooms be constructed for the use of the men in some of the principal barracks at home, and, if found advantageous, that they be extended to all barracks.

We further recommend that all barrack-rooms, guard-rooms, and day-rooms be sufficiently warmed and lighted, whatever may be the number of men occupying them; and that gas be used for lighting whenever it is obtainable.

That, with a view to enable the soldier to have variety in his meals, the means of baking, frying, &c., be provided in the kitchens of all barracks and hospitals.

That, with a view to the thorough ventilation of barracks, the diminution of overcrowding, the abolition of cesspools, and the formation of proper drainage and sewerage, and an abundant water supply, we recommend the appointment of a commission consisting of an engineer officer, and a medical officer versed in the practical application of sanitary science, who together with the medical officer and the barrack master of the inspected barrack shall systematically undertake the inspection of every barrack, and devise and execute the necessary works with such expedition as the available resources of the Government may permit, until every barrack in use shall in its turn be brought to a healthy and satisfactory condition; and that in the meanwhile, immediate orders be given to the barrack department to revise the allotment of men to rooms, so as to divide the cubic space more equally, and when the barracks are not full, to occupy additional rooms, thereby reducing the numbers in each, and thus, as soon as possible, secure to each soldier at least the minimum space recommended by us.

We recommend that in future, before a barrack is built, the advice and opinion of competent medical officers be taken as regards both the site and plan.

We recommend that inquiry should be made into the French system of gymnastic exercises, with a view to the adoption of some similar practice in the British army.

We recommend that facilities and encouragement be given for all athletic games, such as fives, cricket, quoits, single-stick, and for gymnastic exercises, &c., and that the men be employed on different kinds of labour when possible.

We recommend that, in order to secure that sanitary considerations shall not be overlooked in the choice of sites for encampments, hospitals, barracks, or in any matter involving the health of the troops, such as water supply, drainage, food, clothing, &c., medical officers be invariably consulted; and in order to fix on commanding officers and on medical officers the responsibility properly belonging to each, that the medical officer shall be required to give his advice in writing, the commanding officer to affix in writing his reasons for rejecting it, if he think fit to do so, and to transmit the document to superior authority.

We recommend that, in order to secure to the commanding officer of an army in the field the most efficient sanitary advice, and to relieve the principal medical officer of duties which his other avocations leave him no time to perform, a sanitary officer be appointed to act under the authority of the principal medical officer, but to be attached to the staff of the quartermaster-general.

We recommend the consolidation of the present stoppages for ration and regimental messing, and, in consideration of that consolidated stoppage, the issue to the soldier by the commissariat of a sufficient amount of food for three daily meals, including vegetables, tea, coffee, and sugar, with such variations abroad as the climate or the markets may render necessary.

We recommend that the soldiers' necessaries, hitherto obtained by regimental contract, should be provided by the commissariat.

We recommend the adoption of a better boot; also a lighter stock of the pattern specified; a more horizontal peak to the forage cap, and the substitution of a light cap, with a wadded linen cover or a roll of linen, for the shako in hot climates. Also that greater attention be paid to the interior form of the head-dress, whether shako or busby; that the great coat be of a better quality and more durable texture; that all clothing be made sufficiently loose to permit the free use of the limbs and unimpeded action of the muscles; and that the material of the clothing be adapted to the various climates in which the troops may be serving.

Lastly, we strongly recommend the immediate testing, by its issue to half a battalion, of the "Berrington" knapsack sling.

Hospitals.

Before discussing the changes which we think requisite in the organization of army hospitals it is desirable to give a short account of the existing hospitals and the system on which they are managed.

The army general hospitals in Great Britain and Ireland are three in number, and are situated at Chatham, Dublin, and Cork; but the latter is on a most limited scale. There are none in the colonies nor in India, except the Company's general hospital existing at each of the three presidencies, and such temporary general hospitals as may be formed with armies in the field.

Besides these, there are others equalling the general hospitals in extent, such as the hospitals at Dublin, Woolwich, Portsmouth, Plymouth, Aldershot, and Shorncliff; these, however, are not general hospitals, but merely congeries of several regimental hospitals, each remaining as completely distinct, in point of medical and other attendance and supervision, as though placed in the separate barracks in which their respective regiments are quartered.

Members of the Commission minutely inspected the military hospitals at two principal stations, Chatham and Portsmouth, which it is presumed may fairly be taken as specimens of the whole.

At Chatham there are four hospitals, namely, the Invalid hospital at Fort Pitt, the Garrison hospital at Brompton, the Spur Battery hospital, and a small Lunatic hospital at Fort Pitt.

Q. 2019.

The following is the description of the Fort Pitt hospital given in his evidence before the Commission by the principal medical officer in charge. The wards in the hospital at Fort Pitt are not spacious enough for the number of patients apportioned to them. The beds are 22 inches apart, being themselves 31 inches wide, and 6 feet long. They are ranged opposite to one another along the walls, and the space between them from foot to foot measures 9 feet. The number of beds in each ward is 27. In the lower room the cubic space to each bed is 690 feet, the height of the room being 13 ft. 10 in.; the upper ward is 12 ft. 10 in. high, and the cubic contents only 640 ft. per bed. The number of patients to be accommodated in each ward is painted outside on the door, and was originally fixed by the barrack department; but when there are few patients in the hospital the medical officer, at his discretion, scatters them through the wards so as to secure to each man a greater space.

Q. 2023-4.

Q. 2028-30.

The principal medical officer states, that when the wards are full the allowance of space is very small, smaller in fact than that laid down in the hospital regulations, which give 600 feet as the minimum in temperate climates. The wards are not well ventilated, being remarkably foul in the morning. The walls are white-washed every year, but the hospital is painted only at certain stated intervals, which apparently are not sufficiently frequent, as the woodwork from being denuded of paint has a very dirty and uncomfortable appearance; though, in the opinion of the witness, painting the hospital is necessary for the health of the patients, and a bad moral effect is produced upon them by its dirty and neglected appearance. The waterclosets are badly contrived and not in good order. The privies outside are very offensive, and are close to one of the wards and to the kitchen, where great annoyance is experienced from the smell.

Q. 2160.

Q. 2033.

Q. 2096.

Q. 2101-3.

Q. 2089.

Q. 1352-3.

The purveyor states, that,—

“Immediately outside Fort Pitt gate there is a shaft to carry off the horrible smell from the privies, when the men inhabited the casemates, but it is much to the annoyance of the people who go past. It ventilates a series of dark privies below; and I can assure the Commissioners that I have been down there, and I have almost fainted from the horrible smell. It has drawn tears from my eyes, worse than any hartshorn bottle that I ever put to my nose. This was for the relief of the people in the casemates, but to the detriment of the public. When the wind is in a particular direction I can smell it for a quarter of a mile. I have smelt it on parade.”

Q. 1375.

Q. 1377.

At Brompton hospital, the waterclosets are kept closed during the day, according to a witness before the Commissioners, in order to prevent their indiscriminate use by the patients, who would from carelessness or wantonness put them out of order, but, as explained verbally on the spot, because too frequent use makes them very offensive. The wards in this hospital are faulty in construction, consisting of long narrow rooms placed side by side, having windows at one end, and opening by a door on a corridor at the other. They have therefore no means of thorough ventilation, and are dependent on what can be supplied artificially. The wards are scarcely provided at all with cupboards, and the clothing and effects of the men, including blacking brushes, are placed under each bed with the chamber-pot, which is of pewter, and inferior for its purpose to crockery, creating more smell and impurity. In one building there are stone staircases for safety in case of fire; but the landings and lobbies being of wood, all egress might be cut off. In the other buildings the staircases are entirely of wood.

Q. 2036.

Q. 2123-6.

Q. 2131.

Q. 2115-16.

The supply of utensils to the hospital rests with the Barrack Department. Each man is supplied with a plate, an earthenware bowl, and a tin mug. No cup, saucer, or earthenware mug is issued. The men refuse to drink out of the tin mugs, which are soon corroded and present a dirty unpleasant appearance; nor is it possible to drink any hot liquid from them, as they absorb and retain the heat, and become too hot to admit of contact with the lips. The men drink their tea and coffee from the bowl at breakfast, as also, at dinner, first their soup and then their beer; no glass is used for the men even when taking medicine.

The ablutions of the patients are performed in a lavatory, where a long trough contains basins into which water can be turned by cocks; for men who are too ill to leave their beds, a basin and towel are brought. One basin is allowed to each ward. The Barrack Department supply round towels for the lavatory, but they do not supply square ones as they possess none; those are bought by the purveyor.

The kitchens in these hospitals are very defective; that in Fort Pitt is extremely confined, and is occasionally very offensive from the proximity of the privies. There are no kitchen ranges, nor any means of roasting or baking, except in a small adjoining room which is used as a kitchen for extras, and where there are the means of baking about sixteen puddings at a time, and of frying mutton chops on a gridiron. The ordinary rations are therefore, as in barracks, habitually boiled in large coppers, and no change or variety in the preparation of their food can be effected for the sick. Upon this point we cannot forbear quoting the opinion given by Col. Haly, of the 47th regiment, before the Commission on the hospitals in the East. Col. Haly says,—

During the expedition to the East, both in Bulgaria and in the Crimea, to my own positive knowledge, many a soldier, when becoming sickly or after being in hospital, has broken down from the effect of mawkish and insipid food, badly cooked, which debility and want of appetite prevented his eating; and several soldiers so situated have, to my personal knowledge, been set up and in a great measure restored to health, in my own regiment, by the help of a little wholesome and palatable food from officers' tents."

Before a certain hour in the morning, when the extras for the day are prescribed and the provisions sent for, it is not possible to give chicken or beef tea for a patient requiring immediate support, the regulations not permitting any stock of meat to be kept in the hospital, nor more to be purchased than the exact amount prescribed for the day's use of the patients; the object of this regulation being to guard against the purloining of meat, that object is secured by there being no meat to purloin.

We have given these minute details at length as the best mode of describing the state of the Chatham hospitals, which, it must be recollected, are the chief hospitals of the British army, and which suffer, as it appears to us, not from casual deficiency in some one department, but from insufficient accommodation and supply pervading every branch of the establishment.

A reference to the description given of these very hospitals in the year 1843, by Dr. Andrew Smith, then Principal Medical Officer at Chatham, will show that the account we have now given of them is by no means over-coloured; and it is worthy of observation, that the worst and most dangerous nuisances then complained of have not been removed to this day.

We have taken no evidence with regard to the Spur Battery hospital, nor did the Commissioners visit it, as it is not at present used for a hospital; but it is described by Dr. Andrew Smith, in the memorandum to which we have thought it due to him to draw attention, as "so inferior that he is ashamed to notice it."

The lunatic invalids at Chatham have hitherto been lodged in the casemates. Any place more unfit for the reception of lunatics, or indeed of sick of any description, cannot be conceived; but as a new building has recently been erected in Fort Pitt, to which they have been removed, we forbear giving any description of these casemates.

The new building has been inspected by the Commissioners in lunacy. They state that,—

"It is calculated to accommodate between forty and fifty patients with the proper officer or attendants. The rooms are of good size, but the means of ventilation are in our opinion insufficient. The windows do not open sufficiently, and the only means of ventilating the galleries is by opening the windows of the waterclosets, through which the air must pass, before reaching the interior."

Comparison with Naval Hospitals.

The appearance and accommodation of the Melville hospital at Chatham, where the sick from the marines are received, present a marked contrast with the army hospitals. In the words of the Principal Medical Officer of Fort Pitt, "there can be no comparison between the two." The building at Melville hospital is well adapted to its purpose. It

Q. 6625.

Q. 2164.

is well proportioned to the requirements of the men, and the number of patients is never excessive. There are three feet between each bed, and twelve feet from foot to foot. The cubic space allowed to each bed is 1,340 feet, the ventilation is excellent, and the wards being fresh painted, are admirably clean and very cheerful. There are separate lavatories and water-closets to each ward; the latter perfectly clean and sweet. The kitchens are very superior, and enable the men to have roast as well as boiled meat. All the washing, that is, the bedding as well as the personal linen, is done in their own laundry; in the army hospital the personal linen only is washed in the laundry, and the bedding is sent to the Barrack Department, which is a subject of complaint. The supply of furniture, crockery, glass, &c., is far more ample and of better quality than in the army hospitals. A certain proportion of female nurses are employed in the medical wards of the naval hospitals, and their presence is considered advantageous. See App. No. xxxi.

Two members of the Commission visited the hospital at Portsmouth, and a detailed account of it will be found in Dr. Sutherland's evidence, from which it will be sufficient to extract the following passage: Q. 389-92. Q. 6516

"This hospital has been constructed on a very defective plan, the wards are too long between the windows from back to front, the means of ventilation are wholly inadequate, the cubic space for each patient is about one half of what it should be, the hospital is not clean, and, as there are no female nurses, it is destitute of that neatness and order observed at Haslar. Its local position is not good, though perhaps as much so as could be obtained in the locality."

"It is situated across the opening of one of the bastions, with a high rampart rising at a short distance behind it."

"The ablution room is badly lighted, and there is no proper bath accommodation. This hospital affords in every respect a striking contrast in its sanitary condition to Haslar hospital, though there are some points in which the latter would admit of improvement."

Of Haslar, Dr. Sutherland says:

"The hospital was beautifully clean in every part, the floors well rubbed, the walls and ceilings brightly whitewashed, and the light abundant. The officers' quarters are carpeted and suitably furnished. The kitchens are in the basement of the building. They were in excellent condition, amply provided with boilers, and along one side was a large iron range for cooking by gas."

With respect to the internal supply and service of the hospitals, the comparison of the Melville hospital with the army hospitals at Chatham holds good as between Haslar and the army hospital at Portsmouth.

Comparison with Civil Hospitals.

With a view to establish an accurate comparison between the general character of the buildings used as civil hospitals and those used as army hospitals, we addressed to the proper authorities queries on the subject of the space and means of ventilation in 11 of the largest civil hospitals in London, in 20 provincial hospitals, in five naval and in 45 army hospitals. App. No. xxxix.

In all these hospitals the beds are generally about three feet wide; in one or two instances in the civil hospitals they are as much as four feet wide; in two of the provincial hospitals they do not exceed 2ft. 8½. and 2ft. 9., and in one army hospital they do not exceed 2ft. 2.

In the metropolitan hospitals the average cubic space allotted to each bed is 1,434 feet, the largest space being 2,426 feet, and the smallest in any ward 800 feet.

In the provincial hospitals the average is 1,081 feet, the largest space being 1,560 feet, and the smallest in any ward 600 feet.

In the five naval hospitals the average space per bed is 1,037 feet, the maximum being 1,340 feet, and the minimum 751 feet.

In the 45 army hospitals the average space per bed is 632 feet, the maximum in any ward being 1,143 feet, and the minimum 400 feet.

These measurements give an excess of space over the army hospitals to the metropolitan of 802 feet, to the provincial of 449 feet, and to the naval hospitals of 405 feet per bed. But in considering what space should be allotted to each patient, we must not be guided by cubic space alone, inasmuch as no loftiness in the ward can compensate for too close a juxtaposition of the patients. The importance of this consideration is best explained by the fact, that a man may be nearly suffocated in a crowd in the open air, notwithstanding the cubic space above him is immeasurable. Q. 3279.

A return, marked xxxix. (5) in the Appendix, gives the opinions of the governors, medical officers, superintendents, and stewards of several of the chief hospitals in London and the country, on the subject of ventilation and construction. The prevailing opinion as regards ventilation is in favour of what is now technically called natural as opposed to artificial ventilation; terms which have a conventional meaning, and may require explanation. By natural ventilation is meant the free ingress or egress of air through open

windows, aided by additional orifices placed in different parts of the room, through which the external air is allowed to enter, and the foul air to escape. Artificial ventilation is effected either by driving fresh air in, or by extracting foul air by means of suction, through the intervention of machinery, shafts, and furnaces.

Q. 1904. Of the whole number of answers given to the queries circulated by us, but three or four speak in favour of artificial ventilation. At Guy's Hospital both systems are in operation side by side, in the new and the old buildings, and the preference is given to natural ventilation.

Q. 6541. But in each case where the subject of construction is mentioned in connection with natural ventilation, long wards with a large amount of window space and with corresponding windows on the opposite sides of the ward are insisted upon. Under this arrangement the beds are placed between the windows, and never directly opposite to a window.

Q. 6518. Dr. Sutherland, in his comparison between the French and English hospitals, gives a similar opinion in favour of natural ventilation, secured by opposite lateral windows.

Q. 4375, 7, 8. An objection made by Dr. Mapleton, surgeon to the 15th hussars, to this form of construction is, that if the hospital be constructed of separate blocks, so as to ensure the greatest amount of lateral light, the wards must be larger than is thought conducive to the comfort of the patients. The terms "larger" or "smaller" are of course comparative terms; and we find that in the Paris hospitals the smallest wards are in the buildings constructed in separate blocks, and average about 25 beds per ward as against 80 in buildings of a different construction. Dr. Mapleton, however, prefers wards

Q. 4395. containing no more than 10 beds, on the ground that one man undergoing great suffering, or dying, disturbs fewer persons in a small ward than in a large one; though, on the

Q. 10,025. other hand, Miss Nightingale states that the effect of a death is more depressing in a small than in a large ward. There are also to be set against this the difficulties of administration and attendance, which are enhanced when the patients are so much subdivided, and a larger staff is required to secure equal attention and care in every ward.

It is likewise stated that it becomes more difficult with small wards to scatter the patients, so as to give a greater amount of cubic space to each, when the hospital is not full, as a reduction to, say five patients in a ward, would expose each ward to greater risk of neglect. Again, in a hospital which is also used as a medical school, the introduction into a ward of a large number of pupils is less inconveniently felt, both as regards air and space, in a large than in a small ward.

We are informed that a Russian medical officer deputed by his government to examine the hospitals in the chief capitals in Europe, with a view to the erection of a large hospital at St. Petersburg, who has just left this country, has decided on recommending separate block buildings, with wards lighted by opposite lateral windows, and containing 25 beds each, as the best construction for hospital purposes that he has seen.

Q. 4402. Another objection raised by Dr. Mapleton is, that the opposite windows create too much light in the wards, which is disagreeable to the patients.

It is believed by those best competent to judge, that the sun's rays have a great effect upon the purity of the atmosphere, and even upon the sick themselves, though the processes by which this effect is produced are not yet known.

It is obvious that it is always possible by means of blinds to darken, if necessary, a ward that is too light for particular patients, but it is not possible by any means to lighten a ward into which, from its construction, the sun has not sufficient access.

Q. 1528. Parian cement is in some cases used for the walls of the wards. Being less porous than brick or plaster, it absorbs no organic matter and can be washed with water.

Hospitals at Paris and Brussels.

We thought it advisable to depute two members of the Commission to visit the military hospitals and barracks at Paris and Brussels, with a view to obtain a wider field of comparison than is afforded by the naval or civil hospitals at home.

Q. 4285. Most of the hospitals recently built at Paris, both military and civil, which were visited by the Commissioners, were built on the plan now generally advocated by the civil practitioners of this country; the wards are for the most part in detached blocks, and are very spacious, having windows opposite to one another on each side, the beds being placed between the windows. They are so built for the double advantage of admitting as much sunlight as possible into the ward, and of securing the greatest amount of natural ventilation; but the extremely low range of the thermometer in winter at Paris appears in a few instances to have induced recourse to artificial ventilation, primarily for the purpose of securing economy in fuel in winter.

Another condition differing from those of our own hospitals has also contributed to the adoption of various systems of artificial ventilation in the Paris hospitals, namely, the

non-existence of open fire-places, which are habitually used in England, and the absence of which would here be felt as a great privation.

Some difference of opinion exists as to the merits of the various systems of artificial ventilation in use at Paris; a comparison of which will be found in the evidence of Dr. Sutherland. Q. 4297.
Q. 4318.

There can, however, be no doubt of the great superiority of the Paris buildings for the purposes of a military hospital over those of Chatham or Portsmouth. By the regulations of the French service, 740 cubic ft. is the minimum space allowed to wounds and fever cases, and 666 ft. for venereal cases; but in the military hospitals inspected the cubic space far exceeded the requirements of the regulations, and varied from 1,050 to 1,800 and 1,900 cubic feet; at Brussels also the military hospital gives 1,500 feet per bed. In our military hospitals the minimum required by the regulations is 600 cubic feet per bed; but the Table in the Appendix, marked xxxix. (iv.) shows that in a vast proportion of our hospitals there are wards in which the cubic space is far below even the minimum laid down. The walls of the wards in the Lariboisière hospital are of Parian cement, and can be washed with water. In all, the floors are of waxed oak. At Vincennes some wards contain 40 beds. At the Val de Grâce they contain 50 and 52. Q. 4334.
Q. 4345.
See App. No. xxxix. (iv.)
Q. 4326.
Q. 4341-2.

The beds and bedding are of a superior description to those in use in our military hospitals, each man lying on a hair mattress. We may here observe that the hair mattress is the best for hospital purposes. It does not readily retain miasma; and such as it may imbibe is easily dissipated by heat. It may be washed. It is not hard, and it saves the objectionable use of a blanket under the patient. It is in use in all the general, and is being adopted in the regimental hospitals in this country.

The kitchens in the French hospitals are generally extremely good and clean. Q. 4368

There are no water-closets, and the latrines are as bad as possible, and frequently very offensive, though special methods of ventilation are used, but unsuccessfully, to counteract the evil. Q. 4293.
Q. 4332-3.

The water supply, though ample for general purposes, is very defective in distribution, not being laid on to the upper floors, to which the water is carried up in buckets. Q. 4319-25.

The matters in which the French hospitals are superior or inferior to the English are those in which the same superiority or inferiority is to be found in civil life. In the spaciousness of the buildings, the excellence of the beds, and the means of cooking, the private house in France is superior to the English, while it is inferior in everything relating to the supply of water and to internal drainage and sewerage, which, next to ventilation, are the two most important points in a hospital.

In all other respects these foreign hospitals offer a contrast as marked and as unfavourable to our army hospitals as do the naval establishments at Melville and Haslar.

Military Hospitals at Home.

The contracted space and want of ventilation in our military hospitals do not give to the patients the same chance of recovery as is afforded by the better accommodation of the naval and civil hospitals of this country. Nor is their stinted and meagre appearance without its effect on the medical officers themselves. The young man who on joining the army arrives fresh from the establishments of London, Edinburgh, or Dublin, where he has seen the civilian patient tended with every appliance which can alleviate his suffering and hasten his cure, can scarcely fail to form a low estimate of the value attached by the government to the health and comfort of the soldier; nor can those who are in charge of our army hospitals feel that pride in their condition which is so strong an incentive in similar establishments elsewhere to their maintenance in the highest state of efficiency, while they keenly feel that by the public they are considered responsible for a state of things which they know to be far from creditable, but which they have neither power nor authority to remedy. We have already shown that the Director-General had not concealed from the Secretary of State the opinion he had formed of the state of the hospitals, and of the necessity of creating a new general hospital worthy of the objects to which it is to be directed, and of the nation by which it is to be provided. It is but just to the medical officers to state that the evils complained of in the particular hospitals we have described have been the subject of constant though fruitless representations on their part; but dependent as they are on other departments which have duties to perform to which the efficiency of the hospitals is necessarily secondary, it is not a matter of surprise that their remonstrances should frequently have been unsuccessful. Q. 2175-9.

The army hospitals are dependent on the Inspector-General of Fortifications for their repairs, and on the Barrack Department for their stores, furniture, hospital dresses and equipments, &c. With the exception of some articles which are provided by the purveyor, they are dependent abroad on the Commissariat for their rations, though the purveyor is empowered, if the rations be defective, to buy butcher's meat at a rate exceeding the Q. 1097.

Q. 1092. Commissariat price by 1*d.* a pound. The medical comforts are provided by the purveyor, and the drugs by the Director-General. The Engineer and Barrack Departments are set in motion by requisitions made upon them. They are in no other respect responsible for the state or the wants of the general hospitals, nor are they called upon by the nature of their duties to be present in them. If furniture, beds, or utensils of any description are required, the Principal Medical Officer makes his requisition on the purveyor, who again makes his requisition on the barrack-master, who supplies the stores required if they be on a certain authorized list, if not, then the purveyor applies to the War Office and is or is not authorized to purchase them himself. So long as the barrack-master has the articles in store, and complies with the requisition, his duty is fulfilled, and the purveyor has no authority to purchase anything which the barrack-master has authority to supply. It is clear that no improvement as to form or quality of the furniture, beds, bedding, or other equipments, is likely to take place under this system.

Q. 6729.
Q. 3384. If the building be defective, the ventilation inadequate, or the drainage imperfect, the same process is gone through, beginning with the medical officer, passing through the barrack-master, and ending in the engineer's department.

The necessity for executing all repairs, however insignificant, through the Engineer department, practically works to the detriment of the hospital. It appears in evidence before us that applications have been made for years to that department for the execution of works and repairs, some urgently necessary for the health and safety of the patients, which have either been long delayed, or in some cases not executed at all. The Director-General placed before us correspondence of various dates in which an Engineer Officer refused, on the ground that it appeared to him unnecessary, to execute a work which in the opinion of the medical officer was requisite for the health of the patients, the opinion of the engineer overruling the professional opinion of the medical officer, and even of the Director-General.

Q. 3414.
Q. 1349. In regimental hospitals the evil is less felt, though even in them the inconveniences are complained of. In the general hospitals the barrack-master makes a monthly inspection, when the necessary repairs are pointed out to him. Should any deficiency be discovered the day after the inspection, it would either have to wait till the next monthly inspection, or recourse must be had to a requisition marked "immediate," which is attended to as soon as the necessary correspondence will permit, and the engineer officer has satisfied himself of the necessity of the repairs, and the advisability of the contract, if a special contract be necessary.

Q. 3385-9.
Q. 3390-1. Small repairs, though equally requiring these preliminary forms before they are ordered, are executed by standing contracts fixing the prices of work, each repair being charged by measurement, wherever that is possible.

Q. 3390.
Q. 6735. The contracts are for three years, and by open tender, the lowest tender being accepted.

Q. 3406-8. Colonel Chapman doubts the policy of the open tender, through which inferior tradesmen under-bid the better class, and recompense themselves by the inferiority of their work.

On the other hand, it seems doubtful whether the triennial contract does not deprive the government of the advantage of a fall in the cost of material and labour, as the tradesman would, in a contract extending over so long a period, guard himself against the possibility of a rise.

Q. 3422.
Q. 3497. The annual estimates for the requirements of the hospitals as regards building or repairs are sent to the Inspector-General of Fortifications, and by him are submitted to the Secretary of State. If the totals of the estimate are found on reaching the Treasury to be too large for the probable resources of the Exchequer, they are returned for reduction, and the vote in which hospitals, together with all other buildings, civil and military are comprised, is submitted for reduction to the Inspector-General. The medical officers complain that under this system more than a due share of the reduction falls to the lot of the Medical Department, and they urge that the hospitals should form a separate vote which should be proposed to the Secretary of State, not by the Inspector-General of Fortifications, but by the Director-General, who could explain and defend the items of which it is composed. We are inclined to agree with this view, being of opinion that all matters concerning the efficiency of the hospitals should be the subject of direct communication between the Director-General and the Secretary of State, and not be left to the intervention of a third person not immediately interested in the condition of the buildings, namely, the Inspector-General of Fortifications. The sums allotted to each hospital for minor repairs might be applied under contracts made by the purveyor, with the sanction of the engineer officer of the district as regards both the terms of the contract and the sufficiency of the work when executed. To this proposal the Deputy Inspector-General of Fortifications sees no objection.

Captain Laffan states that the chief cause of delay in the execution of contracts on the existing system is their subdivision among different trades in lieu of their being placed in the hands of a builder, who would employ his various artificers on each class of work. At present the wood-work is contracted for by a carpenter, the brick-work by a bricklayer, the iron-work by a smith, the glass-work by a glazier, and so on; and these several and independent tradesmen are dependent on one another for punctual co-operation for the execution of any job, for the completion of which the work of each is necessary. The Deputy Inspector-General of Fortifications strongly recommends that these various contracts should be combined and placed in the hands of a builder, whose own men acting under his command would at once execute the work required. With this suggestion we cordially concur. Q. 6740-1.
Q. 6743.

As regards the original erection and construction of new hospitals at home, it appears latterly to have been the practice to take the opinion of the Army Medical Department, not only on the site, but likewise on the plan and distribution of the building. Thus, as regards the position and plans of the new general hospital now in the course of erection at Netley, on the Southampton Water, it appears from the evidence of Captain Laffan, the Deputy Inspector of Fortifications, that no step was taken without the opinion and sanction of the Army Medical Department. Q. 6728.
Q. 3016-18.
Q. 6797.
Q. 6804.

As we have been compelled to remark on the insufficient space and stinted accommodation afforded by our existing army general hospitals, we think it due to the Government shortly to describe the plan and extent of the contemplated general hospital at Netley, the erection of which, as a substitute for Fort Pitt, has been long urged by the Director-General, and which will be constructed upon a scale in every respect worthy of the object to which it is to be devoted. Q. 6813-30.

The building will consist of a centre containing the offices, accommodation for sick officers, and residences for three of the medical officers of the establishment, and the nurses; and two wings consisting of wards calculated to contain together 960 beds.

The kitchens, laundry, and other offices are placed behind the main building, together with sleeping accommodation for the orderlies; one corridor of ample width, and 1,400 feet long, runs the whole length of the building; it has a south-western aspect and commands a view of Southampton Water.

The wards are for the most part small, there being 4 with 18 beds, 9 with 14, 8 with 12, 4 with 10, 66 with 9, and 4 with 8 beds. They have a minimum cubic space of 1,420 and a maximum of 1,700 feet to each bed, and an interval of 4 feet between the beds. They are constructed side by side, each ward opening from the corridor by a door, on either side of which there is a window, through which the sun at certain hours of the day will penetrate into the wards, the corridor having been converted into a loggia, with open arches, which may be closed in with glass during winter. There will be two wards at each end of the two wings which face the south-west, which will command a view of the river.

The wards will be ventilated from the corridor on the one side and from the external air on the other by means of the cross draught from the windows which are at either end of the ward, and also by orifices made for the admission of fresh air, the foul air escaping through hollow flues in the walls. Q. 6832-41.

The windows are to have blinds, and to be made to open either partially or entirely, and both above and below. Q. 6819.

The water-closets adjoin each ward, but are cut off from it by an intervening lobby, to secure perfect ventilation. Q. 6843-9.

The kitchens are to be fitted with every requisite means of cooking for the sick.

We are informed that it is intended to receive officers as well as non-commissioned officers and privates into the new hospital; and as we are instructed to report our opinion as to the expediency of making provision in military hospitals for officers suffering from disease or accident incurred in the service, it is our duty to state that we are of opinion, that a large class who deserve well of the state, namely, officers who have contracted disease in the service of the state, will be greatly benefited by the extension to them of the advantages of accommodation and medical attendance at a cost far below what they can be obtained for elsewhere, while their contributions, though small in proportion to the advantages given, will reduce the net cost of the maintenance of the hospital.

The addition of the officers as patients will also add variety to and enlarge the practice and range of observation of the medical officers.

General Hospitals.

In all our past wars the general hospitals of the British army have been strongly condemned, and an argument in favour of the universal use of regimental hospitals has

been founded upon that condemnation; but of necessity every war re-establishes general hospitals, and it is important to inquire whether their past mal-administration, and the suffering consequent upon it, have not been the natural result of calling upon men to create them who have had no previous experience of their organization.

The only attempt made in peace to organize any hospital as a general hospital is where a congeries of regimental hospitals is collected under one roof.

Q. 10,042.

Under this system, if there are 10 regiments there are 10 surgeons, with their assistants, 10 hospital serjeants, 10 sets of attendants, &c., &c.; while in one hospital there may be two severe cases, and in another 20.

Under this system none of the 10 surgeons can be relieved from the multifarious duties which fall upon him as an administrative officer; and throughout it may be said that the division into 10 of what might be fused into one, necessarily involves waste of labour and expense.

When united, a small number of medical officers could discharge the duties of the whole. Certainly 20 medical officers could do the duty which in separate regiments is performed by 30, and opportunities would be afforded for giving leave of absence for study, or otherwise, to the remainder.

Q. 10,045.

With the united system the attendance is more easily distributed. The united system is also the best adapted for mutual information and for clinical instruction, for the teaching of specialties, and collecting the materials for study, practice, and experiment.

It also affords to the inspectorial officer better means of comparing the relative professional ability of the different officers acting under him.

On the other hand, while the regimental system is adhered to, each surgeon knows his men, and comrades remain unseparated from one another, though of course promotion occasionally introduces changes in the medical staff of a regiment.

Looking, therefore, at the fact that it is not open to us to discuss whether there shall or shall not be general hospitals in war, because it is admitted that there must be, our object should be to make them as good as possible, and to take every available precaution against the recurrence of the evils which have hitherto marred their efficiency.

For this purpose the organization which is to be effective in war must have been devised and practised in peace. Under the head of field hospitals we will state in what manner we consider the supreme authority in the hospital should be strengthened with a view to the more arduous duties and the heavier responsibility which a state of war will involve.

We recommend, therefore, that for the purpose of securing efficiency in our general hospitals in war, a limited number of general in addition to regimental hospitals be maintained in peace.

Q. 10,016-17.

Female nursing should be introduced in general hospitals, both at home and in the field, but not in regimental hospitals. No nurses, however, should be admitted except women of the efficiency, responsibility, and character of the head nurses in civil hospitals; say one to every 25 bad cases. The orderlies should do the same duties as are performed by assistant nurses in civil hospitals, under the head female nurse. She should be in charge of all that pertains to the bed-side of the patient; and be responsible for his cleanliness, and that of his bed and utensils; for the administration of medicine, of food, of the minor dressings not performed by the surgeon; in short, of all that concerns the personal obedience of the patient to the orders of the surgeon. She must accompany the surgeon on his visits, and receive his orders. She must also report any disobedience of the orderlies, so far as regards the patient's personal treatment.

The female nurses should be under a female head, whose duties must be carefully laid down, so as to be in accordance with a code of hospital regulations.

Q. 10,022.

The difference in point of neatness, order, and discipline observable in hospitals where women are habitually employed appears to us sufficiently striking to justify the above recommendations. Upon this as upon other subjects connected with hospital management we would refer to the valuable testimony of Miss Nightingale.

Q. 9,982 et seq.

We have had before us the new Warrant re-constructing the medical staff corps as a military body. In every general hospital there should be a superior officer acting as chief over all the hospital orderlies, nurses, and attendants, who should be in charge of all the wards and of all the furniture contained in the wards from the moment that it shall have been issued by the purveyor; and who should undertake the direction of the cooking and washing, and the general care of the cleanliness and order of the hospital.

Q. 2221-4.

Q. 2569.

Q. 2872-82.

We have taken but little evidence with regard to dispensers, the subject having been exhausted by the committee of the House of Commons on the medical department; but we are of opinion that competent dispensers duly attested for military service should be appointed to every general hospital, and form a part of the establishment of every regiment.

Our attention has been called by several witnesses to the position and pay of the hospital serjeant. His duties require more unremitting attention, and, what is still more important, the exercise of far more discretion than those of most of the staff serjeants.

In our opinion, the hospital serjeant should invariably be chosen for his superior intelligence and steadiness of character, should be placed on the same footing, as regards rank, pay, and pension, as the quarter-master serjeant, and should not be appointed or removed without the concurrence of the medical officer.

Provision for Lunatic Soldiers.

The treatment and cure of lunatic officers and soldiers have constituted an important branch of our inquiries, and we have taken into consideration the question, whether it would be advisable to provide for their treatment in military hospitals. The practice previous to the late war was to receive all lunatic soldiers in the lunatic hospital at Fort Pitt, where they remained under observation till the character of their malady could be verified, and their place of residence or that of their friends ascertained, with a view to their being removed to their homes. But there always remained a certain number concerning whose birth-place or friends nothing could be ascertained, and these were treated at the public expense. For some years previous to the war they were received at Yarmouth, where a naval hospital for which the Admiralty had then no occasion, was adapted to the purpose of an asylum. When the war broke out the building reverted to the Admiralty, who required it as a hospital for the sick from the Baltic fleet; and the military lunatics were removed, the officers to Coton Hill in Staffordshire, the privates to an establishment at Bow.

The numbers at present are, 23 at Chatham under observation; the officers at Coton Hill 18, the privates at Bow 80, besides 5 females, making in all 126; but of the 23 at Chatham some no doubt will be sent home to their friends, and be provided for in county asylums. These numbers have however been considerably swelled by the war, but will probably diminish with the return of peace. An abstract of the service of patients admitted to the lunatic ward at Chatham since 1853, shows that 50 per cent. of the whole number had served under five years, and 25 per cent. did not exceed one year's service.

But before the necessities of the war deprived the military authorities of the use of Yarmouth Hospital, namely, in 1853, there had been a question of breaking up the lunatic asylum there on different grounds.

The report of Mr. Gaskell, the Commissioner in Lunacy, who had been invited by the Secretary-at-War to inspect the asylum, and the report of Mr. Milton of the War Office, which accompanied it, were of so unfavourable a character, and the probability of finding in the ranks of the Army Medical Department any person sufficiently acquainted with the specialties of lunatic treatment to undertake its reform with any hope of success appeared so remote, that the authorities were inclined to think that greater security for the application of the best curative processes to the patients could be obtained in private asylums of high character, and under the inspection of the Commissioners in Lunacy, than in any government establishment.

Since the termination of the war the Commissioners in Lunacy have addressed the Secretary of State, and urged the creation of a government establishment which shall serve both as a lunatic hospital and asylum, and they urge the example of Haslar in support of this view.

At Haslar, about 130 officers and seamen of the royal navy and marines, being lunatics, are treated at the public expense. They are admitted without reference to the length of their service or the origin of their malady, nor is the expense heavy, the service from which the lunatics are taken being numerically small compared with the army. The asylum at Haslar was brought to its present state of efficiency by the late Dr. Anderson who happened to be a friend of Dr. Conolly's and to have studied under him. The proportion of cures to admissions is very satisfactory, being considerably in excess of the average, very nearly that of the Friends' Retreat at York, and only much exceeded by Bethlehem, as shown by returns during the last ten years, to which latter establishment, however, only recent cases are admitted and from which both epileptic and paralytic patients are excluded.

There are peculiarities attaching to the situation of Haslar which give to it, as compared with other asylums, great advantages in the treatment of seamen. The building is situated on the sea, and the airing grounds command a good view of Spithead. Boats are kept for the accommodation of the patients, who are daily sent out rowing and fishing, by which means those habits are maintained which have made a sea life almost necessary to the existence of a sailor.

Q. 2861-9.

App. No. xlv.

Q. 433.

Q. 441-2.

Q. 3819.

Q. 3816.

See App. xlv. and xvi.

Q. 6643.

Q. 3117-19.

Q. 3821-2 But Dr. Conolly, who attaches great importance to these peculiarities in the treatment of the seaman, draws a distinction in this respect between him and the soldier, more especially if it be not intended to return the latter to the ranks in case of cure, a practice which has long since been abandoned, most of the cases having originated in intemperance, and being frequently subject to relapse.

Q. 3850. He also doubts whether the number of military lunatics, generally about 80, would be sufficient for the purposes of classification, or would fully occupy the time and attention of one medical officer. He considers, however, that the soldier would derive advantage from the continuance of military discipline, though in incurable cases, which are the majority, he sees no advantage in a military over a private or county asylum.

Q. 3824. Mr. Gaskell, the Commissioner in Lunacy, attaches even greater importance than Dr. Conolly to the retention of the habits of military discipline as regards both officers and men, and would greatly prefer treatment in a government establishment to the present practice of placing the military lunatics in county and private asylums. He recommends a joint asylum for the military lunatics of the East India Company and the Queen's service.

Q. 6680. Dr. Conolly, on the other hand, gives a decided opinion against the treatment of lunatic officers in a military establishment, it being important, in his opinion, with educated persons to break as far as possible all associations with their previous lives.

Q. 3858. Dr. Conolly speaks highly of the Coton Hill establishment, where the lunatic military officers are now placed, and with which he is himself acquainted; and he states that the asylum at Bow, where the privates are treated, is well reported of.

Q. 3880. So far as expense is concerned, there is, according to the evidence before us, but little difference between the two systems.

Q. 6688. After well weighing the various considerations which can be adduced in favour of either system, we incline to the opinion that upon the whole the Secretary of State has come to the right conclusion in proposing to erect at Netley, for the treatment of lunatic invalids, a lunatic hospital, and not to attempt the erection of a lunatic asylum, but to trust, as at present, to civil establishments for the permanent reception of military lunatics. The double inspection of the Lunacy Commissioners and of persons deputed by the War Department, and the interest which the authorities of these asylums have in conforming to all suggestions made to them, form, as it appears to us, an efficient guarantee for the comfort and well-being of the patients. We likewise feel that when so many and great changes, all involving considerable expense, are necessary in order to place on a footing of efficiency those establishments which the military authorities must from the nature of the case maintain, it would not be judicious to force upon the government additional duties which can be as well performed in civil establishments.

App. No. xliv. *Distribution of Duties in Hospitals.*

We have examined the governors and resident medical officers of some of our largest civil hospitals, and carefully inquired into their practice, as also that of the naval and the military hospitals, whether they be general, regimental, or agglomerated regimental hospitals; first, as regards their general system of administration; and secondly, as regards the distribution of duties between the medical officers and the various other functionaries on whom devolve the supply and maintenance of the establishment.

Q. 10,057. As regards the first head, it may be stated shortly that the civil hospital has one committee, who authorize the supply of all the hospital; one treasurer, who administers the finance; one secretary, who corresponds; one superintendent or house steward, who issues; one kitchen, which cooks; and one laundry, which washes for all the hospital. It has one surgery, one apothecary, one pharmacy and laboratory, one set of attendants under one head, one set of accounts, one set of medical officers, one operating theatre, one dissecting room, for all the wards of the whole hospital. There is not a bad or peculiar case in the hospital which may not be seen by all the medical officers. There is not a physician or surgeon who is not called into consultation with all the rest, so that the experience of each man becomes, to a certain extent, the common property of all.

In the military general hospitals the same unity of action is sought to be attained, but, as they are now constituted, the governing power is wanting which by its superior authority can compel the co-ordinate departments within the hospital to the complete co-operation necessary for success.

Q. 324. In the naval hospitals this object is attained, where the hospital is small, by placing the supreme power in the hands of the principal medical officer; and where it is large, in the hands of a governor, who is generally a naval officer of rank.

Q. 366. But in the agglomerated regimental hospital a part only of the general system is obtained. There is one kitchen, which cooks for all the wards, each of which is a separate

regimental hospital; and in some instances, there is one pharmacy and one dispenser, but there are separate accounts, separate classification of patients, and separate medical officers to each ward.

The regimental hospital is, of course, separate and distinct in every respect, and is necessarily the form of hospital usually adopted in the British army.

With these preliminary remarks, pointing out the characteristics of the different kinds of hospitals, the practical working of which it has been our duty to consider, we return to the comparison of the different organizations which obtain in the civil, naval, and military hospitals. In this comparison we are especially struck by the wide difference existing in the position of and in the character of the duties exacted from the medical officers.

In the civil hospitals the duties of the professional men are exclusively professional. The physician and surgeon prescribe and operate. Whatever treatment they order is followed, whatever diet they prescribe is administered. But the attention of the seniors is never distracted from the exercise of the higher duties of their profession, by the necessity of attending to the household details involved in the management of the hospital. They are relieved from all such drudgery. They bring all their learning, experience, and skill, to bear on the cases submitted to them in a hospital, where every appliance is found to their hand, and where every material want of the patient is supplied by those who not only can execute such duties better than the medical officers, but whose time is far less valuable, and cannot be better employed than in their performance. Under the superintendence of a committee or a governor the steward and the matron execute all the details of administration at an expense proportionate to the subordinate character of the duties which they discharge. Q. 568.

In the naval hospitals the same practice is observed, though in a modified degree. The higher the medical officer rises in his profession, the greater is the amount and responsibility of the medical treatment which devolves upon him. The agent, who corresponds to the house steward in civil hospitals, and to the purveyor in the army hospitals, purchases and issues everything deemed requisite by the medical officer for the comfort of the patients, or the completeness of the hospital. When there is, as at Haslar, a naval officer as captain superintendent, the medical officers stand precisely in the position of the civil practitioners in the London hospitals. Where there is no captain superintendent the Principal Medical Officer stands in the place of the superintendent, but is not on that account relieved from his strictly professional duties; and self-dependent as the naval hospitals are through the powers entrusted to the agent, in lieu of depending for the supply of their wants on the intervention of other departments, this additional duty imposes upon the medical officer no burden incompatible with the execution of his purely medical functions. Q. 323. Q. 386. Q. 349. Q. 355. Q. 376. Q. 466-9.

In the army the system is entirely different. It is thus described in the report of Mr. Cumming and Mr. Maxwell, on the hospitals in the East:—

“The supply of medical attendance, if it were judged by a simple comparison of the number of medical officers of all ranks on duty with the number of patients, would appear larger than it is practically, because the duties of the higher ranks of the service are almost wholly foreign to the professional treatment of the sick or wounded. The duties of the inspector-general and of the deputy inspectors are altogether administrative; the former is the governor of the hospitals, the latter assist him in the work of general superintendence and control. The sick and wounded are treated by second-class staff surgeons and assistant-surgeons, to each of whom wards are assigned. The principal medical officer is, further, daily engaged in seeing to the cleanliness of the wards, the distribution of the meals, the collection of the daily returns of his inferior officers, and the compilation from them of his own. Lastly, he is incessantly called upon, at every period of the day, to inquire into the reality of the alleged wants of articles of purveyors' stores arising in his division, and of countersigning the requisitions of his subordinate officers for them, when he has satisfied himself that the things are needed. These multifarious avocations leave him practically no time for attending to the most important of all his duties, and those which he is by education and experience best fitted to perform.” Rep. Hosp. in the East, p. 30.

By this system it is true that the juniors are enabled very early to acquire a great amount of experience; but they acquire it to a great degree at the expense of the patient—they learn their mistakes by the results. The superintendence of the inspector, who has not observed the case from its commencement, is not of great practical value, especially when the number of cases is very large and his attention is distracted by the details of the administration of the hospital. A patient treated by an inexperienced junior, and superintended, or rather interfered with, by a pre-occupied senior, is as little likely to gain by the interference of the one as by the original treatment of the other.

All the evidence taken on this subject agrees in disapproval of the present practice. Sir B. Brodie states that his duties at the end of 32 years, during which he was surgeon at St. George's, were the same as on the day he began. He is of opinion that everything Q. 564.

which a surgeon requires should be found, and everything which he orders should be done, but it should be done to his hand, his time being too valuable to be spent on any duties to which his medical science and experience are not available.

Q. 566-8.

Q. 546.

We cannot but think that in addition to the direct loss to the state by the misapplication, which is the waste, of the valuable time of the seniors, this system has, indirectly, a bad effect on the juniors. Every young man looks forward to the ultimate attainment of high rank, and to the performance of the duties which belong to it. He naturally attaches the highest importance to those functions, and he insensibly learns to undervalue those which seem to belong exclusively to the lower grades, and from the practice of which he hopes, by promotion, to be emancipated. The assistant-surgeon is led by the present system to look to the performance of administrative duties as the ultimate object of his ambition, and knows that when once he can reach an inspectorial rank, it is on their performance, and not on his medical skill, that his reputation and his further chance of advancement will depend. The result must be to lower his estimation of the highest duties of a scientific profession, and diminish his ardour in its pursuit.

Neither is it without its ill effect on the senior who, when retired from the service, does not compete with the civilian practitioner on terms so advantageous as he would have done had not his medical practice been partially suspended, and his skill and science allowed to rust during the years in which he was employed on those administrative duties which occupy so much of the time of the inspectorial ranks. Our opinion of the impolicy of allowing so much of the valuable time of the medical officers to be consumed in household details, is strengthened by the following observations in the Report on the State of the Hospitals in the East, in which it is stated that—

Rep. Hosp.
in the East,
p. 37.

“The supply of such articles in the wards is in practice thrown, in these establishments, on the medical officers in charge of wards, whose requisitions, as we have already noticed, need the counter-signature of the staff surgeon of the division. We think that this duty should not be cast upon the medical officers. It is, in our opinion, an evil that the wards of a hospital are not furnished with their periodical supply of sheets, shirts, and even of fuel or candles, or obtain their full complements of bedsteads, bedding, and other articles of furniture, without a formality which encroaches upon the time and interferes with the legitimate duties of medical men.”

All the evidence which we have taken on this subject, and especially that of Mr. Taylor, Dr. Rowdon, Mr. Pratt, the purveyor at Chatham, and Mr. Scott Robertson, now the purveyor-in-chief, have satisfied us that the relations of the purveyor to the medical officers require to be more clearly defined, and the duties of the former to be re-modelled and extended.

Q. 7175-6.

The purveyor's department had been suppressed in the year 1830 as a measure of economy. The purveyors were pensioned off, but the existing deputy purveyors continued to discharge their functions, though it was intended that eventually the office would be abolished. In 1853, however, and before the deputy purveyors had died off, the department was re-established, partly with a view to check the expenditure, and partly to prevent a considerable amount of small peculation which had existed in the service of the regimental and garrison hospitals where no purveyors were stationed, and where the supply was effected through the intervention of the hospital serjeants.

Q. 7179-80.

Q. 7183.

In this latter respect the re-establishment of the purveying system was entirely successful, but as a check upon extravagance—that is as a check on the diets prescribed for the patients by the medical officers—it probably cost more than it saved, inasmuch as the subject matter of the retrenchment was one which admitted of very small financial results, while in the interest of the patients, and therefore of the State, it required to be dealt with in a liberal manner.

The system as then carried out placed the purveyor in a position antagonistic to the medical officers, and at the commencement of the war so much practical inconvenience resulted from it, that it was necessary to issue fresh instructions to the purveyor, placing him in his proper position as subordinate to the medical officer, and bound to execute his orders and procure whatever he might prescribe as necessary to the comfort or restoration of the patient.

With the exception of these regulations there are no instructions for the purveyor's department, and of these some are stated to have been applicable only to the army in the East, and to have no bearing on the present duties of purveyors. New instructions are in preparation at the War Department, and have been submitted to us. They consist of no less than 240 articles, but it appears to us that with the changes we shall propose in the duties and position of the purveyor, they might be greatly shortened and simplified.

Q. 1148.
Q. 1576.

At Scutari the ration was at one time contracted for by the purveyor, and at another by the commissariat, and the supply sent direct from the contractor to the hospital, an account being kept between the purveyor and the commissariat. At Chatham Mr. Pratt states that he contracts for and supplies the bread and meat as well as the medical comforts, including wine. This rule holds good with all hospitals in England, both general and regimental. The barrack-master supplies the furniture, provided the articles are included in an authorized list which has remained unaltered for many years, and provided he has the articles in store. All articles not on that list, though of a similar character, are supplied by the purveyor—thus the barrack-master supplies round towels and the purveyor square ones. The barrack-master supplies saucepans and boilers, and the purveyor pudding dishes, gridirons, and frying-pans. Q. 1135-36.
Q. 1110.
Q. 1287, 1706.
Q. 1190-1.

Without going into further details, it is obvious that as in the naval and the civil so in the military hospitals there should be but one source of supply for all that is necessary for the efficiency of the hospital, and that the officer charged with those duties should be an officer of the hospital, responsible to the principal medical officer both for the sufficiency and the quality of the articles supplied. The purveyor should have the hospital completely fitted with everything requisite for the number of patients it is calculated to accommodate, according to a revised list of articles necessary. He should have a reserve in store to meet wear and tear, or any sudden emergency through an outbreak of sickness; and he should at once and without requisition supply, for every patient, bed, bedding, table, chair, hospital dress, and utensils of every description, whether for his meals or for other purposes, according to a schedule to be laid down in his instructions.

No requisition will then be necessary, except where any article not enumerated in the list, or any nourishment not included in any of the diet tables, is required by the Medical Officer, whose order should be a voucher to the purveyor, and bear him harmless with the authorities to whom he accounts. In no case should the purveyor consider himself at liberty to judge whether the article be necessary or not; but it would be his duty, if the order appeared to him excessive, to report his opinion to the purveyor-in-chief after he has supplied the article, and the subject would then come under the cognizance of the Director-General.

In every hospital there should be kept a list of the articles necessary to the completeness of its equipment, and a table showing what things a patient should be entitled to have issued to him on his arrival.

We may observe that a considerable step has already been taken in this direction by a late order from the War Office, authorizing the issue, from the hospital stores, of several articles which heretofore the patient produced from his kit. The purveyor-in-chief states that the system we recommend is in partial operation at this moment, inasmuch as the quickest means the purveyor has of getting stores is to apply for authority to buy them. He has had several applications of this description since his return from the East, and he submitted to the War Office that the purveyors should be allowed to buy, by which arrangement the delay caused by so much reference from one department to another has been avoided. Q. 1613
Q. 1585.

Under the arrangement we recommend, the whole washing of the hospital would likewise be done in the hospital or by contract.

The first objection raised against the proposed system is, that the contracts, being smaller when separated from the general barrack contracts, might not be obtained at so low a rate. We doubt, however, whether this be so, inasmuch as many of the articles (and those the most expensive which are required in a hospital) are, or ought to be, of a different quality from the same class of articles supplied to a barrack. Thus, for example, the hospital bed should be larger than a barrack bed, and a hair mattress should be supplied in place of the paillasse; and these articles, if of a better quality, must be the subject of separate specification, if not of separate tender, whether the contract be in the hands of the barrack-master or the purveyor.

The second objection advanced is that at small out-stations occupied only by a detachment, where no purveyor can be placed on account of the expense, the stores would be devoid of efficient protection. This argument, however, is as applicable to the existing system as to the proposed change, and the difficulty would be met in the same way, namely, by entrusting the custody of the stores to the barrack serjeant, who will discharge the same duties as now, with the single difference that he will account for these stores to the purveyor instead of the barrack-master. Q. 1754.
Q. 1764-8.

The system of concentrating the troops which is now being adopted both at home and abroad will also make the occasions on which recourse must be had to this expedient far less frequent than they have hitherto been.

- Q. 7187. No increase to the number of purveyors will be requisite to carry the proposed system into effect, the purveying system having been extended to the colonies in the year 1856, on the ground that it is expedient to relieve the medical officers as much as possible of non-professional duties, and to guard against the recurrence of irregularities which were brought to light in some colonies where the purveying duties had lapsed into the hands of the hospital serjeants.
- Q. 7185.
- Q. 7180.
- Q. 7186.

With these observations we close the subject of the construction, supply, and organization of the army hospitals in time of peace. As regards the selection of site, and the original construction, we recommend that in all cases competent medical sanitary officers should be consulted, and the opinion of those most conversant with the interior economy of large civil as well as army hospitals be taken before any plans are finally approved.

We recommend that the present minimum space allowed by the regulations to each bed be increased from 600 feet at home and 800 in tropical climates to 1,200 at home, and 1,500 in tropical climates; and that a minimum distance of 4 feet between the sides, and 12 feet from foot to foot, and as much more as the size of the ward will allow, be maintained between the beds.

As regards the construction of new hospitals, we recommend the adoption of the plan of separate pavilions with lateral windows on opposite sides and natural ventilation.

We recommend the adoption of Parian cement or other impervious material for the walls and ceilings of hospital wards in lieu of bare brick or plaster. Also, the universal use of hair mattresses.

We recommend that sufficient provision be made for warming and lighting the hospital according to the weather and season, on the requisition of the medical officer in charge of the ward.

That water-closets be built in connexion with every hospital, and an efficient sewerage effected by impervious drains not passing under the building, all cesspools in the immediate vicinity of hospitals being done away with, and that the building containing the closets and sinks be cut off from the hospital by a ventilated lobby.

That suitable lavatories, baths, and laundries be provided.

That the stair-cases and landings should in all cases be constructed of stone.

That proper ranges and ovens be put up in the kitchens of every hospital, so that meat may be stewed or roasted as well as boiled, and a sufficient variety in the preparation of food may be afforded to the sick.

App. Nos.
xxxv. and
xxxvi.

As these changes will necessarily extend over a very wide field, as a reference to the evidence, and to the tables describing the present state of army hospitals, and the limited amount of cubic space afforded to each patient in the majority of them, will show, we recommend that the Commission already named for barracks shall include hospitals in their operations, and that they shall confer with the medical officer and barrack-master of each inspected hospital, and shall devise and execute, with such expedition as the available resources of the Government may permit, the necessary works, until every army hospital in use shall, in its turn, have been brought to a healthy and satisfactory condition.

We recommend that in future the vote for the building and repairs of hospitals should be separated from the vote for other military buildings, and that the estimate for the former should pass through the office of the Director-General, and be by him presented to the Secretary of State.

We recommend that in the case of items below a certain amount, and forming part of the annual estimate allotted for the repairs of each hospital, the purveyor be required to cause the repairs at once to be executed upon the standing contract made by the engineer without previous reference to that officer; and in the case of larger repairs which, though within the sum originally voted, require a special contract, the purveyor be empowered under the direction of the governor or principal medical officer, as the case may be, to enter into such contract, subject to the approval of the engineer officer, both as to the terms of the contract and the sufficiency of the work executed.

That the standing contracts, in lieu of being made separately with different trades, should be made with builders who would execute the whole work through the various artificers employed by them.

As regards the distribution of duties between the various officers of the hospitals, we recommend that the duties of supply and account, in lieu of being divided as now between several officers and departments, be vested entirely in the purveyor, who shall lay in all the furniture and utensils of all kinds necessary for the use of his hospital,

according to a list to be laid down in his instructions, keeping a certain reserve in store, and issuing, without requisition, to every patient all the articles prescribed in his instructions as necessary for the personal use of the patient.

We recommend the adoption of revised diet tables, with such alterations as may be thought advisable with reference to climate and other considerations, the object being to reduce the number of extras for which a requisition on the purveyor is necessary.

We recommend that in all hospitals to which no Governor is appointed the purveyor be placed by his instructions distinctly under the Principal Medical Officer, whose orders he shall always obey; but in case of apparent extravagance either in quantity or quality, the purveyor shall report to the purveyor-in-chief, after obeying the requisition, in order that the case may be brought under the cognizance of the Director-General.

By this arrangement the medical officers will be relieved of much of the drudgery of the household details which now devolve upon them, and will be enabled to devote their whole time uninterruptedly to their professional duties, and the inspectorial officers need no longer be debarred from taking their share in the treatment of the sick.

With the same object we recommend the adoption of simplified forms of admission books, monthly diet rolls, and returns, and that only serious and interesting cases be entered in the medical registers.

With a view to habituate the medical officers of the army with the conduct of large general hospitals, we recommend the substitution of a general hospital with a suitable scheme of organization and government, in accordance with the preceding recommendations, at Dublin and Malta, or at such other stations as the Secretary of State may select, for the agglomerated regimental hospitals now in use, and that female nursing, under the limitations we have specified, be introduced into general hospitals.

We recommend, as regards military hospitals, that apartments be provided for the reception of officers for treatment in the hospital at rates to be decided on by the government.

We likewise recommend the creation of lunatic wards at the principal general hospital, for the reception or observation of lunatic invalids, as is now done in the new lunatic hospital at Fort Pitt; but we do not at present recommend the Government to erect a lunatic asylum for the reception of incurable or other lunatics from the army, now treated in county or private asylums.

Field Hospitals.

As regards the equipments of field hospitals, Sir John Hall, Mr. Alexander, and Dr. Mouat have brought to bear upon this question the most recent experience gained by them as medical officers of the army in the East. Q. 5287.

In the Appendix will be found a complete list of the medical equipments suggested as necessary for the use of a battalion, a brigade, and a division in the field. See App. Nos. xlix. and l.

It is proposed that when any deficiency exists in this equipment, it should be supplied on the requisition of the regimental, brigade, or divisional surgeon, as the case may be, without the formality of any countersignature. This proposal is in strict accordance with the recommendation made in the Report of the Commission of inquiry into the Hospitals of the East. Those recommendations were as follows:— Q. 2616.
Rep. on Hospitals in the East, p. 13.

“That every regiment should always be supplied at once with its due allowance of hospital accommodation and furniture, without requisition.”

It seems to us desirable, in order to obviate, on the one hand, complaints which have been made as to the difficulty of obtaining certain medicines, and on the other, the objections which have been raised against the great variety of medicines for which requisitions have been made, that a military drug-list and Pharmacopœia adapted for field purposes should be drawn up, containing only such materials as experience has shown to be absolutely necessary for the treatment of the sick and wounded; and that, in order to make the selection and the forms as efficient as possible, the duty be committed to the representatives of the different colleges in conjunction with the army medical department.

“That a store of medicines and medical comforts sufficient for the probable wants of the army for three months, should always be kept at head quarters, or some other place easily accessible to the various divisions of the army.

“That the store of medicines and medical comforts kept with the regiment should always be sufficient for at least a fortnight’s probable consumption.

“That these stores should be replenished periodically from the principal store without requisition.

"That when the regimental stores fail before their periodical replenishment, the requisition of the regimental surgeon should be complied with, without the approval of the medical officer of the division; and, to prevent fraud, that the whole of the requisition should be in the hand-writing of the surgeon."

Agreeing as we do with the recommendations above quoted, we are, however, still of opinion that supplies beyond the amount laid down as the regular field equipment ought not to be obtainable without the counter-signature of a superior authority. As no foresight can guard against all the eventualities of war, and as the most careful pre-arrangements may be defeated by unexpected circumstances, and the troops be for a time deprived of or stinted in their supplies, it is necessary that a superior discretion should be exercised as to the quantities which can be granted to any one portion of an army without incurring the risk of leaving the remainder comparatively unsupplied.

We think that hospital marquees should be issued in fixed proportion as part of the regular equipment to every division, brigade, and battalion without requisition.

As regards the practice in the late war, we again quote from the Report of the Commission on the Hospitals in the East. The Commissioners state:—

Rep. Hospitals
in the East,
P. 13.

"We learnt that the issue to regiments of huts and marquees and other articles was made only upon requisition. We think that the consequence of this practice may be observed in the hospital accommodation which the above table exhibits. The condition of the sick varies in every regiment, and it varies in great measure with the energy and zeal of the commanding and medical officers, and with the means of transport at their disposal. We think that the state of the men should not be left dependent on such circumstances."

We would here observe, that in no case when it can possibly be avoided should the sick be treated in bell tents. They are described as hot in summer, wet in autumn, cold in winter, unpleasant during windy weather, too confined for the performance of professional duties, ill adapted to the nursing of sick men, and far too limited on the floor to enable medical officers to render patients in any degree comfortable. On the line of march they may suffice as a shelter for transient and slight cases.

On the other hand, marquees can be made comfortable in a standing camp by means of portable bedsteads arranged on each side, with a passage along the middle. They are temperate in hot weather, dry when it rains, moderately comfortable during the prevalence of high winds, afford greater shelter than bell tents against cold, enable medical officers to approach the patients with more comfort to themselves, and permit the orderlies to attend better to the wants of the sick. But it is of the utmost importance that they should be thoroughly ventilated, in which respect there is great room for improvement.

Q. 3181.

How little the advantages of marquees are sometimes appreciated, and how necessary it therefore is that their employment should be made a subject of regulation, is shown by the following statement made by the surgeon of the 4th Dragoon Guards, who says,—

Rep. Hospitals
in the East,
P. 69.

"I have made several ineffectual efforts to obtain a marquee from the purveyor at Balaklava, both by personal application and through the medium of requisitions, but have always failed in procuring one, there being none in store. When the 4th Dragoon Guards disembarked at Balaklava on the 1st October, Surgeon Pine landed the hospital marquee, but was ordered immediately to re-ship it by the Quartermaster-General of the Cavalry division; in that way it has been lost to the regiment."

But no regulations fixing the amount of field equipments for hospitals in war can be of the slightest avail in securing to the men the means of arresting disease or alleviating their sufferings, whether from wounds or other causes, unless the regulations of the military train allow of a separate or permanent supply of horse and wheel transport for the medical as for every other department. It was stated to us, by Sir John Hall, that on the occasion of the embarkation of the troops at Varna for the Crimea, a staff officer took upon himself to disembark and return to the shore the mules and waggons allotted for the transport of the ambulance and field hospital stores. It is indisputable that during the march from Calamita Bay to Balaklava, including the battle of the Alma, additional suffering and loss of life were entailed, by this heedless proceeding, on troops already sickly.

Q. 5366.

The establishment of the military train as a separate service will, it is hoped, obviate much of the evil from which the troops suffered during the war in the East, provided the arrangements be such as to secure to each department the means of immediate movement for all ordinary purposes without requisition. It is obvious that if on every daily occasion where transport is required the accommodation is to be procured by means of a requisition on the authorities of the military train, who in an army occupying an extended line of country may be miles away, great delay and consequent detriment to the service must ensue. It must be recollected that the carriages of the medical department are peculiar to them, and unavailable for any other service.

Q. 9947.

The ambulance carts, mule litters, and cars convey the sick, and can convey nothing else; but they are useless for their own purpose unless permanently as well as sufficiently horsed.

The same observations apply, though in a less degree, to hospital ships, which after carrying the sick home should take out medical stores, though they should likewise be made available for all other stores for the use of the army, which they can receive compatibly with their peculiar fittings.

We cannot dismiss the subject of hospitals to be established in war without noticing the great amount of mismanagement, failure, and suffering which resulted during the war in the East from the non-appointment, over the large general hospitals established at the base of operations, of some officer in the capacity of governor, whose whole time should be devoted to the creation and development of such hospitals, and who should be a man of such rank, weight, and judgment that the Government should be enabled distinctly to vest in him the largest powers and discretion as to expenditure. At the outbreak of hostilities he would at once proceed to the seat of war, and with the aid of a sanitary officer and an engineer would select the buildings to be converted into hospitals, and put them in proper sanitary condition. He would order the necessary fittings and alterations. The principal medical officer, the purveyor, and the superintendent of hospital attendants would form his council, with power to make and to minute such suggestions as they may think proper, for the consideration of the governor, who, however, should have the absolute power of acting on his own responsibility. He would thus be supreme over all the departments whose co-operation is necessary within the hospitals, but he should be debarred by his instructions from any interference whatever in the medical treatment or practice.

Q. 9917.

Q. 9929.

This officer should be held responsible for the material efficiency of the hospitals, by which arrangement the medical officers would be relieved from all administrative duty, and be enabled to devote their whole time uninterruptedly to the treatment of the sick.

Had such an officer been appointed at the commencement of hostilities in 1854, or even later, there can be no doubt that financially an immense saving would have been effected, and, while due economy would have been regarded, a great diminution both of suffering and of mortality would have been secured.

It has been suggested to us—and we think the suggestion worthy of record—that in war the general commanding-in-chief should, if the nature of the operations permits it, be entirely relieved of all charge and responsibility so far as the general hospitals at the base of operations are concerned. They would, however, remain, as now, subject to inspection by any officer deputed by the Commander of the Forces, and duplicate returns of the state of the hospitals and progress of the patients would be forwarded simultaneously both to the Commander of the Forces at the front and to the authorities at home. In the war in the East, the great hospitals of the army were divided from the army itself by the Black sea; and from the commencement these establishments depended in a great degree, and latterly almost entirely, on direct communication with England for their supplies. They were far beyond the reach of the Commander of the Forces, or of the chief medical officer of the army, and were virtually governed from home, though the responsibility was still nominally vested in these two officers whose whole time and attention were necessarily absorbed by the administration of the army at the front.

Q. 9948.

The hospitals, however, had not all the advantages which an avowed and complete separation would have secured to them. For being in one command with the army in the field they were affected by all the changes which death or promotion created at the front, and suffered all the inconveniences incidental to a too frequent change in the medical staff, by whom they were administered.

The insular position of England makes it probable that the base of operations in any war in which she may be engaged will be on the sea-board of the country in which the operations are conducted, and consequently as accessible to the home authorities as to those with the army in the field in the interior. Still the character and peculiarities of every war vary so much that it is impossible beforehand to lay down any rule on a subject on which such a decision must be made by the Minister directing the war as circumstances at the moment may dictate, but the suggestion appears to us to be one worthy to be recorded and considered.

But while offering these remarks on the government of general hospitals at the base of operations, we must declare against the retention in them, on any account, of patients who shall have so far recovered as to be in a fit state to be conveyed home in ships properly fitted for the purpose, if not likely to be fit for service in the ranks, provided, of course, that the army is so situated as to make such arrangements possible. The constant withdrawal of all patients equal to the voyage to England has the best effect on the men

App. No. xlviii.

so sent home and an almost equally good effect on those who remain, and who in the meanwhile have all the advantage derivable from increased space and diminished pressure on the medical officers and on the general resources of the hospital. This course was recommended by the Director-General during the late war, and was partially carried into effect.

We recommend, therefore, that a fixed scale of equipments be laid down for field hospitals for a battalion, a brigade, and a division.

That deficiencies or diminution of stock in this equipment be supplied on the requisition of the officer in charge of the battalion, brigade, and division, without counter-signature by any superior authority.

That all requisitions beyond the scale laid down should be countersigned before they can be available as vouchers to the issuer.

Q. 3182.

That hospital marquees should form part of every field medical equipment, and the bell tent never be resorted to for the treatment of the sick, except on the line of march or on occasions when from unavoidable circumstances no better accommodation is attainable.

That a certain amount of horse and wheel transport be permanently allotted to the medical department, as to all other departments, and that the same rule be observed as regards sea transport, so far as the exigencies of the service will permit, with due regard to the wants of all other departments necessary to the administration of an army in the field.

That on the outbreak of war an officer of rank, chosen for his administrative powers, tact, and judgment, be appointed governor of the general hospitals, who should be supreme on all matters of administration, and over all the departments whose co-operation is necessary within the hospitals.

Lastly, that on the outbreak of hostilities immediate steps be taken to secure the necessary means of transport for the removal to England of such patients in the general hospitals as may be equal to the voyage, and not likely to be soon fit for duty in the ranks.

Inspections.

Q. 2659-60.

2675.

2690.

Q. 4501-9.

Some complaint has been made to us as to the frequency and minuteness of the inspection of the hospitals by the inspecting medical officers.

Q. 2663-4.

It is argued that the regimental surgeon having under his charge the health of a battalion, and being an officer of fifteen years average service, is as competent as he ever can be to discharge the duties committed to him, and that the weekly examination into every detail of the management of his hospital tends to relieve him from responsibility rather than to fix it upon him. The same observations apply to the staff-surgeon in a general hospital.

Q. 2673.

On the other hand it is stated that without inspection, especially at unexpected times, there is little guarantee for efficiency, and these checks are necessary to secure the attention not of the zealous and efficient but of the listless and indifferent officer. We should hope, however, that the tact of the inspectorial officer would be exercised not only as to the frequency but as to the manner of conducting these inspections. Among combatant officers, where the duty of one rank is to decide and to command, and that of the others is solely to obey, and that immediately and implicitly, without any exercise of discretion in the matter, the necessity of an instantaneous obedience has naturally generated, and justifies a peremptory tone of command. But there is no analogy between their relative position and that of the higher and lower ranks of the Medical Department as regards either the division of duties between them or the character of the duties themselves. In the Army Medical Department the inspector and inspected are both men of science, and the latter is actually engaged in treating, at his own discretion and on his own responsibility, the patients who have been entrusted to him on the presumption of his competency. The assumption on the part of a superior medical officer of a peremptory tone in addressing his junior shows a want of appreciation of the dignity of the profession to which both belong. A rebuke addressed, or a doubt thrown on the treatment, in the presence of the patient shakes the confidence of the latter in the medical officer in whose hands, without any choice of his own, he is placed, and may even mar his chance of recovery.

We are satisfied that such departures from propriety, meriting as they do the severest reprobation, can be but of rare occurrence; and we have made these remarks in the belief that they will strengthen the hands of the Director-General in checking them when they do occur.

We recommend that the duties of inspectorial officers be defined by regulation, and that the regulations be printed for the information of the service.

Returns, Registers, &c.

Our attention has been drawn to the complaints, made by the medical officers, of the great amount of clerical labour thrown upon them by the cumbrous nature of the returns required of them, and the unnecessary writing caused by the unceasing and frequent recourse to the system of requisitions.

It appeared to us that the true way of diminishing the necessity of a frequent recourse to requisitions upon the purveyor is to introduce variety in the ordinary hospital diets, on which subject we have already made a recommendation, so as to comprise under the head of a diet such of the extras as are now the most usual subjects of requisition; indeed, it not unfrequently happens that a patient is continuously and almost entirely dieted on extras, which must, nevertheless, be the subject of daily requisition. As the diet table is as complete a voucher to the purveyor, this change would greatly diminish the amount of writing and the number of separate transactions involved by a recourse to requisition, without in any degree diminishing the financial check upon the expenditure, which we consider it a paramount necessity to maintain.

With the same object we have examined the admission books and the medical registers. The latter contain a record of cases which every executive medical officer is compelled to keep. The evidence before us differs as to the degree of minuteness with which they are kept. The regulation requires that an entry should be made daily on each case in the hospital, without reference to its importance; but though such a system of entry is not invariably adhered to in practice, we are satisfied that these registers are too voluminous and too indiscriminate to be of much after-value either for medical or other purposes. Many of those who compile them no doubt feel that a record so voluminous and so uninteresting is not likely to be read, and is scarcely worth much time or attention in its compilation. From the number of trivial cases entered, sufficient details cannot be given of really important cases.

It has been stated, in justification of the present minute system of entry, that these registers are useful in invaliding cases, as the light they throw on the origin of the soldier's disability enables the Commissioners of Chelsea Hospital to decide on the amount of pension to which the man is entitled. Dr. Maclachlan, however, on whom the medical examination of the invalids devolves, states that an admission and discharge book, recording the nature of the patient's disease or injury, with a column for remarks, as to its cause and severity, would be sufficient for the purpose.

Q. 6069.
6076.

We find that in the Guards' hospital an admission and discharge book, having very much the character described by Dr. Maclachlan, is already in use, and with very little alteration might be adopted in all army hospitals; and in the interest of medical science we are of opinion that the registers or case books should be made the records of all important or remarkable cases, both as regards their symptoms and their treatment, and we attach value to the suggestion that extracts should be regularly made from these case books and published for the benefit of science in some civil or army medical journal. The publication would give a stimulus to the officers from whose case books the extracts were made, and the books themselves, carefully and scientifically kept, would afford to the Director-General one among other means of becoming acquainted with the degree of knowledge and attention brought to bear on this portion of his duties by each medical officer.

Q. 2884.
2897-8.

We recommend the adoption of a monthly diet table, by which the necessity of re-writing every day a nominal list of every patient in the hospital will be done away with. We should here observe that these changes and simplifications of forms are but specimens of what may be done by a careful revision of the whole, a work which we have neither the time nor the means to undertake; but we beg to suggest that all the regulations affecting the army medical service require revision, many having become inapplicable owing to the changes in the organization of the War Department, and from other causes. The sanitary directions contained in the regulations are also neither sufficiently numerous nor specific, and pre-suppose a much larger amount of practical sanitary knowledge than is usually possessed by most medical men, either in or out of the army.

Q. 2913-15.

Statistics.

Sir Alexander Tulloch in his evidence gives the following account of the origin of the inquiries on which were founded the statistical reports on the sickness, mortality, and invaliding of the troops, which have been periodically laid before Parliament:

"In October 1835, Lord Howick, then secretary-at-war, deemed it requisite that an inquiry should be instituted into the extent and causes of the sickness and mortality among the troops in the

6330.

West Indies, with the view of founding thereon such measures as might appear likely to diminish the great loss of life annually experienced in these colonies.

* * * * *

"Under these circumstances it became necessary to refer to a very voluminous series of returns and reports, containing an historical record of the medical transactions in the British army since 1816, first established by Sir James McGrigor, and extending over upwards of 160 folio volumes. For this duty Mr. Henry Marshall, deputy-inspector-general of hospitals, and myself, were nominated on the recommendation of the director-general, having been previously engaged in publications showing the extent of mortality among the troops in the colonies, collected from such limited sources of information as were within our reach. The documents submitted for our investigation consisted principally of a series of returns furnished annually by every medical officer in charge of troops on foreign stations.

* * * * *

"From these sources of information, a report was prepared showing the sickness, mortality, and prevailing diseases among the troops in the West Indies, from 1817 to 1834. On this report being submitted to the secretary-at-war in May 1836, he directed the investigation to be extended to the returns from each foreign station.

* * * * *

"When an opportunity was thus afforded of rendering the report so complete, the marked difference which had been observed in the course of the investigation, between the salubrity of different stations, though in the immediate vicinity of each other, also suggested the necessity for a more minute inquiry into the nature of the localities where the troops were posted, with the view of ascertaining to what agency that difference might be attributable. This ultimately led to the preparation of the topographical descriptions now prefixed to the details of each station, which were carefully compiled from the medical records, and such other sources of information as were attainable."

On Dr. Marshall's retirement, Dr. Balfour was associated, with Sir A. Tulloch, in the work, and has contributed to the preparation of all the subsequent reports.

The benefit accruing to the army from the compilation of these admirable reports has been very great.

The late Mr. Hume moved for their production in Parliament, and the interest excited by their publication strengthened the hands of the Secretary-at-War in his endeavours to move the troops from the unhealthy districts and insufficient barracks which they then occupied, in which he was ultimately completely successful. By these measures, without doubt, a large amount of sickness and consequent mortality was prevented.

Neither in the War Office, nor in the department of the Director-General is there, however, any statistical department for the reports to which we have alluded, and to the great value of which we have borne testimony, and the country is indebted for them to the voluntary exertions of two gentlemen, one of whom is the Superintendent of Pensioners, and the other the medical officer to the Royal Military Asylum at Chelsea.

Neither are the returns from which the reports are compiled so organized as to afford reasonable facilities for the collection of accurate statistics, whether for the purpose of registration or for the advancement of medical science.

Owing to the non-existence of any officer on whom such duties should specially devolve, the returns of sickness and mortality during the war in the East became involved in apparently inextricable confusion. The difference between the returns of deaths given by the principal medical officer, and the burial returns at Scutari alone, amounted to no less than 280 deaths in three months. There should be a registrar at the hospitals at the base of operations, whose returns would check and supply the deficiencies in the regimental returns made up at the front.

According to the method adopted in making up the weekly states in the Crimea, the Commander of the Forces could not, without an intricate calculation, obtain an adequate idea of the amount, progress, and nature of the disease and mortality in the army under his command.

To make the returns intelligible, and therefore useful, the mortality should be reduced to a recognized unit of time, and the rate of mortality per 1,000 per annum be invariably shown. The method, however, adopted in the Crimea was to state the per-centage of disease and deaths to strength at so much per week; but a mortality stated at 2·25 per cent. per week, as in January 1855, does not to inexperienced eyes appear very formidable, and certainly would not at once convey to the mind of the Commander of the Forces the terrible fact that at that rate in less than twelve months his whole force would be swept away.

The ultimate fate of an army frequently depends more on the intensity of its diseases and upon their causes than on their extent; and it is important that the Commander of the Forces should know what proportion of his disabled force is suffering from wounds and what from disease, and of the latter what proportion is attributable to that class of

maladies which experience has shown can be greatly diminished in severity by sanitary measures. For this purpose an improved classification of diseases should be adopted in the regimental "weekly states," whereby the zymotic diseases would be shown in a group by themselves; and every medical officer should be required, as is now sometimes done, to write upon the "state" the sanitary or other defects which in his opinion may have predisposed the men to such diseases.

It is true that these facts and conclusions can, with care and trouble, be worked out at home for the use of the authorities, provided the materials for the calculation are punctually transmitted to them. But for the purpose of informing the Commander of the Forces in the field, the return should be so drawn up as to convey to him at a glance the future prospects as well as the actual state of his army.

As therefore the main end of the compilation of statistics is to enable the military authorities to take immediate steps to correct obnoxious influences so soon as they are discovered, and to take measures to prevent the extension of disease and mortality, it is important that the transmission of the returns which we have described should not, when sickness breaks out, be delayed till the usual period for sending them to head quarters.

If, for example, from the unhealthiness of the locality, or the over-crowding of barracks, fever breaks out, or if from the monotony or improper composition of the ration, dysentery or scurvy appears, it is not sufficient to inform the authorities after the lapse of a few days that so many men have died, but immediate communication should be made in order that instant measures may be taken to provide the means of checking the disease, if they are not available on the spot.

In France, when an epidemic breaks out, the facts are noted day by day to the Conseil de Santé at Paris, who communicate them to the Minister of War.

Complaint has been made to us of the classification of diseases, which, being different from that used in civil life, and more especially from that of the Registrar-General, renders comparison with the mortality in civil life, if not less accurate, at any rate more difficult.

The nomenclature used in the army medical department is that of Cullen's nosology, which dates from the year 1780. Medical officers, however, are not entirely restricted to its use, nor debarred from adding in the returns the names of diseases not known to or recognized by Cullen; and a new nomenclature is contemplated by the Director-General in conjunction with a committee of the Royal College of Physicians.

Occasional inaccuracies also arise from the practice, generally though not invariably followed in the military hospitals, of making the diagnosis of the patient immediately on his admission. Should the medical officer afterwards have reason to think that he was mistaken, and that the patient is suffering from some other disease than that named in his original diagnosis, his only alternative, according to regulation, is to discharge the patient and re-admit him under a different head, or to treat him for one disease while his name is entered as suffering from another. In either case the return misleads the statistician, who enumerates two men with two diseases when only one man is in existence, or else disturbs the apparent relative proportion of the different diseases by which the army is affected by entering the case under the head of a disease which the patient never had.

In many cases this inaccuracy is avoided by delaying the diagnosis and placing the word "observatio" opposite the patient's name, which, though it may leave some diseases unspecified, still gives rise to no inaccuracy or mis-statement.

Dr. Farr, who is the head of the Statistical Department of the Registrar-General's office, informed us that the Registrar-General is anxious to incorporate with his periodical reports the mortality of the British army, so as to include in one view the deaths of all classes of Englishmen, whether at home or abroad, who have not, like emigrants or exiles, severed the tie which bound them to their own country.

The following extract from the Registrar-General's letter to the Secretary of State for War, dated February 1855, best explains the object contemplated:—

"My Lord, The 26th Section of 6 & 7 William 4. c. 86. provides for the registration of the deaths of British seamen, but no provision is made for recording in this department the deaths which occur in the British army abroad. I am aware that upon inquiry at the War Office relations may obtain information as to the last returns received respecting soldiers, but the enclosed forms show that few facilities are given to the public in making these inquiries, and that precautions are considered necessary to prevent unnecessary queries, and to limit the investigation to the nearest relatives or representatives of the party. It appears to me very desirable that in this central office, which contains the record of 20,000,000 deaths, marriages, and births which have occurred in England and Wales since 1836, a record should also be kept of the deaths of all soldiers who die

Q. 7089.

Q. 8980,
2905-12.

Q. 9546.

Q. 7102.

Q. 6342.

Q. 6343-4.

7105-11.

Q. 7043.

abroad. I am aware that it is far from desirable to make any addition to the numerous periodical returns made by all officers commanding regiments, and I am also aware of the difficulties in time of war of obtaining the exact information as to the date and cause of death, when so many die on board transports and in distant hospitals; but I submit to your lordship that these difficulties may be easily surmounted, and that it will be a great boon to the public if arrangements can be made that I be furnished as soon as possible with a nominal return for each regiment in Her Majesty's service, of every soldier whose death has taken place in 1854 arrangements being at the same time made that similar information should be sent to me in future, at such periods as may be considered best, either monthly, quarterly, or yearly. Here, that is, in the Registrar-General's office, the names would be indexed alphabetically, and information at once afforded to the public."

This proposal was made at a time of pressure, when it was difficult to entertain it, and no step has yet been taken to carry the suggestion into effect.

It is impossible, however, to deny that advantage would result from its adoption. The births and marriages taking place in each regiment should also be included in the returns transmitted. The War Office would be relieved from the correspondence entailed upon it by the frequent inquiries as to the date of death of deceased soldiers, inquiries which are not answered until the object of the questioner has been first ascertained.

Under the arrangement proposed by the Registrar-General, his would be the only office where such inquiries would be made, whether they referred to the deaths of soldiers or civilians.

The returns of deaths which are now received at the War Office would, if transmitted to the Registrar-General, be at once placed before the public in a popular and intelligible form. A comparison between the rates of mortality in military and in civil life would thus be easily and constantly made, and, what is equally important, a comparison of present with past rates would enable the Government and the public to judge whether the health of the army is improving, and the rates of mortality diminishing, or the reverse.

Without some publicity, we fear that this subject, important as it is, may again fall into oblivion and neglect, and the evils which we have described continue unnoticed and unremedied.

The publication of the statistics of mortality of the troops in the West Indies enabled the Secretary-at-War to grapple with the evil, and apply a remedy.

Q. 8981.

It is desirable to ensure to the troops at home the advantage of the same publicity, in order to secure the adoption of the measures necessary to relieve them from the continued influence of conditions deleterious to health and life.

For this purpose, the statistics of the army should be so kept as to enable the Government to judge of the comparative healthiness of every station, and every barrack; to trace sickness and mortality to their various causes, to ascertain the comparative influence of each, and to take the precautions and apply the remedies which the case may require.

An efficient statistical staff must therefore be formed, directed by a person versed in work of that description, and who will bring to bear on the subject medical, sanitary, and statistical knowledge. Such a staff ought, in our opinion, to form part of the Army Medical Department.

We should state that the household cavalry do not furnish returns to the Director-General as do the rest of the army. Being desirous of obtaining certain information regarding the extent and causes of sickness among these troops, we applied to the commanding officers for returns, but were informed that no documents exist from which they could be prepared, except in the 2nd Life Guards, who furnished the returns required.

It is as important to the household cavalry as to any other corps that their rates of sickness and mortality should be accurately known, with a view to the adoption of the measures necessary to ensure their health, and we recommend that they should in future be required to furnish, to the Army Medical Department, returns of sickness and mortality as is done by the rest of the army.

We recommend, that a nominal list of the deceased soldiers and of births and marriages in the army abroad be communicated to the Registrar-general at such periods and in such a shape as may be necessary for the object in view.

That an improved nomenclature of diseases be adopted in the Army Medical Returns, and such alterations in the classification as may admit of an accurate comparison with other returns of a similar nature; and that provision be made for the periodical publication of the statistics of sickness and mortality among the troops at home and abroad.

That forms be prepared for the use of the medical officers, which shall enable the Commander of the Forces in the field to know what is the past and existing rate of sickness and mortality in his army, what are the causes of it, and for what time at a continuance of the same rate and with what reinforcements he can maintain his army in the field. These forms should besides enable the home authorities to compare the rates of the army with those of civil life and with its own rates at previous periods.

That the household brigade be required to furnish the same returns of sickness and mortality as the rest of the army.

For the attainment of these objects we recommend the formation of a statistical branch in the Army Medical Department.

Invaliding.

In obedience to our instructions we inquired into the measures taken for invaliding and awarding pensions. This duty is discharged by the Commissioners of Chelsea Hospital, who consist of the Governor and Lieutenant-governor of the hospital, the President of the Council, the First Commissioner of the Treasury, the four Secretaries of State, the Paymaster-general, the Adjutant-general, the Quartermaster-general, and the permanent Under Secretary-at-War; the Paymaster-general being always the president.

Q. 5985.

Formerly the invalids were all brought up to Chelsea to be examined, and being billeted in low public-houses, suffered much from consequent intemperance and debauchery. This practice was abolished by Lord Howick, and none but the household troops now attend at Chelsea to be invalided, which they are enabled to do without inconvenience from the barracks where they are quartered. The invalids from line regiments in England are examined at Chatham, and those in Ireland at Kilmainham, whence their papers are forwarded, with a recommendation on each case, to the Commissioners at Chelsea, who decide on the amount of pension to which each man is entitled.

Q. 5993.

Q. 5992.

Q. 5994.

Q. 5998.

Q. 5999.

The artillery invalids are examined at Woolwich.

Men invalided in the colonies and intending to settle there have their papers forwarded to Chelsea, their attendance in England being dispensed with by order of the Secretary-of-State for War.

Q. 5996.

The examination in England is conducted by Mr. Moorhead, secretary to the Commissioners, and by Dr. Maclachlan, who proceed to Chatham and Woolwich for the purpose. The men receive twenty days' pay for their subsistence during the interval between their discharge and the awarding of their pension, and a free passage to their homes. The average number of men invalided during the ten years preceding the war was 4,000 per annum, last year the number was 8,943.

Q. 6002.

Q. 6004.

The in-pensioners of Chelsea hospital are selected from such of the out-pensioners as apply for admission. The annual vacancies in the hospital are about sixty, and the number of candidates on the list are usually about three times the number of vacancies. Those men are selected who appear most deserving in point of character, and to whom, from the nature of their infirmities, residence in the hospital would be the greatest boon.

Q. 6025.

Q. 6026-7.

Q. 6029-31.

Mr. Moorhead states, that some expense and inconvenience would be saved, if the attendance of the men who claim pension not for disability but for length of service were dispensed with. No personal examination of the man is necessary in those cases, and when discharged he might proceed direct home from the quarters of his regiment and be spared the intervening journey to and from Chatham.

Q. 6048.

Mr. Moorhead further states, that the pension warrant of 1829 enjoined upon commanding officers an accurate statement of the causes of accidents, but, the injunction having been omitted in the Warrant of 1848, many officers have imagined that it is not required, and the difficulty of deciding upon the cases has been thereby increased.

Q. 6050.

Q. 6052.

Dr. Maclachlan states, that practically his functions are confined to examining the man in order to advise the Commissioners as to the value of his disability, with a view to pension. Although authorized by his instructions he exercises no veto on the retention or the discharge of the man from the service, which is decided by the Principal Medical Officer at Chatham.

Q. 6060.

Q. 6063.

Dr. Maclachlan considers that the duties would be much facilitated were an admission and discharge book kept in every hospital on the model of the one we have already recommended for adoption, and which is to be found in the Appendix.

Q. 6073.

Q. 6102-3.

He also suggests, that the attendance of men with palpable disability, such as loss of a limb, might be dispensed with advantageously both to the public and the invalid, who is now exposed to a long and unnecessary journey.

App. lxxiv.

Q. 6112.

The duty which is in the hands of two able officers, appears to be well conducted, though it may admit of question whether the Principal Medical Officers at Chatham and Woolwich, who have already for the purpose of discharge submitted the invalid to

the strictest examination, could not perform all the duty now executed by Dr. Maclachlan, and relieve that officer from the necessity of making fortnightly journeys to Chatham, which will of course become longer and more expensive when the invaliding establishment shall be removed to Netley.

Q. 6038. Mr. Moorhead makes some suggestions as to the rates of some classes of pension, which do not come within the scope of our inquiry, but which are worthy of attention, though the alterations proposed are slight, and are, financially, unimportant.

We have, therefore, only to recommend that men claiming pension not for disability but for length of service, and men labouring under palpable disability, be no longer required to attend at Chatham.

And that the attention of commanding officers be drawn to the necessity of carefully recording the causes of any injury or disease from which men may suffer, and which may ultimately affect the amount of pension to be awarded to them.

Education of the Army Medical Officer.

The education of the army medical officer, both before and after he has received his commission, occupied much of our attention.

The existing practice is described in the following words by Dr. Andrew Smith, the Director-General of the Army Medical Department, and a member of the Commission :

Q. 2. "Any gentleman who is desirous to obtain an appointment in the Medical Department of the Army makes known his wish either to the Commander-in-Chief or to the Director-General of the Medical Department, — generally to the latter. On the receipt of such communication, a schedule is forwarded to the applicant by the Director-General, with instructions to enter in it a statement of his professional education, acquirements, testimonials, &c., and to return it to the Office of the Army Medical Department. If the candidate has had the education required, and is in possession of a diploma in surgery, either of the Royal College of Surgeons of England, Dublin, or Edinburgh, or of the Faculty of Physicians and Surgeons of Glasgow, or of Trinity College, Dublin; and if some person of standing in society, not of his own family, certifies to his respectability, and to his steady and regular habits, then his name is recorded as a candidate, and he is informed that his wish will be considered as opportunities arise. If on the contrary the returned schedule does not show him to have the required qualifications, he is told so; his deficiencies are specified, and he is informed that in the event of his afterwards attaining what is wanting he may report to that effect should he still desire an appointment. If the examination of the certificates which he is required to produce prove satisfactory, he is then subjected to a professional examination by a Board composed of myself and two senior officers, and if the replies given to questions put verbally and in writing prove him to be well qualified to discharge the duties which are required of an army medical officer, he is then selected for temporary service in the General Hospital at Chatham.

App. No. 1. "All candidates who do not come up to the required standard are rejected; the rejections are from two to three annually, and are generally in consequence of defective information in regard of Latin, or of subjects on which some of the Colleges do not or did not examine. Up to the commencement of the late war every possible effort was made to secure eligible candidates, and many of the public schools were entrusted with the power of recommending one or two yearly for commissions, provided they did so after having subjected those who desire them to a competitive examination. This plan was carried on with advantage to the public service, by the College of Surgeons of Edinburgh, but not to the same extent by any of the other professional bodies, and through the intervention of the former College some of our very best recruits were obtained. I extended it myself considerably when I came to be the head of the department, and I offered further opportunities to these public bodies to send the names of men who might compete. Since the termination of the war, a competitive examination has been introduced as a rule of the service, and no commissions have since been granted but to men who have been selected after such a test.

Q. 4. "At Chatham his capabilities are further tested by placing him in charge of sick, under the superintendence and direction of a superior medical officer; and he is from time to time reported upon by the principal medical officer of the establishment, and the staff surgeon of the division in which he serves; if these reports are in his favour, he is when senior recommended to fill any vacancy which may occur, and he is gazetted to a commission in the service. During this probationary period he is required to show his knowledge of disease and its treatment, his efficiency as an operator on the dead body, his aptitude for describing disease, as ascertained through the medium of periodical reports on the cases he may have treated; and he is required to become acquainted with the regulations of the service, and the compiling of returns, more especially those which are required from regimental medical officers. Each candidate at Chatham takes it in turn to make post-mortem examinations. All the medical officers of the establishment are assembled in the dead-house, and one makes the post-mortem examination, while another records what the operator observes. The gentleman who is appointed specially to superintend the pathological branch of the establishment watches how he describes, in order to see that he reports correctly. If he does not describe the appearances correctly, he is immediately stopped, and his attention is called to the points which he may either have overlooked or have improperly stated, and he is made to go over the parts again until he states them correctly; candidates are also instructed in the application of splints and bandages on a stuffed figure, in order that they shall understand exactly how to act upon the living body. These are the principal instructions which he receives while at Chatham; and upon his efficiency in doing all these things depends his appointment, as I am made aware of the efficiency of every man by the reports from the principal medical officer."

Q. 2.

In answer to a question whether these candidates were often rejected after their probation at Chatham, the Director-General states that they have been pretty well tested before they go there, and rarely turn out inefficient. Formerly, during the time that the candidates were awaiting their commissions at Chatham, they were required to support themselves, so that a great part of the professional duty in the hospital was discharged by unpaid persons, till the Government, at the instance of Dr. A. Smith, then principal medical officer at Chatham, consented to grant to each of the three seniors six shillings a day, and the allowances of an assistant-surgeon. Q. 4.

It appears to us that considerable improvement might be effected, both in regard to the qualifications required of the candidate before he can be examined, and the mode of conducting the examination. A diploma of the London College of Surgeons, or that obtained at Dublin, Edinburgh, or Glasgow, is required indiscriminately of every candidate, and is taken as *primâ facie* evidence of his having had a fair professional education; but the diploma obtained at Dublin, Edinburgh, or Glasgow is a guarantee of a wider field of attainment than that of the London College. The former includes materia medica, chemistry, and the practice of physic, while the latter is confined to surgery alone. But the examination instituted at the Army Medical Department recognizes no difference in the candidates who bring certificates of surgical and medical knowledge, and those who bring evidence of surgical study alone. The same questions are put to all, and the practice is justified on the ground that nothing is taken for granted, but that the examination embraces all the subjects in question, whether the candidate brings his diploma from the one place of study or the other. If this view be a sound one, it seems to follow that the surgical diploma could as well be dispensed with as the medical. Either a diploma has a certain value as a test of attainment, or at any rate as a test of education, or it has not. If the latter, the exaction of it in any case is unnecessary; if the former, it seems to us objectionable that it should be exacted for one branch of the profession and not for the other, and that other the most important, inasmuch as the majority of serious cases treated in military hospitals, whether in peace or war, are medical rather than surgical. Q. 26-31. Q. 2482-5. Q. 954, 955, 1030. Q. 2452, 9124. Q. 2802, 2803.

In either case the present practice leaves the proficiency and capacity of a large proportion of the candidates to be tested by the single examination at the Army Medical Department, which makes it the more important that that examination shall be as searching and effective as it can be made, shall be carried on by examiners the most fitted by their previous practice for duties of so special and important a character, and shall be conducted in such a manner as to inspire the greatest confidence as regards both the equality of the standard of the examination upon each occasion, and its sufficiency to test not only the memory, but the ability of the candidate.

To make the examination effective for its purposes, the examiners must be men thoroughly practised in their duty, and, if possible, teachers. On this point we quote the authority of Sir B. Brodie, who says,—

“There is a great art in examining; and the great thing, so far as I have seen, for a good examination is to get a good examiner. A man practised in examining would be a better examiner than one who is not practised. Q. 520.

“At our College of Surgeons I do not find a man become a very good examiner under two or three years. I think the teachers are the best examiners. They know most about pupils. It is difficult to get good examiners who are not teachers. A man conversant with teaching and knowing the habits of pupils generally makes out in a quarter of an hour what a man is worth. If he is not so conversant, it takes him a long time to do so.” Q. 522.

It is obvious that though there are in the Army Medical Department many men whose ability and attainments are beyond dispute, yet the same rule applies to them as to civil medical men, namely, that examining is an art requiring constant practice; and that, unless he is likewise a teacher, the examiner is seldom perfectly efficient. It will not be out of place to add that the Director-General states that the time which is required when the examinations are competitive cannot be spared in his office; and that if such examinations are to be continued, he will be constrained to represent to Lord Panmure the necessity of employing other officers. Q. 2458, 2798. Q. 85.

The East India Company has entrusted the examination of the candidates for its Medical Service to a body of examiners unconnected with the department into which the candidate seeks to be admitted. This system has now been in operation for nearly three years. The examination, like that in the office of the Army Medical Department, is competitive, the vacancies being filled by such of the candidates as pass the best examination, but none are admitted who do not show themselves superior to an absolute minimum standard of attainment or capacity. Q. 672. Q. 697.

- Q. 679. The examination is thus described by Mr. Paget, F.R.S., assistant-surgeon of St. Bartholomew's Hospital, and one of the examiners of the East India Company. It lasts for five whole days, and is conducted by four examiners, each examiner setting the questions on his own subject at each examination. The subjects of examination are anatomy, physiology, comparative anatomy, medicine, surgery, and natural history. The examination is conducted partly orally and partly by written questions. But the main difference between this examination and that of the Army Medical Department is, that there is, in the first instance, a practical examination of every candidate, partly by the observation of patients at the bed-side, and written reports of their cases, and partly by operations on the dead body, and the application of splints and bandages, &c. It is obvious that an examination so conducted affords better means of judging the practical competency of the candidate than the mere enumeration orally or on paper of symptoms, from which his knowledge of books would enable him at once to name the disease, or describe the necessary treatment, but which symptoms he would be unable himself to detect in the patient submitted to his observation. Dr. Parkes and Mr. Paget, both being examiners for the East India Company, state that the effect of the competitive examination has been to raise considerably the general attainments of the candidates. The results of the examination show more practical knowledge derived from observation and less cramming derived from books. Dr. Parkes states that "at the first examination, though there were some extremely good men, the bulk of them did not come quite up to his expectation; but that at the last examination, where there was the large number of forty-six, there were some extremely good men, all the twenty-two that were chosen being very valuable public servants." The pay and allowances of the East India Company being on a higher scale than those of the Queen's Service, no doubt attract a better class of candidates than the latter commands; but the appearance of men with a higher standard of attainments as candidates for the same service at the later examinations as compared with the earlier, the conditions as to emolument remaining unchanged in the interval, shows, as has been found in other departments, that if the examination be efficiently conducted, its increased severity, so far from deterring, seems rather to attract not only more numerous, but also better qualified candidates.
- Q. 674. Q. 676. Q. 2456. Q. 685, 694, 695. Q. 761.

The only objection which can possibly be advanced against the adoption for the army medical service of an examination such as we have described, and conducted by a board of examiners constituted like that employed by the East India Company, which comprises some of the most eminent of the teachers at the great London hospitals, is, that gentlemen who have themselves been wholly educated in civil hospitals, and whose studies and practice have been wholly civil, cannot have the peculiar knowledge or experience which would enable them to examine in the specialties of the military Medical Service.

- Q. 67. Q. 71. Q. 523-5. Q. 766. Q. 2804. Q. 72, 122, 629-631.
- The Director-General gives it, however, as his decided opinion, in which he is supported by every medical practitioner, whether military or civil, who gave evidence before the Commission, that such special instruction can be far better given after than before the examination on first admission. The present practice is to allow candidates who have studied at Dublin or Edinburgh, at which places there are endowed chairs of military surgery, to substitute, in their return of the lectures they have attended, a course of military surgery for one of general surgery. But neither Edinburgh nor Dublin presents any peculiar facilities for illustrating the teaching of the specialties of military medical practice. In the former the garrison is very small; in the latter the regimental hospitals present only the ordinary military cases, which differ in no way from those in civil life; the lectures on military surgery can therefore only be theoretical, and tend to draw away the attention from that complete course of general surgical and medical study which must form the basis of that professional knowledge, which is equally necessary to the military as to the civil practitioner, and which the former has but little opportunity of acquiring after he has once joined his regiment.

- Q. 66.
- The result appears to be, that the knowledge of military surgery acquired by the student who attends this course is but theoretical, and therefore of little subsequent utility while it is often acquired to the exclusion of less special, but far more important, because more indispensable knowledge. So little is the value attached by the Army Medical Department to this course, that no deviation from the ordinary subsequent instruction at Chatham is made in favour of those who have passed through it; but all are alike subjected to the same process of instruction in the specialties of military practice, so far as time and the opportunities afforded at the invalid hospital at Fort Pitt will allow.

As no professorship of military surgery exists in London or at Glasgow, the advantages of the existing chairs are at best but partial, being limited to the students of Dublin and Edinburgh. This inequality of opportunity for acquiring special

knowledge, whatever may be the merits of the course, is in itself an evil which requires to be remedied. Either the system should be extended or abolished. If a course of military surgery before the examination for admission to the service be a benefit, similar chairs should be endowed by the Government in London, and at other towns where good medical schools exist. If, on the other hand, the specialties of military hygiene can be better acquired afterwards, then these endowed chairs should be transferred to some locality where all can alike share in the advantages to be derived from them. Q. 9135.

Upon this alteration there is a concurrence of opinion among all the physicians and surgeons, whether civil or military, whose evidence was taken by the Commission. The opinion of the Director-General has already been quoted. Sir B. Brodie considers that a course of military hygiene relating to special matters connected with the military profession would be much better pursued in a military than in any civil hospital, whether in London, Edinburgh, or Dublin. Mr. Fergusson even considers the present practice at Edinburgh to have been injurious, military surgery having been accepted as a substitute for one of the courses of ordinary surgery. We have no hesitation in adopting an opinion which common sense seems to recommend, and which is supported by so great a weight of authority. Q. 516, 517.

Laying down, therefore, the principle that the soldier must be treated for the same diseases in the same manner, whether medically or surgically, as the civilian, our object is in the first place to secure that the candidate shall have had the best instruction which can be got in the only practical schools for this purpose to which he can have had access, namely, the civil hospitals; and it is the more important that he should be at first thoroughly grounded in all branches of civil surgery and medicine, including midwifery, inasmuch as the peculiarities of the service he is about to enter will, probably, during a large portion of his after life debar him from any return to studies in civil hospitals; whereas in military hospitals he will be able to acquire that knowledge of the specialties of military practice which the civil hospitals give him no opportunities of studying. In our opinion, therefore, any time withdrawn at the period of the medical student's career from the subjects taught in civil hospitals, for the sake of acquiring knowledge which can only be obtained out of them, is time mis-spent. Q. 629-631.

If, however, we exclude military hygiene from those subjects, a knowledge of which is to be required of the candidate for the army medical service, it is not that we underrate its value, or have any intention of leaving the medical officer to pick it up by his own unassisted observation, according as his opportunities and his industry may or may not enable him to do so. On the contrary, the importance of such knowledge cannot be too highly estimated. The term military hygiene is but another name for sanitary science; but it is sanitary science applied to the prevention of disease and mortality under conditions far more varied, more threatening to health, and, above all, more sudden and novel in their character, than those which usually affect the health of men engaged in the ordinary avocations of civil life. Q. 629, 630.

As Sir George Ballingall truly says, in a published letter to the late Sir Robert Peel, "It cannot be too often repeated, that it is by prevention rather than by cure that the efficiency of our fleets and armies is to be maintained." But it is prevention under circumstances of the greatest difficulty. The congregation of large masses of men together almost invariably generates disease in some form; but if, in addition to the danger so incurred even under ordinary circumstances, the physical powers are taxed to the utmost, and exhausted by unusual fatigue, while the ordinary means of repose and restoration are of necessity withdrawn, and risk by exposure to wet and cold is super-added, not only are the greatest vigilance and fertility of resource indispensable to combat dangers so formidable, but a thorough knowledge is also required of their causes, and of the means which have been already used with success to avert or overcome them. The medical officer should therefore not only be thoroughly conversant with sanitary science, but with the mode of its application to the preservation of health under every possible variety of circumstance and character. Unless he have the benefit of the experience of others, his knowledge may come too late, and may itself have been acquired at the expense of those whose lives have been entrusted to his charge. It is in a military hospital alone, and from professors specially qualified to communicate it, that the probationer can acquire the knowledge which is indispensable to the proper exercise of his profession in the army.

The habits and temper of the soldier are formed by the peculiar life which he leads, and the discipline to which he is subjected must be thoroughly understood by the medical officer.

The treatment of tropical and other diseases to which Your Majesty's troops, serving in succession in every quarter of the globe, are peculiarly liable, and with the form and

character of which the practitioner in civil life in England has little opportunity of becoming acquainted, can only be seen in any numbers, and then generally in a chronic state, in the military hospitals to which the invalid soldier is brought for observation previous to his discharge from the army.

Q. 9130-1. We are therefore of opinion that, after his examination for admission is passed, the candidate should be sent for a limited period as a probationer to the chief general hospital of the British army at home, there to become familiarized with the system and discipline of the army, and to be instructed in the specialties of military hygiene.

Q. 2.
Q. 2230-1. This, as will be seen by the evidence of the Director-General, is already partially done at the invalid hospital at Fort Pitt; but the stay of the probationers there has now no reference to the amount of proficiency they may have attained, nor even to the amount of opportunity afforded to them for obtaining it, but is regulated solely by the existence or non existence of vacancies in regiments or on the staff.

Neither are there any permanent professors or instructors at Chatham, with the exception of the curator of the admirable museum at Fort Pitt, who superintends the pathological studies of the probationers. There is no lecturer on sanitary science, nor is any clinical instruction given by the bedside of the invalids. Nor is there any manual of sanitary science for the guidance and instruction of the young medical officer entering the service.

Q. 74.
Q. 75. The hospital, in course of construction at Netley, is intended to receive all cases sent from foreign stations, or from the troops at home, for the purpose of being invalided or discharged for disability from the service. The whole medical staff which now conducts the invaliding at Chatham will then be transferred to Netley. The museum now at Fort Pitt will likewise be moved there, and it is contemplated to have models of ambulances, hospitals, barracks, and all the appliances necessary for a military medical school.

The only objection to this plan which suggests itself to us is, that the medical experience of the general hospital at Netley will be confined for the most part to chronic diseases. The site of the hospital being far from any existing garrison, comparatively few acute cases will pass through it. If a soldier fall sick at Chatham, Aldershot, or Portsmouth, in which places he can at once be treated on the spot, it would be unjustifiable to subject him to a railway journey for the sole purpose of giving additional opportunities of study to the medical officers at Netley.

. 2467-8. Still, for the purpose of teaching military hygiene, and that branch of medicine which comprises the treatment of tropical diseases, it is stated that those chronic cases returned from abroad will be more useful than acute cases of ordinary disease contracted in England could be, inasmuch as they show results of tropical diseases which the clinical lecturer would trace back to their causes, and, by describing their original features, enable the student to recognize and deal with them whenever he may meet with them in his subsequent practice. There is no doubt that, for the disembarkation and reception of invalids, Netley possesses, from its situation on the sea beach, a great advantage over Chatham; but the number of invalids from abroad in hospital varies very much, and there may sometimes be scarcely so many patients in Netley as would be desirable for the purposes of instruction and study. Though for these reasons there are disadvantages in the position of the new hospital at Netley, as regards its distance from any great garrison, we think that it is the hospital which will afford the best opportunities for instructing young men in the specialties of military medical practice.

Q. 2805.
2806.
2134. We propose, then, that the two chairs of military surgery now in Dublin and Edinburgh, should be transferred to the chief military hospital in England, dividing, however, the subjects of instruction between the professors; say one giving instruction in clinical and military medicine; the other in clinical and military surgery; a third professor being added to give instruction in sanitary science and military hygiene.

Q. 2465. These three professors should be permanently attached to the Institution, and should be selected, not for their experience or attainments alone, but for their special aptitude for the peculiar and important duties which they will have to perform,—duties so important, that the field for their selection should not, in our opinion, be narrowed, at any rate at first, to any one branch of the medical profession.

Q. 68. The Director-General recommends that the probationer should attend the courses of instruction of these professors for twelve months. Other witnesses have suggested six, but, as the departure of the probationer after the completion of his course depends entirely on the number of vacancies that may exist in regiments, or on the staff, there will be a further interval, varying in duration, between his examination in military hygiene on the expiration of his term of probation and his appointment to the service. We are of opinion, therefore, that a minimum of six months will be enough to exact of the proba-

tioner, after which period, provided his final examination for his commission be successfully passed, his continuance or removal will depend, as now, on the exigencies of the service.

An assistant-surgeon, after serving five years, becomes eligible for the rank of surgeon, which rank is attained on an average after ten or twelve years' service.

Formerly promotion to the rank of surgeon depended on the passing of a second examination, with a view to ascertain whether the assistant-surgeon had attained a certain standard of proficiency. This examination appears to have been discontinued owing to its unpopularity among those to be subjected to it, and who considered it derogatory to men of their standing. We are not disposed to attach much weight to this objection, dating back, as it does, to a period since which the altered tone of public feeling on the subject of examinations induces men, even of very high attainments, to submit themselves to the ordeal without a thought that they are in any way compromised by the proceeding. It is stated to us that the examinations of members of the College of Surgeons for the fellowship of that body attract more and better educated candidates than they did some years ago, and amongst them are persons who have for the most part reached a more advanced age than that at which assistant-surgeons would be required to pass for surgeoncies. It is possible, too, that an examination conducted by any three officers at different stations all over the world, may, by the apparent inequality of its results, have destroyed confidence in the practice. A more serious objection is to be found in the inequality of the opportunities of study and improvement enjoyed by the assistant-surgeon according to the station at which his regiment may be quartered.

It appears to us, however, that great advantage may be derived from an examination testing the practical knowledge of his profession which the assistant-surgeon may have acquired. In this opinion we are confirmed by the evidence of several of the witnesses who were examined before us. Sir B. Brodie, Mr. Fergusson, Mr. Paget, Dr. Parkes, and Mr. Alexander, all concurred in the advisability of an examination before promotion, if the practical difficulties to which we have adverted can be overcome. Not only, in our opinion, would it be valuable as a test of the use which a young medical officer has made of the opportunities afforded him since he received his first commission, but it would operate from the moment he joins as a strong inducement to study at a time when the tone and amusements of young officers, with whom he for the first time associates, offer the greatest temptation to idleness and dissipation, and when habits are formed which probably colour his whole after career.

It has been found by experience at the Universities that the sense of an impending examination is in young men of average character the best security for attention to study at their first entrance.

After considering the difficulties in the way of the institution of the proposed examination; we have come to the conclusion that they are not insuperable.

In the navy, where a second examination has always been exacted before promotion, the practice is said to have worked well. Possibly the fact that the combatant officers in that service are likewise subjected to an examination, and that a severe one, before they can obtain their lieutenantcy (the lieutenant ranking with a captain in the army), may have prevented their examination from being looked upon as derogatory by the naval assistant-surgeons. The combatant officers, too, are subjected to the same examination, whether they have had the advantage of serving in a vessel entitled by her rating to bear a naval instructor or not, though their facilities for preparation must in the two cases have been very different.

The naval assistant-surgeon is eligible for promotion, and therefore for examination, after three years' service in his rank. In the case of officers on a foreign station there is a local examination, after which they can be promoted subject to passing the final examination at home, when the promotion is confirmed, and ante-dated. The candidate is required, before undergoing the examination at home, to produce a certificate of attendance at a dissecting school where he shall have performed all the operations. If the candidate fails, as he sometimes does, he is remanded for another examination.

The occasional failure establishes the value of the test. The naval examination differs, however, in character from that which would be applicable to the army.

The naval assistant-surgeon occupies a different position, as regards his duties, from the army officer of the same rank. Except when detached or having a separate charge, he neither operates nor prescribes, unless under the actual supervision of the surgeon. He is more in the position of a student and less in that of a practitioner than the army assistant-surgeon, a difference, perhaps, in part originating in the necessity he is under of getting used to the sea and sea habits before he is able to exercise his profession. On the other hand, the sailor is exposed to few of the vicissitudes from which

the soldier, whether in camp or in bivouac, suffers so much in war, but carries about with him in every part of the world and under all circumstances his barrack, his hospital, and every comfort to which he is accustomed in peace; naval hygiene is consequently a very different science from that to which the term "military hygiene" is usually applied.

The naval examination being chiefly, though not exclusively, directed to matters in which the candidate can have had little practice, especially on board small ships, namely, to operative surgery, it becomes necessary that he should be brought home to prepare himself in the anatomical schools for the examination which he is to undergo, which does not comprise subjects relating to hygiene. In these the army surgeon has better opportunities while on service of perfecting himself by practical observation than are offered to him at home. All the witnesses concur in the opinion that in the army the examination of the assistant-surgeon for promotion should be directed to the practical knowledge of his profession as a military medical officer. By the simultaneous issue to every station of sealed examination papers, to be opened and answered in writing in the presence of some chief authority, who will take due precaution for the non-evasion of the conditions, an identical and therefore equal examination will be secured to every candidate.

But if this mode of examination be thought insufficient, and it be held that some oral or practical examination at home is requisite, the opportunity of obtaining that would not be wanting, even in the case of officers on distant stations, if more frequent leave of absence for the purpose of study be granted to medical officers. In the navy, the medical officer has, at intervals of three, four, or five years, when his ship returns from a station, the opportunity of revisiting the hospitals and renewing his studies if he be so inclined.

The want of such leave is now felt as a disadvantage by the army medical officer, and is given by a witness as one reason why the medical service of the Oriental and Peninsular Company is preferred to that of the Crown. It has been suggested, that after a certain service so many weeks' leave should be granted for every year served abroad, on condition that during such leave the officer attend some medical school, either in a civil or military hospital, of which attendance a certificate would be demanded; and it is stated that many officers would gladly take advantage of such opportunities of improving themselves.

Without laying down any precise rules by which this roster for leave should be governed, we see much advantage in the proposal on its own merits, besides the additional facility which it offers for conducting the examination for promotion to which we attach much importance.

Looking at the want of variety incidental to the medical care of a small detachment, or even of a service battalion of 600 men in a healthy station, which offers but little to the observation of the medical officer beyond the ordinary diseases to which most adults between the ages of 18 and 35 are liable, we think that no opportunity of keeping up or adding to his professional knowledge should be neglected, and we consider that the army medical officer should therefore be permitted to take private practice whenever it can be obtained. The rules of the service are stringent enough to ensure attention to his military duties; and the stay of his regiment at each station is so short that it is not likely that he will be able to obtain, in competition with permanent resident practitioners, a practice so extensive as to absorb too large a portion of his time. On the other hand, the greatest practice makes the best men, by utilising the highest theoretical attainments, and the military patients will reap the full benefit of the skill and science which the army medical officer will have attained in the course of his private practice.

As regards, therefore, the qualifications to be required of the candidates previous to examination, we recommend, that in all cases such certificate as would qualify a civilian to practise medicine as well as surgery should be exacted of the candidate.

We think that the examination should comprise some test of general education. Sir B. Brodie attaches great importance to habits of mind created by a liberal education, which will enable a young man, when he enters the profession, to make everything out for himself better than others can make it out for him. In the words of another witness, he will have learned how to learn.

It will be wise, as in the case of every new requirement in an examination, not to exact too high a standard in the first instance. With time the general education of the candidates will rise, and the standard of examination will rise with it. A striking illustration of this position is to be found in the experience of the College of Surgeons, of London, which a few years ago for the first time introduced this element into the examination for Fellowships, and latterly, though after a long interval, with complete

success. On the other hand we are of opinion, for reasons which we have already given, that no acquaintance with the specialties of military medical and surgical practice and hygiene should be required of the candidates, but that such knowledge shall be supplied after the first examination and previous to final admission into the service.

We further recommend, as regards both surgical and medical knowledge, the addition of a practical to a theoretical examination. Q. 2456.

We recommend that this examination be competitive and be entrusted to a body of practised examiners, as is now done by the East India Company, and we think it desirable that, if possible, one and the same board should conduct the examinations for the medical service of the East India Company, the Army, and the Navy, to which arrangement we apprehend no insuperable difficulty.

We recommend that after the first examination the candidates be sent to a military general hospital, there to go through a course of instruction in military hygiene, and in clinical military medicine and surgery, for which purpose the necessary professorial chairs, in lieu of the two now existing in Edinburgh and Dublin, should be instituted at the principal general hospital in England.

That during their residence at such general hospital all the probationers be accommodated with quarters, and shall receive such a rate of pay as may be sufficient for their subsistence.

That the course be not less than six months previous to examination on the subjects of the course, on passing which the probationers shall be eligible for appointments, as assistant-surgeons, and that, if possible, the first appointment be to a regiment. Q. 2320-25.

That an examination in the practical knowledge of his profession as a military medical officer be passed by the assistant-surgeon before promotion to a surgeoncy.

That leave of absence be granted for attendance at hospitals and medical schools; and,

That medical officers be permitted to take private practice under such regulations as may ensure attention to their military duties.

Pay and Retirement.

By the alterations we have recommended in the system of examination by which that a candidates are to be admitted to the Army Medical Department, it is obvious higher standard of professional education will be demanded of our medical officers than has hitherto been required. At the same time, we are proposing to entrust to them more onerous duties, and to fix upon them heavier responsibilities than devolve on their professional brethren in civil life.

It becomes, therefore, most important that the conditions of the Queen's Service should be such as will attract to its ranks a due proportion of the ablest medical students, and offer such encouragement to knowledge and skill as may induce the successful candidates to devote all their energies to the study of their profession, since the whole medical staff must, in future, occupy a higher position in the organization, and exercise a wider influence in the administration of the British army than it has ever yet done.

The question then naturally arises whether the pay given, the honours bestowed, and the position awarded to the army medical officers are such as to attract to the ranks of the Army Medical Department a fair share of the best men who devote themselves to the medical profession. Q. 8635.

Upon this point we are enabled to adduce some strong, and at the same time impartial evidence, from witnesses of no ordinary authority on such a subject. Sir Benjamin Brodie being asked whether, in his opinion, the pay, the rank, the emoluments, and the general position of an army medical officer are such as to attract to the army medical profession the best students, or a fair share of them, answers:— Q. 542.

"I can only say that I do not believe that I have ever recommended any of our better class of students at St. George's hospital to go into the army, except into the Guards, where they have some advantages which they do not possess elsewhere. I do not think that there is anything in the army, as it now exists, to remunerate the better educated class of students."

Mr. Fergusson, in answer to a similar question, gives it as his opinion that though some first-rate men do enter the Army Medical Department now and then, as a rule the better men do not. This he attributes to the— Q. 642-5.

"Insufficient inducements that are held out by pay and rewards for good conduct, and he does not now advise the best men to enter the military or the naval medical service."

He adds that,—

"If greater inducements were held out, undoubtedly good men would enter; they would be advised to do so by their friends and by those who are judges."

Appendix xiv.

Strong testimony to the same effect is contained in a correspondence, a copy of which will be found in the Appendix marked No. xiv., from the governing bodies of the universities and royal colleges of physicians and surgeons of England, Scotland, and Ireland, relative to the insufficiency of the present position, pay, and retirement of the medical officers of the army, which correspondence was communicated to the Secretary of State for War.

The memorials are unanimous in urging—

“The claims of the medical officers of the army to a position and remuneration more commensurate with their position as men of scientific acquirements, and the importance of their services to the country, as the only means of obtaining for the medical department of the army the services of those best qualified to render that prompt and efficient aid which the exigencies of the services constantly require.”

They consider—

“That it is desirable and important that such inducements should be held out in connection with the medical department of the army, as would attract men of talent and acquirements to adopt this department of the public service for their professional life.”

They go on to state that—

“The existing regulations of the service do not appear to hold out sufficient encouragement, either by present or prospective remuneration and rank, to induce students of the highest order as to education and attainments, to seek for those appointments; and of late years many of that class of students have preferred the service of the East India Company, notwithstanding the searching competitive examination, merely because the conditions of that service, as to pay and superannuation, are on a more liberal scale than in Her Majesty’s forces.”

These are the opinions of men forming the councils of the most eminent medical and surgical bodies in this country, and it appears to us to be impossible to controvert their statements.

We are of opinion that it would be as hopeless as it would be unjust, to demand of the army medical officers, as we are about to do, a higher standard of attainments, and to impose on them more severe professional duties, and more onerous responsibilities, without at the same time raising the stipend on which educated men, members of a scientific profession, on whose skill and assiduity the lives of our troops in a great measure depend, are now made to exist during a long course of years.

The present rates of pay and half-pay were fixed by Royal Warrant in 1840, since which they have continued unaltered. They will be found tabulated in a paper marked X (iii. & iv.) in the Appendix.

Q. 8048-56.

But even the present rates of full-pay, small as they are, are not practically enjoyed as an invariable rule at the periods when they become due, inasmuch as the grant of the increased pay in each rank for length of service is qualified by the following proviso :

“The rates of daily pay for the before-mentioned ranks are to be, in future, regulated by the length of time which the officers of each class shall have served upon full-pay, according to the annexed scale; provided always, that before any officer promoted shall be entitled to claim the full rate of pay for his aggregate length of service in all ranks, he shall serve for 12 months on the lowest rate of pay of his new rank, unless he had equal or higher pay in his former rank; in which case, his rate of pay shall be that next above his former pay, if he had already served thereon 12 months, as he is to complete that period on such rate of pay, under all circumstances, before he attains the next higher pay.”

Vide War
Office Regula-
tions 1848,
Staff garrison
pay, p. 47.

Which is still further aggravated by a subsequent regulation to the effect that—

“All medical officers, however, whose first appointment in the army took place on or subsequently to the 29th July 1830, are to serve two years instead of one year before they shall be entitled to the advantages above stated.”

App.No.X(iii.)

In the Appendix will be found proposed scales of pay, one suggested by the Director-General, and another by Mr. Alexander.

The cost of these improved scales, as compared with the existing rates calculated on the present establishment, is as follows:—

Present rates	-	-	-	-	-	-	-	£ 166,280 per annum.
Rates proposed by the Director-General	-	-	-	-	-	-	-	217,763 „
„ „ Mr. Alexander	-	-	-	-	-	-	-	201,293 „

Q. 8961.

The scale of Mr. Alexander pre-supposes the abolition of the first-class staff surgeoncy, a subject on which we shall offer some remarks when considering the subject of promotion.

We believe that a considerable augmentation of the pay and retiring allowances, but especially of the former, is necessary to the interests of the public service. As regards the State it is difficult to over estimate the value of the services rendered to an army by an efficient medical staff; as regards the individuals, the length and great expense of the preparatory education before the student can be fitted to

discharge the very responsible duties of his profession, must be taken into account. Lastly, it must be recollected that these duties are to be performed in peace over every portion of the globe and in every climate, and in war under circumstances of difficulty and of danger, requiring other qualities besides skill and science, indispensable as those are. The nature of these services and the wear and tear of health and life to which the army medical officers are constantly exposed, may be estimated by the fact that their mortality largely exceeds that of medical practitioners in civil life. Q. 386

With these observations we leave the adjustment of the details of the rates of pay for each rank to the executive government, feeling that they only have the means of making those comparisons with other branches of the service on which an accurate and detailed opinion on this subject can be formed; but we desire to express our entire agreement with the recommendation made by the committee of the House of Commons on this subject, and which is as follows:— Rep. Com.
Med. Dep.
Army, p. 3.

“That the regulation which requires officers of the department to serve in the rank to which they have been promoted, upon the pay of their previous rank, be abolished.

“That the pay of the army surgeons and assistant surgeons be increased, as may be determined by the executive government; but this Committee is in favour of 10s. per diem as the pay of the assistant surgeon on first appointment.”

We are also of opinion that the granting of a limited number of good-service pensions to the officers most distinguished by their zeal and efficiency is due to the department, and will act as a wholesome stimulus to its members. Q. 7565.

We must also add, that we consider compulsory retirement at 65 years of age for the inspectorial ranks, and 55 years of age for the executive ranks, is absolutely necessary for the efficiency of the service. Q. 7565-9.
Q. 7577-80.
Q. 7675-84.

It is not, however, by money alone that the ablest and most accomplished medical men will be attracted to the army medical service: the rank, the position, and the honours which can be attained, constitute perhaps the strongest inducements to the highest class of minds.

Promotion.

The following summary of the grievances complained of by the army medical officers, so far as regards promotion, rank, and rewards, is taken from the memorials which issued from the army in the East in the year 1855. Rep. Com.
Med. Dep.
Army, App.
p. 295.

The memorial of the assistant-surgeons of Her Majesty's army serving in the Crimea, dated July 31, 1855, sets forth:—

“That whilst the assistant-surgeon, having first arrived at the age of 21, must have also undergone a long and expensive course of professional study previous to assuming the subaltern rank allotted him, one wholly unworthy of the dignity of the profession to which he belongs, the executive officer may, without any special preliminary education, join the army at a very early age, and within the short period of two years attain a rank for which a medical officer can become eligible only after a lengthened period of service.

“That the much more rapid promotion of executive than of medical officers during time of war implies also an undeservedly low estimate of the exertions of the latter, who share the dangers of battle, privation, and climate, and are exposed to additional risk of life from constant intercourse with the wounded and diseased, but, unlike their fellows, reap from their services, however distinguished, neither advantage nor reward, in consequence of the long period of service enjoined by the ‘regulations’ before promotion.

“That promotion appears at the present time to be conducted on no definite plan, and is not regulated, as it should be, by consideration of merit, seniority, or service in the field.”

In another memorial from the surgeons serving with the army in the East, and dated August 10, 1855, we find the following expression of opinion on the same subject:— Ditto.
App. p. 304.

“With regard to promotion, we trust your Lordship will not consider us presumptuous if we take the liberty of pointing out to you the necessity and expediency of some fixed principles being established whereby it should be regulated.

“We respectfully submit that a surgeon's relative rank should be that of a field officer after a certain amount of full-pay service; nor would it be too much to expect a participation in those honorary rewards from which at present we are virtually excluded, partly, we suppose, from an idea that we are members of a civil department, although exposed to the fire of the enemy in the execution of our duties.

“We submit that we ought to be classed amongst the purely military branches, and reap our share of the honours accorded to them; the exclusion from which, in all campaigns, we most deeply feel.”

We propose to discuss the subject alluded to in the last two paragraphs under the head of "Relative Rank."

Q. 7378.
7416.
Q. 7408.
We are informed by the Director-General that, except in the case of distinguished service in war, when there is no physical or professional unfitness promotion from the rank of assistant-surgeon to that of surgeon goes invariably by seniority. But this promotion is not given to seniority reckoned from the date of first appointment according to the Army List, but to seniority within the limits of the station or group of stations where the vacancy takes place. The Director-General explains, that owing to the distance from one another, and from home, of the various colonies in which the troops are quartered, the cost of moving the senior assistant-surgeon to or from a distant colony would, in the opinion of the Treasury, be so great, while the interval during which the regiment would be deprived of the services of the newly-promoted surgeon would be so long, as seriously to inconvenience the public service.

Q. 7435-8.
Q. 7462.
This delay might possibly extend over a period of nine months, should the vacancy occur in Canada and the senior assistant-surgeon be serving in New Zealand, or vice versa, the promoted officer being allowed one month in the colony in which he has served, and another in England to settle his affairs. But this is an extreme case, and is stated to be one which has never occurred.

App. No. xv.
Q. 7443-50.
Q. 7451.
To obviate this inconvenience, the Director-General maps out the different parts of the globe, and the promotion goes by seniority within the groups of stations which have been constituted a district or circle for this purpose. Thus, the American colonies with Bermuda form one station. Jamaica is a station in itself. The Windward and Leeward Islands form a third. The Mediterranean, including Gibraltar, Malta, and the Ionian Islands, a fourth. The Cape and Mauritius form a station, and the principal medical officer at the Cape (but no officer of lower rank) is eligible to be promoted to India or Ceylon; that is, a deputy-inspector at the Cape is eligible to be promoted to India or Ceylon, but the regimental or first-class staff surgeon are not.

Q. 7455.
On the other hand, no officers in India, of any rank, are available for vacancies at the Cape, the Indian appointments being the best in the service. Australia, Van Diemen's Land, and New Zealand form a station, and to them as well as to Ceylon the same advantage is extended, with regard to promotion to India for deputy-inspectors, which is allowed to the Cape station.

Q. 7444.
Q. 7447.
This grouping of stations has never been promulgated. Indeed, the Director-General states that "it has not been held to invariably in his time. It has not been laid down so absolutely that it has been always observed." Gibraltar was at one time excepted, and constituted a station by itself, because, yellow fever having broken out there, it was thought fair by the Director-General, that the senior in the garrison where the medical officers had encountered the labour and the danger should be entitled to any vacancy which might occur.

Q. 7760-2.
Q. 9426-7.
Again, Ceylon was sometimes considered, by the late Director-General, as a part of the same district as the Mauritius, and an officer serving in Ceylon has obtained his promotion through a death-vacancy in the Mauritius; while, at another time, an officer in the Mauritius was promoted at the Cape, although two seniors were at the time serving in Ceylon.

Q. 7766.
Q. 7423-4.
The Director-General states that, when the senior assistant-surgeon on the station has served but a short time beyond the period which renders him eligible for promotion, he enlarges the station to meet the special occasion, so as to include some officers of longer standing. There appears, however, to be no defined period of service, within which the assistant-surgeon loses the benefit of his seniority in the district in which he is serving; nor is any rule on the subject promulgated, except the one by which, under other circumstances, the assistant-surgeon is made eligible for promotion after five years' service.

Q. 7406.
But in the case of vacancies created not by death but by promotion, the whole of this machinery is dispensed with, and the senior assistant-surgeon on the Army List is promoted without reference to the distance from which he may come or the inconvenience to which the regiment into which he is promoted may be exposed by the unavoidable delay.

Q. 7464-70.
The Director-General informs us that, with a view the more completely to maintain the principle of seniority, or rather to compensate for unavoidable departures from it when special promotions are given in consequence of service in the field or from other causes, he takes the first opportunity of promoting those who had been passed over by the special promotions. Thus many medical officers who had distinguished themselves by their zeal or skill during the war in the East, or who had served continuously through all the hardships and dangers incidental to those campaigns, were rewarded by promotion irrespective

of seniority, and their seniors who, being in Australia or elsewhere during the same period, had had no such opportunity of distinction, would likewise be promoted to compensate them for their ill fortune. Had this principle been always carried out, the result would have been that when Gibraltar was excepted from the Mediterranean, and constituted at station in itself, in order to assure to medical officers at Gibraltar the promotion to which they were entitled for their risks and exertions during the prevalence of yellow fever, the assistant-surgeons at Malta and the Ionian Islands should likewise have been promoted to compensate them for not having had the opportunity of distinguishing themselves at Gibraltar.

When a reduction takes place at the conclusion of war, the usage in the Army Medical Department is to reduce, not the juniors of each rank, as in other branches of the service, but the juniors dating from the first entry into the service, irrespective of their seniority in the rank they have acquired. Q. 7495-7.
7504.

This rule is designed to counterbalance the irregularities or inequalities which the previous promotions on the system we have described may have created.

By this arrangement, a medical officer promoted for distinguished service in the Crimea might be reduced, while another promoted as a compensation for his having had no opportunity of distinguishing himself, though promoted after the other, would, in right of his original seniority in the service, remain on full-pay, and the man who had successfully encountered both the danger and the hardships of war would be in the worse position. Q. 7870.

A reference to the return marked No. xvi. in the Appendix will show how irregularly, even before the war, these regulations acted on a rank professedly promoted by strict seniority. Indeed, many of the medical officers whom we examined stated that they were unable to say whether the principle of seniority or of selection regulated the promotions in the lower ranks, and that they could not explain, because they had been unable to ascertain, what the regulations as to promotion were. App. xvi.
Q. 2284.
Q. 8762.
Q. 7734.
Q. 7752.

The Director-General states that these rules are very complicated, and have never even been reduced to writing in any systematic form, but are well known to himself, and are to be found scattered over a correspondence of 40 years. Com. A.M.D.
Q. 4552.

It appears to be the practice of the Director-General, who is anxious to prevent any general rules from operating harshly on individuals, to avoid such a result by a fresh enactment to meet each special case as it arises. The chief advantage derivable from the principle of seniority is the certainty it gives to every man that he will be promoted in his turn, but no such certainty can be felt under the system we have described, while at the same time the stimulus which is supplied by selection is entirely wanting. Q. 7498.

Practically the result has been that, in the lower ranks the principle of seniority, so far as it consists in promoting each man in his turn, according to the date of his entry into the service, is nullified, and the rules by which the Director-General seeks to compensate for such departures from the strict principle of seniority and equalize the chances and the career of each officer being unknown to the service, dissatisfaction has been created, and sometimes even motives have been imputed, which a full explanation of the history of each case would often show to be entirely unfounded. Q. 7867.
Q. 8149-57.
Q. 7479-82.
Q. 7425.
Q. 9466.
Q. 7919.

To us it appears that such a result not unnaturally attends a system where so much explanation is necessary, and so little can be given, and we doubt whether any large department can be satisfactorily administered except on some simple and intelligible principles, which should be patent to all, and which should not be departed from, except on occasions previously specified.

It is true that all general rules must occasionally press hardly on individuals, but at the same time they inflict no individual injustice, though they may produce individual hardships, for all are aware of the existence of the rule, and of the effect it may have; and the man who suffers, though he may complain of the rule, feels no resentment against his chief, who he knows is bound by it, and is not the author of the hardship he undergoes.

We are not aware that there is any branch of the executive, except the army medical service, in which promotion is awarded by the head of the department, unguided and unrestrained by any regulations which are binding upon him. In the civil departments, the promotion of the clerks is regulated from time to time by the Treasury. In the navy, the First Lord administers promotion according to certain fixed rules and regulations laid down by Order in Council, and from which he has no power to depart. In the army, the Commander-in-Chief is in like manner bound by Royal Warrants granting him powers which he has no authority to exceed, and laying down the most precise rules to guide and restrain him in the exceptional cases in which he is empowered to use his discretion; and we conceive that justice, both to the department and to the

Director-General who administers it, requires that clear rules for his guidance should be laid down by proper authority, and promulgated in the ordinary way. We believe that much of the dissatisfaction prevailing in the department will be removed by this course, which will also relieve the Director-General of much responsibility and odium, now unduly thrown upon him.

Q. 7376. As regards the future, the Director-General suggested for our consideration that promotion from the rank of regimental or second-class staff surgeon to that of first-class staff surgeon be made by selection as now, but that all subsequent promotions from that rank upwards to deputy inspectors and to inspectors-general be by strict seniority, Q. 7382. unless the officer be evidently incompetent. Q. 7387.

Q. 7398. As the Director-General considers the rank of first-class staff surgeon to be generally an inspectorial or administrative rank, there appear to us to be grave objections to this suggestion, by which those who on trial show no peculiar aptitude for the duties devolving upon them would, equally with those who do, be promoted to charges of still greater difficulty and responsibility.

It appears to us that an adherence to the rule of strict seniority in the lower ranks, with some exceptions which we will afterwards specify, and strict selection in the upper ranks, constitute, upon the whole, the system most likely to work beneficially for the interests of the public service.

Q. 4574. To attract a fair proportion of the best medical pupils to the military service, two conditions are necessary,—certainty of a competency and the hope of distinction. Men who enter a profession after a long and expensive course of study, and who give proof of their proficiency by subjecting themselves to the ordeal of a competitive examination, have a right to expect that if their professional and personal conduct be unobjectionable, they shall have guaranteed to them the prospect of rising to a rank in the service which, while assuring to them the means of subsistence, shall give them a certain standing and position in society. On the other hand, the hope of rising by merit or distinction to high rank, or to posts which, though unattainable except by a few, confer on those who succeed the highest honours which the profession has to give, operates strongly at the age at which men choose a profession, and when each is sanguine of success in the race in which he is about to engage. We believe that some of the most ambitious would be deterred from entering the service, if, by a uniform adherence to the sole principle of seniority through all ranks, the prospect of rapid rise to the higher grades and emoluments of the profession were denied to energy and to talent. Q. 554.

Q. 547. No doubt at a later period these feelings are less prevalent, and greater certainty with less effort would be preferred by the majority of the profession. In fact it must be the interest of the majority of every profession to equalize the chances of all to the prizes which otherwise can only fall to the more energetic efforts of the few. But the first consideration must be the efficiency of the public service, and for this, as it appears to us, selection for the higher ranks and employments is indispensable. Even if every man were equal, as regards ability and attainments, yet means must be found to pass some men sufficiently rapidly through the lower ranks to secure in the higher the services of men still in possession of physical vigour for the discharge of the important duties to be imposed upon them. If some such means be not found, all would advance together, and by the time they reached the highest ranks all would be unfit through age and infirmity to discharge their functions. It has been proposed to obviate this objection and to quicken the stream of promotion by a large extension of liberal retirements to the senior officers. But no minister would make and no House of Commons would listen to a proposal largely to augment the annual burdens of the country for non-effective services when it can be shown that the same results may be obtained (and, as some think, even more advantageously) by a well-regulated system of selection, which costs nothing, and brings the ablest men to the head of their profession while their physical energy is still unimpaired. That selection may not always be judicious, and that mistakes will sometimes be made, is undeniable and inevitable. But when it is asserted that selection from 50 or 100 men will not always produce the ablest, it must be remembered that seniority does not so much as attempt to do it, but knowingly and without hesitation promotes, perhaps the most ignorant and the least efficient of the whole. Q. 556.

Q. 7815-16. With these opinions, we should much regret to see the power of selection parted with in any rank in which it is now exercised, and we recommend that promotion from the rank of regimental and second-class staff surgeon to the ranks above be invariably by selection, and that promotion from assistant surgeon be by seniority, except in cases of distinguished service, such as would not only justify but require immediate

promotion irrespective of seniority. Such departures from the rule of seniority should, however, as in the case of combatant officers promoted by selection for distinguished service by the Commander-in-Chief, be guarded by similar formalities to those laid down in the promotion warrant of 1854; and the Commander-in-Chief, in forwarding to the Secretary-of-State the name of the medical officer thus exceptionally promoted, should state the services for which the promotion is granted, in order that they may be published in the Gazette.

As regards ordinary promotions by seniority, we doubt the necessity, now that communications are so much shortened, of retaining the separate groups of stations within which only, in the case of death vacancies, the promotion is to take place, the more so as a contrary practice is already pursued in the case of other vacancies; or if it be found necessary still to retain any divisions, it appears to us that two groups, one to the east and another to the west of the Cape, the former including the Cape itself, would be sufficient for the purpose in view.

In the latter case the antedating of a few commissions would still be necessary.

Q. 7421.

7440.

Every full surgeon therefore would, unless he had been specially promoted for merit, stand in his rank in the same order of seniority with his first entry into the service.

Above that rank his rise would depend on his ability and character; and it appears to us that, under these circumstances, the complication arising from reckoning seniority in two ways, namely, seniority in the rank and seniority in the service, would be done away with, and, as in other branches of the service, no seniority would be recognized except that of rank and the date of commission in that rank. It is only in questions of pay and of retirement, where age, and not rank, is the cause of unfitness, that seniority in the service should be considered.

It seems unjust, when a man has been rewarded for his services by early promotion, to deprive him subsequently of any of the advantages which he has earned, in order to compensate those whom, by his own exertions, he passed in the earlier part of his career.

On reduction, the junior officers in each rank would then be the first put on half-pay, and subsequently the seniors of the reduced officers in each rank would be the first restored.

Much difference of opinion prevails as to the value to the service of the rank of first-class staff surgeon, and as to the character of the duties which ought to attach to it, or which are now performed by the officers holding that rank.

The Director-General considers that the rank is generally not executive, but inspectorial, that is, that the first-class staff surgeons for the most part do not treat disease, but inspect those who do, and take their share in the administration of the hospital; and he considers the rank valuable as enabling him to appoint to stations too small and unimportant for a deputy-inspector, an officer who can discharge all inspectorial duties at a lower and more suitable rate of salary.

Q. 7398

Q. 7668.

At present the army medical department is divided into five ranks, namely, inspectors-general of hospitals, deputy-inspectors, first-class staff surgeons, second-class staff surgeons, ranking with regimental surgeons, and, lastly, assistant surgeons.

Q. 7256.

Of these five ranks, the first two are purely inspectorial, the third of a mixed character, and only the last two purely executive.

Q. 7365.

It was urged before us, that if five ranks be maintained, the majority, at any rate, should be executive.

Q. 7703.

Some even assert, that a first-class staff surgeon is already an executive officer, the fact being, that in the late war they were ordered so to act in order to strengthen the executive medical staff.

When there is no practical distinction between the duties to be performed, as is the case in the civil medical profession, no distinction of ranks is recognized, but in a military service where inspectorial and administrative duties are required, the latter almost wholly foreign to the profession of a medical man, some distinctions of rank are necessary. It appears to us, however, that they cannot be too few, and as all the changes we have proposed in the organization of our hospitals will tend to reduce if not entirely to supersede the mere administrative duties which have been hitherto, as we think, improperly imposed on medical men, and as the higher standard of acquirement proposed to be exacted of candidates for the Army Medical Department, and the additional means of instruction to be afforded them, will make inspection less difficult than heretofore, we are of opinion, that if one of the five ranks can be suppressed, it should be one of the inspectorial, and not one of the executive ranks.

We consider that the balance of evidence is in favour of the abolition of the first-class staff surgeoncy as a separate rank, but that the regimental surgeon and the staff surgeon (now called second-class staff surgeon) should after 20 years' service be called surgeon-majors, with a small addition to their daily pay.

In the few cases, which the increased concentration of our troops renders every day rarer, where the smallness of the force will not justify the appointment of a deputy inspector, the senior medical officer on the station could perform the slight amount of inspectorial duty required; on the other hand, justice to the department dictates the appointment of a deputy inspector whenever the force is sufficient to warrant the presence of an officer of that rank.

Q. 7401.

In the two upper or inspectorial ranks, we hold that the public interests require that promotion should go by selection of the ablest and most efficient officer, and, in recommending to the Commander-in-Chief, who is responsible for all promotions, the officer to be promoted, we are of opinion that the Director-General should always notify the relative position of the officer in his rank and the grounds on which the selection is made. The Director-General states that this course is occasionally pursued by him, and if it were invariably adopted, and the grounds of each recommendation were recorded, we think that much mis-interpretation, and consequent dissatisfaction, would be avoided.

Q. 7627.

Q. 7648, 9.

Q. 5689-91.

These selections would, of course, be founded partly on personal observation, partly on the case books of the medical officers, partly on public reports and despatches, and partly on the confidential reports, made by the principal medical officer on each station, of the character and capabilities of the officers serving under him. As the question of confidential reports has excited a good deal of attention, and was the subject matter of so much complaint before the committee of the House of Commons on the Army Medical Department, that the committee made special mention of those reports, and recommended that the practice of the Director-General should be assimilated to that of the Adjutant-General regarding them, we thought it our duty to ascertain from the Director-General how such reports are dealt with. The Director-General assures us that no officer can now be injured by a confidential report affecting his character, of the existence of which he is not aware. Sir John Hall, in his evidence, states that he had never made a confidential report against a medical officer without informing the officer reported against of the fact and of the substance of the report, and he considers such a course the only one which can be taken compatibly with fairness and justice to the officer affected. We have no evidence to show whether this is an universal or even a common practice, or one adopted by Sir John Hall and by him alone, but the Director-General assures us that any report injuriously affecting the character of an officer is always, either in extenso or in substance, communicated to the officer reported against, in order that he may offer any explanation in defence which he may wish to make. We entirely approve of this practice, which appears to us to be the only fair and honourable one which can be adopted. The inspecting officer is more likely to report unreservedly when the contents of the report are not published but communicated only to the officer affected by them, and the inspected officers may feel confident that no secret charges can be made against them which would stop their promotion without their being afforded an opportunity to rebut them.

Q. 7630.

Q. 9391-2.

Q. 7635-6.

Q. 8263-6.

Q. 8822.

We recommend that the rules of promotion for the Army Medical Department, with the modifications which we have proposed, be laid down in a Royal Warrant, together with the new rates of pay and retirement.

Roster of Service.

Q. 7896.

Several witnesses have strongly urged the establishment of a roster for foreign service according to which every officer of the medical staff would go abroad in his turn and have an equal share of foreign service, and the practice of the medical department of the Ordnance previous to its amalgamation with that of the army is adduced in support of the proposition.

In the lower ranks it is possible that a roster, such as has been described, might be established and in time of peace maintained, and no doubt its observance would be a source of great convenience to the officers of the department; but we must make this qualification to any recommendation on the subject, namely, that the amplest discretion must be vested in the Director-General to select for each station the principal medical officer whom he may think from experience and character likely best to discharge any peculiar duties which may attach to the medical charge of that particular station.

Relative Rank.

Complaint has been made that the relative rank conferred upon medical officers is not in all the grades so high as the value and importance of the department would seem to justify. An inspector-general ranks as a brigadier-general, a deputy inspector as a lieutenant-colonel, a first-class staff surgeon as a major, a regimental and second class staff surgeon as a captain, and an assistant-surgeon as a lieutenant.

It has been suggested, inasmuch as the medical officers remain for a great length of time in the same grade, and the combatant ranks exceed their own in number, that an increase of relative rank ought to be granted to the medical officer after a stated amount of service in each grade. That an assistant-surgeon, after 10 years service, should rank as a captain; the surgeon, after 15 or 20 years service, as a major; that the deputy-inspector, being the second rank in the medical service, should on appointment at once rank as a lieutenant-colonel, and that like a lieutenant-colonel he should, after three years service, rank as a colonel; and that an inspector-general, being the chief medical officer of an army in the field, should rank as a major-general. Q. 7591.
Q. 7696.
Q. 7943.
Q. 8964.

A more serious complaint which has been urged is that the value of this relative rank and the practical advantages which it is meant to confer on the individual holding it are undefined, and vary according to the interpretation which commanding officers may put upon it. That relative rank should confer any military command is, of course, out of the question, and no medical officer would for one moment contend for an authority for which he is manifestly not qualified, and with which, even if qualified, he could not be invested without detriment to the public service; but medical officers represent that, if ordered to sit on courts-martial or on mixed boards, they should sit according to their relative ranks and the dates of their commissions. There are no regulations in the Queen's service either one way or the other on this subject, and usage appears to vary, some officers stating that they have sat as juniors to the junior combatant officer, however senior they might be to him in relative rank; others that they have sat according to their rank and the dates of their commissions, but that the precedence was granted to them more as a matter of courtesy and good feeling than of right. Q. 7592.
Q. 7944-50.

It is stated in evidence by Dr. Arnott, a surgeon in the East India Company's Service, that prior to the year 1847-48, he and others sat on committees and boards in the order of their rank; but in that year, a regulation was issued to the effect, that medical officers, however high their rank, should sit on boards as junior to combatant officers, however low their rank. Q. 8340.
Q. 8344.
8357.

In consequence of this change, the Indian medical officers avoided as much as possible positions which exposed them to an indignity which they keenly felt; and Dr. Arnott gives it as his opinion, that if the regulation be maintained, medical officers should be relieved from all duties of this description. Q. 8363.

In a minute upon the reformation of the Indian army medical service, written shortly before leaving India, the late Governor-General Lord Dalhousie makes the following remarks upon this regulation:— App. No. xvii.

"35. But the most galling, the most unmeaning and purposeless regulation, by which a sense of inferiority is imposed upon medical officers, is by the refusal to them of substantive rank.

"The surgeon and assistant-surgeon rank invariably with the captain and lieutenant, but the rank is only nominal wherever medical officers and others are brought together on public duty; the former has no rank at all, and the oldest surgeon on the list must, in such case, range himself below the youngest ensign last posted to a corps.

"36. It is impossible to conceive how such a system as this can have been maintained so long, on the strength of no better argument than that 'it has been,' therefore 'it ought to be.'

"It is impossible to imagine what serious justification can be offered for a system which in respect of external position postpones service to inexperience, cunning to ignorance, age to youth; a system which gives a subaltern who is hardly free from his drill precedence over his elder, who, perhaps, has served through every campaign for thirty years; a system which treats a member of a learned profession, a man of ability, skill, and experience, as inferior in position to a cornet of cavalry just entering on the study of the pay and audit regulations; a system, in fine, which thrusts down grey-headed veterans below beardless boys."

It seems to us impossible to deny the justice of these observations. It may be advisable to abstain, save in cases of necessity, from summoning medical officers to sit on courts-martial; yet there are occasions when their presence may be of great value to the court, and on mixed boards their assistance is often indispensable.

It appears to us clear that if the medical officer is to discharge these duties, he is entitled while discharging them to the respect due to his rank and to the commission which he holds; and though in the case of courts-martial there may be reasons why

the senior combatant officer present should always be the president, we hold that, relatively to every other member of the court, the medical officer should sit according to his rank and the date of his commission in that rank. On the same principle medical officers, when supplied with quarters by the public, should have a choice according to their relative ranks; and the allowance of prize-money, batta, allowances to heads of departments on foreign stations or with armies in the field, coals, and candles, should be regulated by the same rule.

We entirely concur with the following recommendations made by the Director-General,—

Report Com.
Ar. Med. Dep.,
App. p. 317.

“The number of servants allowed to medical officers to be determined according to their relative rank; that is, each medical officer to have the same number as is allowed to the military officers with whom he ranks.

“The observations in reference to servants will equally apply to the case of horses and forage allowance.

“Surgeons of regiments should not have to pay a daily stoppage on account of the forage allowed them for their horses.

“At present the surgeon of an infantry regiment is subjected to a deduction from his pay of $8\frac{1}{2}d.$ per day in consideration of the forage he receives; whereas the lieutenant-colonel, the majors, and the adjutant, who are like him allowed forage, pay nothing. This appears an anomaly; if all require horses for the due discharge of their duties, it seems unreasonable that the surgeon should be differently treated to the combatant officers.”

The following is the scale of relative rank proposed by the Director-General:—

“Assistant-surgeons under 10 years’ service as lieutenants, according to date of commission.

“Assistant-surgeons above 10 years’ service as captains, but junior of the rank.

“Surgeons under 15 years’ service as captains, according to date of commission.

“Surgeons above 15 years’ service as majors, but junior of the rank.

“Staff surgeons of the first class, under 20 years’ service, as majors, according to date of commission.

“Staff surgeons of the first class, above 20 years’ service, as lieutenant-colonels, but junior of the rank.

“Deputy inspectors-general, under 25 years’ service, as lieutenant-colonels, but junior of the rank.

“Deputy inspectors-general above 25 years’ service, as colonels, according to the date of commission.

“Inspectors-general, as brigadiers-general, according to date of commission.”

If the rank of first-class staff surgeon be abolished, the surgeon-major would have the same relative rank as the present first-class staff surgeon.

We think, however, that all officers of the inspectorial grades should rank not as juniors, but according to the dates of their commission; and that an inspector-general, being principal officer of an army in the field, should rank as a major-general.

The officers of the Army Medical Department complain that they are not considered to be entitled to the same honorary distinctions as combatant officers, or, at any rate, do not receive them in the same proportion. There is, perhaps, no profession affording more opportunities than theirs of individual distinction, founded on professional superiority, and none in which it is more important to the interests of the army that individual zeal and exertion should be stimulated to the utmost.

We are informed that by the statutes of the Order of the Bath no one can receive its honours unless he shall have been mentioned in a public despatch for services rendered before the enemy. But the most arduous and the most dangerous services of medical officers are not always, even in war, rendered before the enemy. They have to strive with an enemy more dangerous than man. In the almost pestilential wards of Scutari the exertions required were more continuous, the danger was greater, and the honours and rewards to be obtained were fewer, than at the front before Sebastopol. The mortality of the medical officers at Scutari was not much exceeded by that of the combatant officers with the army in the Crimea, but the survivors are debarred from receiving those honours which, fortunately for the country, are prized more than either rank or emoluments.

O. 8978.
Q. 8838.

It has been proposed that a limited number of the most meritorious officers of the department should have the honour of being named honorary physicians and surgeons to Your Majesty, a distinction which it appears to us that the profession eminently deserves.

Q. 7963-71.

To another subject affecting the respect paid to medical rank, we think it our duty to make some reference, inasmuch as it has been the cause of pain and irritation to the friends of deceased medical officers at a moment when every fair consideration should be shown to their feelings. The existing regulations sanction the burial of a deceased regimental medical officer with the military honours allowed to officers of his relative rank, whilst in the case of staff medical officers those honours are limited, firing over their graves being forbidden. This practice has always been regarded by staff medical officers as

an act of injustice; and some, when dying, have requested to be buried privately, from a dislike to have it supposed by soldiers that they were inferior to other officers. We think that all fair grounds for discontent on such a subject should be removed, and we recommend that every deceased medical officer, whether regimental or staff, should be buried with the military honours that attach to his rank.

Our attention has been called to other and minor points in which the army medical officers consider themselves aggrieved, as regards rank and precedence.

For example, in the Army List, the medical staff is placed in the list of each regiment after the other members of the regimental staff, though the relative rank of the surgeon is always higher than that of the adjutant, the quarter-master, and the riding-master, and frequently is higher than that of the pay-master.

Again, in the General Army List, the department is placed after others which, though Q. 6294. most important and respectable in themselves, can scarcely be held upon an equality with a scientific profession which stands justly high in every civilized society.

We are aware that these matters may appear trivial to many who consider that the respect in which the medical profession is held places it above the necessity of seeking or accepting the adventitious aid which mere patents of precedence can afford. But in the military service rank is everything; there exists no authority without it, and a civil department, which by its connection with the army has acquired a semi-military character, cannot maintain its position while debarred from the rights and privileges appertaining to it. Small, therefore, as these matters may appear, still they are taken as indications of the degree of respect with which the Government regards the medical department, and of the estimation in which it is intended by them that its officers should be regarded by others.

As regards uniform, we are informed that some medical officers wish for an alteration, obliterating the peculiarities, such as the black plume and sash, which distinguish the medical from the combatant officer. It must be obvious that in and after an action it is of the utmost importance that a medical officer shall be known by some easily-recognized distinction of costume; and we must add that medical officers who wish thus to be made undistinguishable from combatant officers can have but little appreciation of the dignity of their own profession.

We recommend that the rank of first-class staff surgeon be abolished, and that after 20 years service, surgeons, whether attached to regiments or the staff, should be styled surgeon-majors, with a small addition to their pay.

That the rule of seniority be strictly maintained in the promotion of assistant-surgeons to the rank of surgeons, except in case of incompetency or misconduct; that no exception be made to this rule save for distinguished conduct, when the services for which the officer is promoted shall be published with his name in the Gazette, and that the seniority be that in the army, without reference to the station on which the officer to be promoted may be serving.

That the promotion to the ranks of deputy inspector and inspector be by selection for merit; that in the recommendation to the Commander-in-Chief the Director-General shall state the position on the Army List of the officer recommended and the grounds of the selection; and that all surgeons shall be eligible for promotion to the rank of deputy-inspector.

That any confidential report by which the character of an officer is unfavourably affected shall be always communicated to him, and an opportunity given him of offering his explanation in defence.

That the relative rank of the army medical officers be revised, and that such rank carry with it the same advantages as to quarters, allowances, precedence, &c. &c., as substantive rank, and that except in the case of the presidency of a court-martial, medical officers should sit on courts and on mixed boards according to their relative rank and the dates of their commissions.

That a limited number of medical officers of distinguished merit be appointed honorary physicians and surgeons to Your Majesty.

That the Army Medical Department be held entitled to the same share of honours and rewards as combatant officers of the same rank.

That in the Army List the medical department should have precedence of the commissariat, and that their names should appear according to their rank, with the dates of their commissions in the list of the regimental staff, and that the whole regimental staff shall be placed before the list of captains.

That a limited number of good service pensions be granted to medical officers of distinguished service.

Lastly, that the regulations as to pay and retirements, promotion, rank, honours, and rewards, be embodied in a Royal Warrant for the regulation of the Army Medical Department.

Constitution of the Army Medical Department.

There remains to be considered whether any change be necessary in the constitution of the office of the Director-General of the Army Medical Department.

The constitution of this office has, since the commencement of the revolutionary war, been subjected to frequent changes.

App. No. xviii. In 1793 a board was formed, consisting of the Physician-General, the Surgeon-General, and the Inspector of regimental infirmaries. In this board collectively was vested the general superintendence of the department, and the sole right of recommending for appointments and promotions.

But in 1798 they ceased to act as a board; and distinct duties and patronage were assigned to the members, each being made responsible solely for his own acts. The Physician-General recommended the physicians for appointments; the Surgeon-General recommended the deputy inspectors, regimental and staff surgeons, and assistant-surgeons; and the Inspector-General had the nomination of apothecaries and hospital mates.

In 1810, on the recommendation of a Parliamentary committee, the board was dissolved, and a Director-General of army hospitals appointed, with two principal inspectors of hospitals to assist him, without control in the management of the department.

Since that period, with occasional changes in the number and rank of the subordinates, the powers have been vested in the hands of one officer, sometimes under the denomination of Superintendent, but generally, as now, under that of Director-General of the Army Medical Department.

The great amount of purely professional and technical business transacted by the head of the medical department, naturally exempts the office from that control and interference on the part of superior authority to which other branches of the executive are subjected.

It therefore becomes the more necessary that the office should be so constituted as to afford the greatest security for the due and efficient performance of the duties which it has to discharge.

The past experience of boards, consisting of three or more members, each having co-ordinate authority, is not such as to warrant any great confidence in their administration. Quarrels and jealousies have paralyzed their action and impeded the public service, or else unanimity has been secured by a series of compromises in which the interests of the public have been less considered than the ease and comfort of the members of the board.

On the other hand while securing that sole responsibility which the vesting of authority in the hands of one man alone can give, care must be taken that so much business be not put upon him as to compel him to delegate a large portion of his duties to inferior and irresponsible hands, or to deprive the public service of the advantage of the suggestions which the bringing of several minds to bear on the business to be transacted or the measures to be taken is sure to elicit.

If the recommendations which we have ventured to offer be carried into effect, the duties and the responsibilities of the Director-General will be considerably augmented.

We have shown the necessity of attaching to the Army Medical Department a statistical officer, upon whom would devolve the collection and preparation of statistics, which would enable the Government and the public, by frequent, clear, and minute comparisons, to judge, not only of the state of health of the army in general, but of every station and every barrack in which the troops are quartered.

We have shown the necessity, with a view to the encouragement of medical officers in the study of their profession and the promotion of science, of carefully examining all the case books of the regimental and staff officers employed, and of selecting for publication whatever is most worthy of remark.

We have shown the necessity of appointing sanitary officers to assist in the field, of rendering it imperative on commanding officers, whether at home or abroad, in peace or war, to ask, and on medical officers to give, their advice on every sanitary point affecting the health of the troops, whether as regards food, clothing, encampments, barracks, or hospitals; and this under the varying conditions of the different climates to the effects of which soldiers are exposed.

We have shown the necessity of an immediate and complete sanitary reformation of our hospitals and barracks, both at home and abroad, and there follows, from these

recommendations, the necessity of attaching a sanitary officer to the Army Medical Department.

These offices within the department should be conducted by the ablest men that can be found.

For a man to be at once an authority in sanitary science, in statistics, in medicine, and in surgery, and to be at the same time endued with all the method, foresight, and calculation requisite to govern a great department, and direct all the measures necessary, whether by way of prevention or remedy, to secure the health of a large army, in peace and war, scattered over half the globe, would require a union of qualities which has never yet been seen in the medical, nor probably in any other profession. Nothing could be more unjust than to impose on any one individual so impossible a task. It is only by a division of labour that such duties can be performed with any chance of success.

In war especially, when to the administration of a fixed daily routine are superadded the rapid supply and the anticipation of the wants of armies in the field, the adaptation of old systems to new exigencies constantly occurring, and varying in their character according to the nature of the operations and the peculiarities of the country and climate, the resources of no one mind, however creative and fertile it may be, can be sufficient, unaided by the suggestions, advice, and judgment of others, adequately to discharge duties so multifarious.

Sir John McNeill, while urging the necessity of vesting in one person the whole power to decide, and the consequent responsibility for the course ultimately taken, forcibly pointed out the advantages of a council to the head of a department, and instanced the number of cases in which he had himself, as head of a large department, modified or changed his views, when the suggestions and criticisms of his colleagues had been brought to bear on the subject-matter of their discussion. It appears to us that the object to be aimed at is, first, to secure that rapidity of decision and action, and that undivided responsibility which can only be obtained by vesting the full power and authority in the hands of one man; and secondly, to provide that the subject-matter of such decision and action shall first have been subjected in council to the examination and judgment which other intelligences can bring to bear upon it. Q. 9764.

In support of this proposal Sir John McNeill quotes the constitution of the governments of the three presidencies in India, in each of which the public business is transacted by the Governor in council. Q. 9769.

"The propositions are made to the council, and the members of the council are entitled to express their opinions; nay, they are enjoined to express their opinions, and minutes of those opinions are read in council, and it rests with the Governor, after he has heard and seen those opinions, to decide for himself, and he decides with the knowledge of those opinions, and in disregard of them if he considers it for the advantage of the public service."

We are of opinion that deliberative boards, composed of members having equal authority and carrying their decisions by vote of the majority, are not efficient instruments of administration.

On the other hand, we are satisfied that a single head, unaided by a division of labour for details, and by the suggestions, advice, and judgment of a council, cannot adequately discharge duties, very onerous from their amount, and requiring, from their multifarious character, a knowledge of distinct specialties with which no one man can be equally acquainted.

With these opinions, we recommend that the Director-General should have three colleagues associated with him, who should be appointed by the Secretary-of-State for War, and should be selected for their eminence in medical, sanitary, and statistical knowledge respectively. Those officers would act as the council of the Director-General, and should have the power of submitting any questions to the board, and of expressing their opinions in writing, and minutes of all proceedings should be recorded by a secretary; but the Director-General, acting upon his own responsibility, might disregard those opinions if he consider it necessary, recording his reasons for so doing. Q. 8988-96.

All matters of routine would be referred to the head of the branch to which they belong, and only such matters would be subjected to the consideration of the council as are of importance.

We find in the report of the select committee on "army and navy appointments," in 1833, and in the "Report of the Commission on Promotion in the Army," which sat in 1854, a recommendation that all staff appointments in peace, except that of Commander-in-Chief and his personal staff, be held for a period of five years, subject to re-appointment at the termination of that period if the interests of the public service should require it. We are of opinion that a similar regulation should apply to the Director-General and

council of the Army Medical Department, except that a longer period should be fixed for the tenure of the office of Director-General.

The salary of the Director-General is 1,200*l.* a year. In our opinion such a salary is quite inadequate for an officer of so much importance. The Director-General is the administrative head of a scientific profession. He cannot satisfactorily discharge the duties imposed upon him unless he possess great knowledge and attainments. He has entrusted to him the direction of a department numbering no less than 788 officers on full-pay; and he is responsible for the health of an army of 150,000 men, serving in every part of the world and in every variety of climate.

We therefore feel it our duty strongly to recommend a revision of the salary now attached to the office.

We beg to sum up the practical results of our inquiry in the following Recommendations, as regards

BARRACKS, &c.

We recommend that in future a minimum cubic space of not less than 600 feet be allotted to each man in his barrack-room and in the guard-room, and that an interval of at least three feet be allowed between each bed in the former.

That urine tubs be on no account tolerated in the barrack-rooms; but that urinals with a water supply outside the barrack-room, or common chamber utensils, be substituted.

That every barrack should contain ablution rooms and baths, laundry and drying-room, and workshops; and also, that suitable provision be made for non-commissioned officers' and married soldiers' quarters.

That day-rooms be constructed for the use of the men in some of the principal barracks at home, and, if found advantageous, that they be extended to all barracks.

That all barrack-rooms, guard-rooms, and day-rooms be sufficiently warmed and lighted, whatever may be the number of men occupying them; and that gas be used for lighting whenever it is obtainable.

That, with a view to enable the soldier to have variety in his meals, the means of baking, frying, &c., be provided in the kitchens of all barracks and hospitals.

That, with a view to the thorough ventilation of the barracks, the diminution of overcrowding, the abolition of cesspools, and the formation of proper drainage and sewerage, and an abundant water supply, a Commission be immediately appointed, consisting of an engineer officer, and a medical officer versed in the practical application of sanitary science, who, together with the medical officer and the barrack-master of the inspected barrack, shall systematically undertake the inspection of every barrack, and devise and execute the necessary works with such expedition as the available resources of the Government may permit, until every barrack in use shall, in its turn, have been brought to a healthy and satisfactory condition; and that in the meanwhile, immediate orders be given to the barrack department to revise the allotment of men to rooms, so as to divide the cubic space more equally, and when the barracks are not full, to occupy additional rooms, thereby reducing the numbers in each, and thus as soon as possible secure to each soldier at least the minimum space recommended by us.

That, in future, before a barrack is built, the advice and opinion of competent medical officers be taken as regards both the site and plan.

That, in order to secure that sanitary considerations shall not be overlooked in the choice of sites for encampments, hospitals, barracks, or in any matter involving the health of the troops, such as water supply, drainage, food, clothing, &c., medical officers be invariably consulted; and in order to fix on commanding officers and on medical officers the responsibility properly belonging to each, that the medical officer shall be required to give his advice in writing, the commanding officer to affix in writing his reasons for rejecting it, if he think fit to do so, and to transmit the document to superior authority.

That, in order to secure to the commanding officer of an army in the field the most efficient sanitary advice, and to relieve the principal medical officer of duties which his other avocations leave him no time to perform, a sanitary officer be appointed to act under the authority of the principal medical officer, but to be attached to the staff of the quartermaster-general.

That inquiry should be made into the French system of gymnastic exercises, with a view to the adoption of some similar practice in the British army.

That facilities and encouragement be given for all athletic games, such as fives, cricket, quoits, single-stick, for gymnastic exercises, &c., and that the men be employed on different kinds of labour when possible.

RATIONS, CLOTHING, &c.

We recommend the consolidation of the present stoppages for ration and regimental messing, and, in consideration of that consolidated stoppage, the issue to the soldier by the commissariat of a sufficient amount of food for three daily meals, including vegetables, tea, coffee, and sugar, with such variations abroad as the climate or the market may render necessary.

That the soldiers' "necessaries," hitherto obtained by regimental contract, be provided by the commissariat.

We recommend the adoption of a better boot; also a lighter stock of the pattern specified; a more horizontal peak to the forage cap; and the substitution of a light cap, with a wadded linen cover or a roll of linen, for the shako in hot climates.

That greater attention be paid to the interior form of the head-dress, whether shako or busby; that the great coat be of a better quality and more durable texture, that all clothing be made sufficiently loose to permit the free use of the limbs and unimpeded action of the muscles, and that the material of the clothing be varied according to the climates in which the troops may be serving.

We strongly recommend the immediate testing, by its issue to half a battalion, of the "Berrington" knapsack sling.

HOSPITALS.

We recommend that in all cases competent medical sanitary officers should be consulted as regards the selection of site, and the original construction of hospitals to be built; and that the opinion of those most conversant with the interior economy of large civil as well as army hospitals be taken before any plans are finally approved.

That the present minimum space allowed by the regulations to each bed be increased from 600 feet at home and 800 in tropical climates to 1,200 at home and 1,500 in tropical climates; and that a minimum distance of 4 feet between the sides and 12 feet from foot to foot, and as much more as the size of the ward will allow, be maintained between the beds.

In the construction of new hospitals, we recommend the plan of separate pavilions, with lateral windows on opposite sides, and natural ventilation.

We recommend the use of Parian cement or other impervious material for the walls and ceilings of hospital wards, in lieu of bare brick or plaster.

That sufficient provision be made for warming and lighting the hospital according to the weather and season, on the requisition of the medical officer in charge of the ward.

That water-closets be built in connexion with every hospital, and an efficient sewerage effected by impervious drains not passing under the building, all cesspools in the immediate vicinity of hospitals being done away with, and that the building containing the closets and sinks be cut off from the hospital by a ventilated lobby.

That suitable lavatories, baths, and laundries be provided.

That the stair-cases and landings be in all cases constructed of stone.

That proper ranges and ovens be put up in the kitchens of every hospital, so that meat may be stewed and roasted as well as boiled, and a sufficient variety in the preparation of food may be afforded to the sick.

That the commission recommended to be appointed for the improvement of barracks be instructed to include hospitals in their operations.

That in future the vote for the building and repairs of hospitals should be separated from the vote for other military buildings, and that the estimate for the former shall pass through the office of the Director-General, and be by him presented to the Secretary of State, in accordance with the practice of the corresponding department in the naval service.

That in the case of items below a certain amount, and forming part of the annual estimate allotted for the repairs of each hospital, the purveyor be required to cause the repairs at once to be executed upon the standing contract made by the engineer without previous reference to that officer; and in the case of larger repairs which, though within the sum originally voted, require a special contract, the purveyor be empowered, under the authority of the governor or principal medical officer, as the case may be, to enter into such contract, subject to the approval of the engineer officer, both as to the terms of the contract and the sufficiency of the work executed.

That the standing contracts, in lieu of being made separately with different trades, should be made with builders who would execute the whole work through the various artificers employed by them.

That the duties of supply and account, in lieu of being divided as now between several officers and departments, be vested entirely in the purveyor, who shall provide the furniture and utensils of all kinds necessary for the use of his hospital, according to a list to be laid down in his instructions, keeping a certain reserve in store, and issuing without requisition to every patient all the articles prescribed in his instructions as necessary for the personal use of the patient.

That in all hospitals to which no governor is appointed, the purveyor be placed by his instructions distinctly under the principal medical officer of the hospital, whose orders he shall always obey; but in case of apparent extravagance either in quantity or quality, the purveyor shall report to the purveyor-in-chief, after obeying the requisition, in order that the case may be brought under the cognizance of the Director-General.

We recommend the adoption of revised diet tables with such alterations as may be thought advisable with reference to climate and other considerations, the object being to reduce the number of extras which require a requisition on the purveyor to authorize the supply.

We recommend the adoption of simplified forms of admission books, medical registers, monthly diet rolls, &c. &c.

We recommend the substitution, for the agglomerated regimental hospitals now in use, of a general hospital, with a suitable scheme of organization and government, in accordance with the preceding recommendations, at Dublin and Malta, or at such other stations as the Secretary of State may select, and that female nursing, under the limitations we have specified, be introduced into general hospitals.

We recommend that apartments be provided in military hospitals for the reception of officers for treatment at rates to be decided on by the Government.

Also, the creation of lunatic wards at the principal general hospital, as in the new lunatic hospital at Fort Pitt.

FIELD HOSPITALS.

We recommend that a fixed scale of equipments be laid down for the field hospitals for a battalion, a brigade, and a division.

That deficiencies or diminution of stock in this equipment be supplied on the requisition of the officer in charge of the battalion, brigade, and division, without counter-signature by any superior authority.

That all requisitions beyond the scale laid down should be countersigned before they can be available as vouchers to the issuer.

That hospital marquees should form part of every field medical equipment, and the bell tent never be resorted to for the treatment of the sick, except on the line of march, or on occasions when from unavoidable circumstances no better accommodation is attainable.

That a certain amount of horse and wheel transport be permanently allotted to the medical as to all other departments, and that the same rule be observed as regards sea transport, so far as the exigencies of the service will permit, with due regard to the wants of all other departments necessary to the administration of an army in the field.

That on the outbreak of war an officer of rank, chosen for his administrative powers, tact, and judgment, be appointed as governor of the general hospitals, who should be supreme on all matters of administration, and over all the departments whose co-operation is necessary within the hospitals.

That on the outbreak of hostilities immediate steps be taken to secure the necessary means of transport in properly fitted ships, with a suitable staff of attendants, for the removal to England of such patients in the general hospitals as may be equal to the voyage, and not likely to be soon fit for service in the ranks.

INSPECTIONS.

We recommend that the duties of inspectorial officers be defined by regulation, and that the regulations be printed for the information of the service.

RETURNS, REGISTERS, TABLES, &c.

We recommend the adoption of a form of monthly diet table, by which the necessity of re-writing every day a nominal list of every patient in the hospital will be done away with. And we recommend that all the regulations affecting the army medical service be revised, many having become inapplicable owing to the changes in the organization of the War Department, and from other causes. The sanitary directions which they contain are neither numerous nor specific enough, and pre-suppose a much

larger amount of practical sanitary knowledge than is usually possessed by most medical men, either in or out of the army. There are also no means provided whereby any recommendations, however good and appropriate, for securing the health of the troops can be brought into practical application.

STATISTICS.

We recommend that a nominal list of the deceased soldiers, and of births and marriages in the army, be communicated to the Registrar-General at such periods and in such a shape as may be necessary for the objects we have indicated.

That an improved nomenclature of diseases be adopted in the Army Medical Returns, and such alteration in the classification of diseases as may admit of an accurate comparison of them with other returns of a similar nature; and that provision be made for the periodical publication of the statistics of sickness and mortality among the troops.

That forms be prepared for the use of the medical officers, which shall enable the Commander of the Forces in the field to know what is the past and existing rate of sickness and mortality in his army, what are the causes of it, and for what time, at a continuance of the same rate, and with what reinforcements he can maintain his army in the field. These forms should besides enable the home authorities to compare the rates of the army with those of civil life and with its own rates at previous periods.

That the household brigade be directed to furnish to the Army Medical Board the same returns of sickness and mortality as the rest of Your Majesty's troops.

For the attainment of these objects we recommend the formation of a statistical branch in the Army Medical Department.

INVALIDING.

We recommend that men claiming pension not for disability but for length of service, and men labouring under palpable disability, be no longer required to attend at Chatham.

That the attention of commanding officers be drawn to the necessity of carefully recording the causes of any injury or disease from which men may suffer, and which may ultimately affect the amount of pension awarded to them.

EDUCATION OF THE ARMY MEDICAL OFFICER.

As regards the qualifications to be required of the candidates previous to examination, we recommend, that in all cases such certificate as would qualify a civilian to practise medicine as well as surgery should be exacted of the candidate, and that the examination should comprise some test of general education.

We further recommend, as regards both surgical and medical knowledge, the addition of a practical to a theoretical examination.

That this examination be competitive, and be entrusted to a body of practised examiners, as is now done by the East India Company, and we think it desirable that, if possible, one and the same board should conduct the examination for the medical service of the East India Company, the Navy, and the Army.

That after the first examination the candidates be sent to a military general hospital, there to go through a course of instruction in military hygiene, and in clinical military medicine and surgery, for which purpose the necessary professorial chairs, in lieu of the two now existing in Edinburgh and Dublin, should be instituted at the principal general hospital in England.

That during their residence at such general hospital all the probationers be accommodated with quarters, and shall receive such a rate of pay as may be sufficient for their subsistence.

That the course shall not be less than six months previous to an examination on the subjects of the course, on passing which the probationers shall be eligible for appointments as assistant-surgeons, and that, if possible, their first appointment be to a regiment.

That an examination in the practical knowledge of his profession as a military medical officer be passed by the assistant-surgeon before promotion to a surgeoncy.

That leave of absence be granted for attendance at hospitals and medical schools;

That medical officers be permitted to take private practice, under such regulations as may ensure attention to their military duties.

PAY AND RETIREMENT.

We recommend that the regulation which requires officers of the department, when promoted, to serve for one or two years on a lower rate of pay than that to which from their length of service they are entitled, be abolished.

We are of opinion that a considerable augmentation of the pay and retiring allowances, but especially of the former, is necessary to the interests of the service; but we must leave the adjustment of the details of pay of each rank to the Executive Government.

We are of opinion that the granting of a limited number of good-service pensions to the officers most distinguished by their zeal and efficiency is due to the department, and will act as a wholesome stimulus to its officers.

We consider compulsory retirement at 65 years of age for the inspectorial ranks, and 55 years of age for the executive ranks, to be absolutely necessary for the efficiency of the service.

PROMOTION, ROSTER OF SERVICE, AND RELATIVE RANK.

We recommend that the rank of first-class staff surgeon be abolished, and that regimental and staff surgeons now called second-class staff surgeons should after 20 years' service be styled surgeon-majors, with a small addition to their pay.

That the rule of seniority be strictly maintained in the promotion of assistant-surgeons to the rank of surgeons, except in case of incompetency or misconduct; and that no exception be made to this rule save for distinguished conduct, when the services for the which the officer is promoted shall be published with his name in the Gazette.

That the seniority be that in the army without reference to the station on which the officer to be promoted may be serving. That promotion to the ranks of deputy inspector and inspector-general be by selection for merit; and that, in the recommendation to the Commander-in-Chief, the Director-General shall state the position on the Army List of the officer recommended and the grounds of the selection.

That any confidential report by which the character of an officer is unfavourably affected shall be always communicated to him, and an opportunity given him of offering his explanation in defence.

We recommend the establishment of a roster of service, subject to this condition, that the amplest discretion be vested in the Director-General, to select for each station the principal medical officer whom he may think, from experience and character, likely best to discharge any peculiar duties which may attach to the medical charge of that particular station.

That the relative rank of the army medical officers be revised, and that it carry with it the same advantages as to quarters, allowances, precedence, &c. &c., as substantive rank, and that except in the case of the presidency of a court-martial, medical officers should sit on courts or on mixed boards according to their relative rank and the dates of their commissions.

That a limited number of medical officers of distinguished merit be styled honorary physicians and surgeons to Your Majesty.

That the Army Medical Department be held entitled to the same share of honours and rewards as combatant officers of the same rank.

That in the Army List the medical department should have precedence of the commissariat, and that their names should appear according to their rank, with the dates of their commissions, in the list of the regimental staff, and that the whole regimental staff be placed before the list of captains.

That a limited number of good-service pensions be granted to medical officers of distinguished service.

Lastly, that new regulations as to pay and retirements, promotion, rank, honours, and rewards, be embodied in a Royal Warrant for the regulation of the Army Medical Department.

CONSTITUTION OF THE ARMY MEDICAL DEPARTMENT.

We recommend that the Director-General should have three colleagues associated with him, selected for their eminence in medical, sanitary, and statistical knowledge respectively, and to be appointed by the Secretary of State for War. Those officers would act as the council of the Director-General, and should have the power of submitting any questions to the board, and of expressing their opinions in writing. All matters of routine would be referred to the head of the branch to which they belong, and only such matters would be subjected to the consideration of the council as are of importance. Minutes of all proceedings of the Council should be recorded by the secretary, but the Director-General, acting upon his own responsibility, might disregard those opinions if he consider it necessary, recording his reasons for so doing.

We recommend that the appointments on the council of the Army Medical Department should be held for five years, subject to re-appointment at the termination of that period, if the interests of the public service should require it; and that a similar regulation should apply to the Director-General, a longer period, however, being fixed for the tenure of his office.

We feel it our duty strongly to recommend a revision of the salary now attached to the office of Director-General.

With a view to give immediate effect to these recommendations, we beg to suggest, in addition to the Commission to inspect the barracks and hospitals, as already advised, the appointment of committees to draw up a scheme for the reorganization of the office of the Director-General; to frame a draft warrant regulating promotion; to draw up a scheme for the proposed medical school; to revise the regulations; and to arrange the basis and forms on which the statistics of disease and mortality of the army are henceforth to be collected and recorded.

CONCLUSION.

We have now stated the result of our investigations into all the subjects into which, by the terms of Your Majesty's Commission, we were directed to inquire. We have endeavoured to ascertain the causes of the fearful amount of sickness and mortality which year by year thins the ranks of Your Majesty's army. We have thought it our duty neither to conceal nor to extenuate the magnitude of those evils. We have traced some, at least, of the causes in which they have their origin, and we have specified the measures which, if adopted, would, in our opinion, tend to their removal.

We have endeavoured by the recommendations which we have made to raise the standard of attainment among those to whom the care of the health of the army is chiefly entrusted, and to direct their attention to the study of that sanitary science, on the proper application of which the prevention of sickness and the preservation of life in armies mainly depend.

We have endeavoured to place the medical officer in the position to which the dignity of his profession and the great services he renders justly entitle him, and to ensure to his advice and opinion that weight and influence in the administration of the army which are necessary to secure the health and to maintain the efficiency of the troops.

With the same object we have endeavoured to lay down rules for the future government of our military hospitals, which may simplify their organization, shorten the processes of business, and give a more efficient check upon expenditure, while they improve the quality and secure the regularity of the supplies, and relieve the medical officers of all non-professional duty, enabling them to devote the whole of their time and skill to the treatment of the sick.

Above all, we have endeavoured to secure the adoption of the measures necessary to place the barracks and hospitals of your Majesty's army in that sanitary state which is indispensable to the health of the sound and the recovery of the sick, and to the neglect of which the fearful annual mortality in the army may, in our opinion, mainly be attributed. We have specified the precautionary measures which it will, in our opinion, be necessary to adopt, at the outbreak of war, in order to guard against the recurrence of those gigantic evils which destroyed life, and may almost be said to have destroyed armies in former wars.

We have endeavoured, by proposing the formation of a statistical branch in the Army Medical Department, to secure that accurate and minute knowledge of the sanitary state of the army in every part of Your Majesty's possessions which may enable the Government to judge of the results of the measures taken with a view to promote the health and well-being of the troops, to become speedily acquainted with the causes of the sickness which may anywhere prevail, and to take such precautions and apply such remedies as enlightened sanitary and medical opinions may suggest. We feel confident that the periodical publication of these statistics will keep alive in the public mind a warm interest in the subject, and will strengthen the hands of the minister and of the military authorities in their efforts to remove from the ordinary conditions of the soldier's life those influences which now so fatally affect the health of Your Majesty's army. We trust that no time will be lost in applying effectual remedies to evils so

pressing ; and we feel confident that adequate support will be given to measures having for their object the efficiency and the well-being of that army which, whenever its services have been called for, has earned fresh claims to the gratitude of the country whose honour it maintains and whose soil it defends.

JA. CLARK.

J. R. MARTIN.

J. SUTHERLAND.

T. GRAHAM BALFOUR,
Secretary.

In subscribing this REPORT I feel it my duty to offer the following observations :—

1st. I cannot concur in the recommendation (Report, page lxxx.) that the rank of first-class staff-surgeon be abolished, unless I may understand that a deputy inspector-general of hospitals will be substituted for each staff surgeon who would cease to be employed, if the measure recommended be carried out. Nothing, however, in the Report appears to me to warrant an expectation of the kind, but rather that such is not contemplated, as I find it stated, at page lxiv., that the scale of pay proposed by Mr. Alexander, which is lower by 16,470*l.* than that put in by me, “presupposes the abolition of the first-class staff surgeoncy,” and there stops.

The duties now discharged by staff surgeons of the first class, cannot, I have reason to believe, after a close observation of nearly 43 years, be entrusted with advantage, or even safety, to the service, to medical officers who are not circumstanced as to be likely to act, in their official capacity, uninfluenced by regimental considerations or partialities, and are not departmentally superior to all regimental surgeons. General or other officers in command of stations, in advising with or consulting medical officers, find it desirable, nay, necessary, to their usefulness and efficiency that they should be unconnected with regiments, and often urge it as one among other reasons, for the appointment of administrative medical officers to stations not so supplied. If the measure proposed be enforced, considerable disadvantages will, I am satisfied, be experienced on home stations; but those will be far short of what will result on foreign ones, particularly on these where severe disease, in an epidemic form, often attacks the troops. On the latter stations, medical officers of standing, and of local experience of considerable duration, prove most useful, and confer benefits which cannot, to a certainty, be otherwise ensured; for even should some of the regimental medical officers in the commands possess the knowledge calculated to supply what is wanted, it does not follow that their advice will be obtainable at the moment it is necessary, as they move from place to place with their corps, and thus may be absent when the opinion of an experienced officer would contribute greatly to the interests of the service.

Further, the abolition of any one of the higher ranks of the medical department must, if it be effected without a full compensation, which is not proposed, affect most disadvantageously the interests of medical officers generally; and though this special circumstance may not, by itself, be considered a reason sufficient to prevent the measure being sustained, still I am bound, from my position, to claim for it the serious consideration of Government. Under existing arrangements, the proportion of medical officers of the senior ranks of the department is much below what it is in any other branch of the military service, there being in the engineers about, if not actually, 1 general or field officer with substantive rank, to every $4\frac{1}{3}$ inferior officers,—in the artillery, 1 to $5\frac{1}{2}$,* —in the commissariat 1 of the relative rank of field officer to every $6\frac{1}{2}$ of lower rank, —and in the medical department 1 of the relative rank of field officer to every 11 of inferior rank. Now, allowing this to be the case at present, what will it be in the medical department, if the rank of staff surgeons first-class be abolished? It will be 1 medical officer of the relative rank of field officer to 28 of inferior officers. It has, I have always understood, been held by supreme authorities a measure of policy, if not of justice, to allot a fair proportion of superior appointments to every public department; and I think no one will question the wisdom of the practice, as it is generally found there are, in every body of men, many of superior acquirements and talents, which they are ready to use energetically and beneficially, when they see some substantial advantages in prospective, to which they may aspire, but which they let slumber when no such incitements to activity exist. Medical men, I suspect, are in this respect constituted like other men, and therefore if what I have stated be not admitted as a reason why the recommendation should not be carried out, still I trust it will be allowed the consideration I think it should obtain, when fixing what compensation to the department should be granted, if the proposed change shall appear to be desirable and be practicable, without disadvantage to (the all-important point) the interests of the public service.

2ndly. I do not hold the opinion expressed at page lxxv., nor assent to the recommendation proffered at page lxxx., namely, “that the Director-General should have three colleagues associated with him” to act as his council, and that each of these colleagues should have the power to decide, independently of the Director-General, in regard of matters, which it is proposed shall appertain to his special branch; and that

* In computing the relative proportions I have not taken into account the officers of the engineers and artillery who have brevet rank, viz., 27 of the 131 captains of the former, and 80 of the 271 of the latter; for these I have assumed the medical department will, in the surgeon-majors it is proposed to establish, have, if not an equivalent, at least a partial compensation.

only such matters of importance as either involve changes affecting the welfare of the service, or otherwise, would be subjected to the consideration of the Council. I know, from considerable experience, that the Minister for War and the Commander-in-Chief, not to say the public, hold the Director-General responsible for all official advice or decisions which emanate from his office, and therefore I feel he should give consideration to almost every document which reaches it, as generally each requires to be judged of and decided on its own merits instead of in accordance with established regulations or practices, as is the case in matters of routine.

I fully appreciate the advantages which are to be derived from an interchange of views, and in consequence I had, as I acquainted the Commissioners, often sought, since I was appointed chief of the department, the individual and frequently the conjoint opinions of the medical officers detailed for duty in my office, and on some occasions had even gone further. The plan I have followed, and which I continue to observe, is, I am convinced, the best calculated to secure the end desired with the least interruption and insecurity to the Director-General, and risk to the public service.

3rdly. I consider that the service and the sick soldiers will suffer if a military commandant be appointed as governor to each general hospital; and further, that the *status* of the officers of the medical department, more especially the seniors, will thereby be disadvantageously affected, in fact the latter more particularly will stand lower than they do at present, a circumstance which must operate injuriously, considering that "in the military service, rank," as the Commissioners truly observe in their Report, page lxiii., paragraph 4, "is everything; there exists no authority without it," &c. The governor of a military general hospital should, I think, be a senior medical officer who has shown himself a skilful administrator, and possessed of a thorough knowledge of all that is necessary to the well working of an establishment appropriated to the reception of sick, and should be armed with full power to order whatever he shall consider necessary, and be only responsible, except in purely military matters, to the Minister for War and the Director-General, from whom he should receive his instructions.

I do not deem it desirable to instance what I have, during the early part of my service, when commandants of hospitals were employed, known to happen; nor would it in my opinion be wise to adduce here all my reasons for holding the opinions expressed in this memorandum; still, I am ready to furnish them, should they be exacted.

A. SMITH, D. G.

MY DEAR SIR,

Wilton, December 31, 1857.

I HAVE received from our Secretary your protest against certain recommendations contained in our Report, and which, in justice to yourself, should appear in the page next after the signatures of the Commissioners. I have given directions accordingly.

You will find, by reference to Mr. Alexander's evidence, that he proposed to appoint additional deputy inspectors in lieu of first-class staff surgeons wherever inspection is really required; and in his estimate for the future pay of the Army Medical Department he allowed for a certain increase in that rank.

At the same time I must confess that I entertain the opinion that the army medical officers are over inspected at present, and that the responsibility of the executive officers, and the interest in their profession which attaches to responsibility, is thereby weakened.

As regards the proportion of medical officers ranking as field officers, we propose that all surgeons of 20 years' service shall rank as field officers, with increased pay and with the title of surgeon-major. The proportion of field officers to the inferior grades will then far exceed the proportion in the line, whom you omit to notice in your comparison with the army.

In recommending the formation of a council, who are to assist the Director-General by their advice, but to be invested with no power of voting, our object has been to fix responsibility on one man and on one only, but to secure to him, before his decision is given, the advantage which results from hearing the opinions of others, so that the matter under discussion shall have been presented to his consideration under all the aspects in which it can be viewed; at the same time business of a mere routine character will be expedited by its allotment to the heads of each department, under such regulations as shall ensure to the Director-General an acquaintance with all the current transactions of his office.

As regards the appointment of a governor to general hospitals, the majority of the Commission are, I conceive, of opinion that it is derogatory to the dignity of the medical profession, while it is a waste of the highest description of skilled labour, to impose upon

the army medical officers what are termed duties of administration, which are the duties performed in civil hospitals by a matron, a nurse, and a house steward. The medical officer has a right to have every appliance found to his hand by functionaries whose special and sole business is to provide them; and the experience of the late war has shown how necessary it is to vest in the hands of some officer full authority over all the various subordinates charged with supplying the material wants of the hospital, and upon whom should rest the sole responsibility that everything is provided which is necessary to the comfort of the sick, or which, in the opinion of the medical officers, is requisite to secure to their treatment the best chances of success. I have made these remarks, wishing to put on record my continued adherence to the recommendations, and my dissent from the objections which you have on your side very properly and very fairly stated, and to which your official position gives additional weight.

Believe me, faithfully yours,

To the Director-General of the
Army Medical Department.

(Signed) SIDNEY HERBERT.

MINUTES OF EVIDENCE

TAKEN BEFORE

THE COMMISSION APPOINTED TO INQUIRE INTO

THE

REGULATIONS AFFECTING THE SANITARY CONDITION OF THE ARMY, &c.

Wednesday, 13th May 1857.

PRESENT :

The Right Hon. SIDNEY HERBERT, M.P.
A. S. STAFFORD, Esq., M.P.
Sir H. K. STORKS, K.C.B.
Dr. ANDREW SMITH.
T. ALEXANDER, Esq., C.B.

Sir THOMAS PHILLIPS.
Sir JAMES CLARK, Bart.
J. R. MARTIN, Esq., F.R.S.
Dr. JOHN SUTHERLAND.

PRESIDENT, the Right Hon. SIDNEY HERBERT, M.P.

Dr. ANDREW SMITH, examined.

Dr. A. Smith.

13 May 1857.

1. (*President.*) You are Director-General of the Medical Department of the Army?—I am.

2. Will you state what course is taken by young men who are desirous of entering the Army medical profession?—Any gentleman who is desirous to obtain an appointment in the Medical Department of the Army makes known his wish either to the Commander-in-Chief or to the Director-General of the Medical Department,—generally to the latter. On the receipt of any such communication, a schedule is forwarded to the applicant, of which this is a copy (*the same being handed in, see App. No. I.*), by the Director-General, together with directions to enter in it a statement of his professional education, acquirements, testimonials, &c., and then return it to the Office of the Army Medical Department. On its return, the document is duly examined, and if it is ascertained that the candidate has had the education required, and is in possession of a diploma in surgery, either of the Royal College of Surgeons of England, Dublin, or Edinburgh, or of the Faculty of Physicians and Surgeons of Glasgow, or of Trinity College, Dublin; and, further, that some person of standing in society, not of his own family, certifies or is prepared to certify to his respectability, and moreover to his being of steady and regular habits, then his name is recorded as a candidate, and he is informed that his wish will be considered as opportunities arise. If on the contrary the returned schedule does not show him to have the required qualification, he is told so; his deficiencies are specified, and he is informed that in the event of his afterwards attaining what he wants he may report to that effect should he still desire to obtain an appointment. The applicants who possess the highest qualifications are of course considered the most eligible when vacancies arise; therefore when an appointment is to be conferred, the candidate who is considered likely to render the best service is informed that he must proceed to London for examination, and must observe the instructions contained in the printed schedule. If the examination of the documents, certificates, &c. which he is required to produce prove satisfactory, he is then subjected to a professional examination by a Board composed of myself and two senior officers, and if the replies given to questions put verbally and in writing prove him to be well qualified to discharge the duties which are required

of an Army medical officer, he is then selected for temporary service in the General Hospital at Chatham. In this hospital his capabilities are further tested by placing him in charge of sick, under the superintendence and direction of a superior medical officer; and while he is at Chatham he is from time to time reported upon by the principal medical officer of the establishment, and the staff surgeon of the division in which he serves; and if these reports are in his favour, he is, when senior there, recommended to fill any vacancy which may occur, and in course of time is gazetted to a commission in the Service. During this probationary period he is required to show his knowledge of disease and its treatment, his efficiency as an operator on the dead body, his aptitude for describing disease, as ascertained through the medium of periodical reports on the cases he may have treated; and, in addition to that, he is required to become acquainted with the regulations of the Service, the compiling of returns, more especially of those which are required from regimental medical officers. I may state that there are other things which I had nearly overlooked,—for instance, he is also required to make post-mortem examinations. Each candidate at Chatham takes it in turn to make them. All the medical officers of the establishment must be there at the time; perhaps twenty are assembled in the dead-house, and the one who has to make the post-mortem examination is required to proceed, while the one who is to make the next post-mortem examination stands by to record what the operator observes; he then describes the state of the body with regard to the emaciation and the general appearances, all which are recorded by the gentleman standing next to him; he then proceeds with the examination, first opening one cavity and then another, and describing everything that he sees in the cavity,—all which is recorded by the gentleman standing near him. I should also state that the gentleman who is appointed specially to superintend the pathological branch of the establishment is also standing by looking on and watching how he describes, in order to see that he reports correctly. If he does not describe the appearances correctly, he is immediately stopped by this gentleman who is standing by, and his attention is called to the points which he may either have overlooked or have improperly stated, and he is made to

Dr. A. Smith.

13 May 1857.

go over the parts again until he states them correctly; besides that, candidates are instructed in the application of splints. There is a stuffed figure, about as large as a man, or half as large again, and on this figure he has to apply all kinds of splints that may be necessary to apply to the living body,—he has also to apply bandages and various contrivances of that description, in fact to do everything that can be done on a figure of that kind, in order that he shall become proficient and understand exactly how to act in case he has to apply the same upon the living body. These are the principal instructions which he receives while at Chatham as a candidate; and upon his efficiency in doing all these things depends his appointment, inasmuch as I am made aware of the efficiency of every man by the reports to which I have referred from the principal medical officer.

3. Do you ever reject these candidates after the course at Chatham?—Yes.

4. In what proportion?—Not in any great proportion, because they have been pretty well tested before they go there, and it very rarely turns out that they are inefficient. While I was at Chatham, there were three rejected; but that was not on account of deficiency of professional knowledge, but it was in consequence of irregular conduct. I do not recollect any one who was so deficient in professional skill as to render it justifiable to reject him. For many years the candidates awaiting, at Chatham, commissions were required to support themselves, without any pecuniary assistance from the Government; but whilst I was there, as principal medical officer, I so frequently represented the hardship of the practice, and showed that, generally speaking, a great part of the professional duty was discharged by unpaid persons, that, in the end, the Government consented to allow the three seniors to receive six shillings per day, and the allowances of an assistant-surgeon. By this concession, a grievance, which had been deeply felt both by the candidates and myself, was partially removed, and even those who were not receiving pay ceased to complain, feeling that they in their turn would reach within three of the top. In future it will be necessary to revert to the course described, unless some further alteration be effected. During the war it has not been so; they were never kept there a sufficient length of time; they were gazetted from the day they went to Chatham, which was an exception to the rule. When the examinations were as described, a standard was established, and all candidates who did not come up to it were rejected; the rejections were from two to three annually, and were generally in consequence of defective information in regard of Latin, or of subjects on which some of the Colleges do not, or at least did not then examine. During that time (up to the commencement of the late war) every possible effort was made to secure eligible candidates, and many of the public schools were entrusted with the power of recommending one or two yearly for commissions, provided they did so after having subjected those who desired them to a competitive examination. This plan was carried on with considerable vigour, and with advantage to the public service, by the College of Surgeons of Edinburgh, but not to the same extent by any of the other professional bodies, and through the intervention of the former College some of our very best recruits were obtained. I extended it myself considerably when I came to be the head of the department, and I offered further opportunities to these public bodies to send the names of men who might compete and were considered highly qualified. Since the termination of the war, a competitive examination has been introduced as the rule of the service, and no commissions since have been granted but to men who have been selected after such a test. At first the plan appeared to answer, but now there is reason to fear it will not be possible to continue it, as a sufficiency of candidates do not offer to admit of the vacancies being filled by gentlemen whose qualifications are above the average. It is much to be desired that the plan be

continued, and I think it will be practicable if the pay and advantages of those who take service be increased; if it be not, the army will in future be under the medical charge of inferiorly qualified men, as all the superiorly educated and talented will seek employment either in the East India Company's service or in private life, where their capabilities will ensure for them a remuneration much beyond what is offered to army medical officers. The time, therefore, has arrived when the Government and the country must either pay more liberally or trust their troops to the medical charge of practitioners of inferior abilities and acquirements.

5. Is that course invariable at Chatham, which you mentioned, of instruction being given pathologically, that is, on the examination of the dead body in the presence of so many persons?—Invariable; at least it was so during the three or four years that I was principal medical officer. I saw it take place. I have heard that individuals have said it was not so. Whether it is so on all occasions now I cannot answer but I know that there is a strong regulation to that effect; and if it is not practised it is the fault of the principal medical officer, who will be answerable for a breach of the regulations if he does not enforce them.

6. In the evidence of Mr. Agnis, Assistant Surgeon in the 3rd Light Dragoons, before a Committee of the House of Commons last year, he says, at page 213:—“Will you state what length of time you remained at Chatham?”—“I was at Chatham only six weeks.” “What supervision was there at Chatham?”—“There was the supervision of the principal medical officer, who had charge of the whole of the arrangements of the hospital. The hospital was divided into a medical and a surgical division; each of those was in charge of a staff surgeon of the first class, assisted by a staff surgeon of the second class; then in charge of each assistant was a medical candidate of similar standing to myself, who prescribed for the patients, subject to the veto of the staff surgeon of the first class in charge; he applied the dressings and bandages, and did all small operations of that sort; the staff surgeon visited the wards every day, and approved of or corrected the treatment of the medical candidate as he thought fit.” “What was your examination on entering the army medical department?”—“A general one,—rudimentary,—similar to that to which I had previously been subjected at the College of Surgeons and at Apothecaries Hall in some particulars.” “In what particulars did it vary?”—“I was asked one or two questions concerning tropical diseases, such as tropical fever and dysentery.” “Was it entirely *viva voce*?”—“It was not *viva voce* at all, it was on paper.” “Had you any drugs shown to you for examination?”—“None.” “Had you any subject shown to you for dissection?”—“None whatever.” “What was the amount of your required attendance in the hospital at Chatham?”—“Every candidate had to attend the hospital at 9 o'clock, and he must remain in his ward from 9 till 11,—from 11 till 1 he must still remain within the hospital walls, but not necessarily in the ward under his care; he again visited the patients some time in the evening between 7 and 9.” “Was that all?”—“That was all his professional duty.” “What supervision was there over you, except in hospital hours?”—“I am not aware of any.” “There was none?”—“As far as I know, none.” “Were you required to attend any lectures at Chatham?”—“None at all, there were no lectures to attend.” Is this a correct description of the practice?—That would refer rather to the examination in London; but I must also observe that the appointment of Mr. Agnis took place during the war, when it was impossible to adhere to the letter of regulations. The course of proceeding I have described is that followed under ordinary circumstances; but war is an exceptional case, and the demand for medical officers was so great and required to be so immediately met, that it was quite impossible to

Dr. A. Smith.

13 May 1857.

adhere to routine. I shall put in a detailed statement by an officer of the department of the system followed at Chatham.

7. There is a written regulation to that effect, that they are to go through this course at Chatham?—Yes. I will put in the regulations.

8. (*Mr. Martin.*) It is a matter of order in the service?—Yes; it is an established regulation, and if the principal medical officer does not enforce it he is amenable.

9. It is a matter more of practice than of regulation?—It is the practice.

10. In your preliminary examination do you inquire into the acquaintance of the young candidates with sanitary science?—Occasionally questions are put, such as with regard to the outbreak of disease in a barrack, what steps would he pursue, &c.

11. Is such acquirement imperative or permissive?—I cannot say exactly, but I dare say that scarcely any examination takes place that some questions are not asked in regard of sanitary science.

12. Is it not his first duty to be informed in sanitary science?—It is certainly a most important part of his duty.

13. But is not the cure of disease held, in the profession, to be subordinate to the prevention of disease?—It is most important certainly to prevent disease.

14. Is the young medical officer trained for the sanitary duties of the service, previously to taking charge of a corps or a detachment abroad or at home, instructed in sanitary science?—I cannot tell exactly whether he is trained and instructed in sanitary science or not before he enters, but he is trained in all matters connected with the discharge of the duties of his profession, and goes to Chatham for that purpose. He learns, for instance, that free ventilation is necessary, and what is the best kind of ventilation to adopt; he also learns the necessity for separating infectious diseases from non-infectious diseases; he also sees and hears what is the best way of doing that.

15. Is that left to the schools in civil life, or are there any measures taken under your directions for his special sanitary instruction in any hospital?—There is no special teaching of that kind.

16. But nowhere, I apprehend, is that made a matter of special regulation under any particular officer?—No; it is no more a matter of special regulation in the medical department of the army than it is in the East India Company's service or in the navy.

17. (*President.*) You spoke of the pathological instructor at Chatham, in whose presence these operations are performed. Is he a permanent officer?—We have no officer that we call a permanent professional officer, except it be the head of the department. All other officers of the department of every rank are sooner or later liable to be moved; for instance, the present curator, who is now at Chatham, was there for about eight years, when he got dissatisfied, as most other men do, for it is a very dirty disagreeable duty, and when a man finds that great advantages do not result he gets tired of his position; this gentleman got tired of it, and obtained a surgeoncy in a regiment, and went to India; after he returned to this country, some time ago being desirous of getting on to the Staff again, he was appointed to it, and has been restored to Chatham.

18. There is certain instruction given at Chatham, whether in sanitary matters or otherwise, up to a certain extent. Is that instruction given by whatever officer happens to be there by the chance of rotation, or is it an officer selected for his competency for that particular duty?—He is an officer selected for his competency.

19. And does he remain there a sufficient time?—Yes; Dr. Williamson remained there for eight years,—he was one of the most competent anatomists and best operators that I know of anywhere.

20. What do you call him in his office?—He is called the Curator of the Museum.

21. Are the post-mortem examinations put upon record?—They are recorded, as I have stated, by the

gentleman whose turn it is to make the next post-mortem examination.

22. What use is made of these records afterwards?—They are kept in a book; every post-mortem examination is recorded in that register.

23. If there should be anything remarkable or important in a scientific or medical point of view, are the facts published?—A catalogue is published with descriptions of all the preparations in the museum, and in what respects they are particular or remarkable.

24. (*Mr. Stafford.*) But you do not publish the details?—No; they are not published as a matter of course; but they may be published if an individual wishes to publish a paper on a certain subject and he avails himself of what the Necrological Register supplies.

25. (*President.*) You take, do you not, diplomas from the College of Surgeons in London, and from Edinburgh and Dublin?—Yes.

26. Do the diplomas of the College of Surgeons in each of those three places mean the same thing?—No.

27. In Edinburgh and in Dublin the diploma covers more, does it not, than the London diploma?—Yes.

28. It includes in those places what the London diploma does not?—In Edinburgh I believe it includes much more; I do not know exactly what it does in Dublin. The Edinburgh one includes materia medica, chemistry, and the practice of physic.

29. When you take the diploma of the London College of Surgeons, do you exact something equivalent to the diploma of the knowledge of materia medica and chemistry?—Yes; we examine in materia medica and chemistry. In many instances where candidates were rejected it was upon points on which they are not questioned by the colleges; for instance, on materia medica, or chemistry, or Latin. I think that we have rejected more men on account of their almost total ignorance of Latin than on account of any other deficiency. No colleges examine in Latin except for degrees.

30. Do you supply to the army medical department that which is wanting in the London College of Surgeons diploma?—Yes; we examine on chemistry, materia medica, pharmacy, midwifery, and Latin.

31. Is there a different examination for a young man who comes with a London diploma from that which another would undergo who came with a Dublin or Edinburgh diploma?—No; we give them the same. We go through the whole; we do not take anything for granted from any college.

32. Are there written questions as well as *viva voce*?—Yes, there are both.

33. (*Sir Thomas Phillips.*) Are the questions printed?—Yes, they are now.

34. You can probably lay them on the table?—Yes.

35. (*President.*) When do you print them?—I print them two days before an examination.

36. (*Sir James Clark.*) Have you any practical examinations?—Yes, at Chatham. Here there are no means for it.

37. Is it not very desirable that young men should be examined practically before they enter the service?—They are for three months at Chatham, on probation.

38. I think you stated that they were not there invariably for three months?—I said that during the time of the war they were not there two days sometimes; but that prior to that they were often there for three months.

39. (*Mr. Martin.*) Is the young medical officer taught to examine recruits?—Yes.

40. And to determine their relative fitness for the several arms of the service, such as Infantry, Cavalry, and Artillery?—Yes.

41. Does he receive instructions respecting their accoutrements, clothing, &c., as applicable to the various climates in which he may serve?—There is an established dress. He is taught what is the dress for a warm climate and what is the dress for a cold climate.

Dr. A. Smith.

13 May 1857.

42. Is he instructed as to the diet which is best suited to the several climates in which the soldier serves?—I should, perhaps, say too much if I said yes to this question. In the course of service, the attention of the young officer is directed to all these points, and he is told that when they go to a warm climate such and such food is prejudicial, and such and such food is advantageous, and so on, but I cannot say that there is any special course of instruction.

43. Is he instructed at Chatham?—No, I do not think that he is.

44. Does he receive instruction with regard to the construction and arrangement of barracks and hospitals, or as to the details of hospital expenditure?—With regard to the latter part of the question, he is; but as to the construction of hospitals, that is never left to the doctors.

45. But as regards the sanitary condition of the occupants of hospitals, does he receive any instruction?—Yes; he knows that a certain number of cubic feet is desirable, that there should be a certain number of windows in a room, and so on; but as to the construction of barracks or hospitals he receives no instructions.

46. (*President.*) Are there any recorded regulations as to the number of cubic feet which it is necessary to allow for each patient?—There are in the barrack regulations.

47. (*Mr. Martin.*) Does there exist, for the use of the young medical officers, any manual of sanitary science?—None.

48. Does it occur to you that such a work would prove of great utility to young medical officers?—Decidedly; and with reference to that question I may say that I have long had the intention, but my official duties have not given me time to do it, to get up a manual for the medical officers of the army in general, a medical guide for military medical officers, arranged under different heads, each subject being treated under its own head; such a work as that ought to exist.

49. (*President.*) There is the work of Sir George Ballingall?—Yes; that is what he calls military surgery.

50. The hospital regulations, I suppose, were never submitted to medical officers for revision on sanitary points?—No.

51. (*Mr. Martin.*) If a medical officer be deficient or altogether wanting in hygienic knowledge, as to his duties in the army, can he in after life acquire such knowledge, except at the cost of the soldier's life and health?—Yes, I think he can, because as long as he is an assistant-surgeon he is not responsible for a garrison, or for the healthiness of a garrison,—he learns while in that garrison what is necessary.

52. But on active service may it not happen that a very young man, with a very deficient knowledge, may have an independent charge in consequence of casualties amongst his superiors, and may not then his want of knowledge in sanitary science prove very injurious to those who are under his charge?—That would rarely happen; and if he were totally devoid of sanitary knowledge it certainly would prove injurious. I am almost prepared to say, with regard to the majority of our assistant-surgeons, that if they were brought here and asked about sanitary science, they would give very good answers to the questions; and I think that, generally speaking, the whole of the Army Medical Department are perfectly aware of what is necessary in a sanitary point of view. I only fear that they can do little in that respect; power does not rest with them.

53. But they can always make suggestions?—Yes; but a person gets tired of suggesting, especially when he finds that his suggestions meet with no consideration.

54. (*President.*) Do you recollect a letter that was written in November 1854, by Dr. Menzies, from Scutari?—I do not know what letter you refer to.

55. I refer to his report sent home as to the state of the hospital, in which there was nothing very unfavourable to report, and yet the sanitary state of the hospital was very bad?—Yes.

56. If that report had come home, and had spoken strongly of great deficiencies of space and bad drainage, and want of ventilation, and great sanitary defects generally, some steps would have been taken from home, probably, to remedy them?—If a strong report had been sent home, and one had not been led to believe that there were local authorities on the spot to remedy those defects, I should have applied to the Minister for War, but as no report of that kind came I did not do so. The first report was from Dr. Burrell, and the tenor of that report was that everything was in good condition, save and except the drains and the privies, and that they were negotiating for the purpose of doing something in respect of them.

57. Do not you think that these good reports, coming from two separate officers, showed that their attention had not been in their previous practice sufficiently turned to questions of sanitary prevention?—No. With reference to Dr. Menzies, he was over-pressed with work, and hardly knew what to do first, and consequently we must expect that some matters would be overlooked.

58. They were not overlooked, but he gives an acquiescing kind of opinion, and speaks of the state of the hospital as not being so very bad, but alludes to one or two small things that ought to be remedied?—He reported the chief defects, which were the drains and privies.

59. It appears to me that there is a want of theoretical sanitary instruction, which ought to be given to the young men before they enter upon their practical duties?—I think before you could fairly come to this conclusion, it would be necessary to ask more officers with regard to sanitary measures what they consider to be necessary, and if Dr. Menzies was brought before this Commission and questioned, I daresay he would tell all that is necessary to be done, and even what was necessary at that time.

60. You are anxious, no doubt, in every way to improve the status and qualifications of the young men in your department, would it not be a great advantage if there were opportunities given for sanitary study to a very young man at the commencement of his career?—Decidedly, and it is what I should recommend, because it is better that they should at once acquire that knowledge, than have to acquire it afterwards.

61. (*Dr. Sutherland.*) I understand from you that there is no special examination on sanitary matters?—Not entirely on sanitary matters. There is none separate from the general examination, but the general examination embraces, I do not say always, but I believe generally, questions on sanitary points.

62. (*Sir Thomas Phillips.*) I see that there is no department, if I may use the term, for sanitary subjects?—No.

63. (*President.*) It is included in the course given by Mr. Tufnell in Dublin, and the late Sir George Ballingall at Edinburgh, is it not?—Yes.

64. You have no professor giving similar courses in London?—None.

65. There are two classes of candidates who come to you, one who have and another who have not gone through a course of military hygiene, including sanitary instruction?—Yes.

66. And you give a different examination to them, do you not?—No; we do not make any difference as to Dublin or Edinburgh in that respect; we put questions to all. I may remark that we have no proof that a young man has attended the course of Dr. Tufnell, or at least attended it regularly, therefore we ascertain from him whether he possesses the knowledge or not.

67. (*Sir James Clark.*) Is it your opinion that military surgery or military hygiene could be better taught after a candidate has entered the service or before, or whether professors of military surgery at the schools would be useful?—I think we ought to have a school at the chief general hospital of the kingdom, where there ought to be always a number of candidates studying their medical duties, as connected with

the army, in order to fill vacancies as they arise: as one is removed his place should be immediately supplied by another.

68. For what period of time would you have the probationers remain?—For twelve months; and I may mention what I believe is in contemplation, as Lord Panmure has agreed to have a number stationed at Netley. I have given in a plan in which I have shown the quarters for medical officers, and I have estimated for forty juniors.

69. (*President.*) Do you contemplate doing away with the external military professors at Edinburgh and Dublin?—I never considered that. That is a political question. As long as I have a school at Netley I do not care what is taught elsewhere.

70. How is it a political question?—I say political, because I believe it has been pressed on the Government by Members of Parliament who have represented Dublin and Edinburgh.

71. (*Sir James Clark.*) Setting aside the political question, what is your opinion upon the subject?—I would say that we do not want them.

72. You think that diverting a young man from the regular progress of medical study to go into that which he has to learn afterwards is a loss of time?—Yes; I should say that there is no necessity for those two chairs.

73. You would have first-rate men down at Netley to give instruction on military surgery?—Yes, and on the best means of maintaining the health of armies in the climates of the different countries where troops are to serve, and the special diseases of such countries, &c.

74. (*President.*) You contemplate moving the whole thing bodily?—Yes; having models of all kinds of waggons that have been used or are used, and every kind of appliance used to carry sick and wounded men. There is to be a large establishment containing a model of every kind of invention.

75. You contemplate establishing at Netley not only a large general hospital, but a medical school for candidates?—Yes.

76. (*Mr. Alexander.*) Will you have models of barracks and hospitals?—Yes, as far as it may be practicable.

77. (*Sir James Clark.*) Do not you think it would be necessary that there should be practical examinations before going into the hospital at Netley. I presume you are aware that in the East India Company's service no one is admitted without undergoing a practical examination?—No, he would be submitted to that at Netley before being recorded as an eligible candidate for a commission.

78. Do you not think that without something like that the character of the medical officers of the army will sink in the estimation of the public?—I do not think so. If we can get men who can answer the questions that we put to them, and further, pass the ordeal to which they will be subjected at Netley, I do not think we need fear.

79. You say that you are the examiner, and two other medical officers?—I and three, now.

80. You have a doubt, have you not, with regard to the competitive examination being continued?—Yes, I do not see any chance of being able to continue it. I want twenty-seven men now, and I cannot get that number to come forward.

81. Have you not as many candidates as there are vacancies?—No.

82. You maintain an absolute standard in your competitive examination?—Yes; but I do not want to return to the standard if I can help it. I wish to keep up the competitive examination; though I fear it will not be practicable, as eight candidates have withdrawn since the questions put at a late examination were published.

83. Why?—I suppose they thought they were too severe.

84. (*President.*) They could not be too severe if

they knew what they were?—But they did not. I do not put forward the questions that are to be asked at forthcoming examinations.

85. (*Sir James Clark.*) In competitive examinations, do you not consider it essential that the examiners should be capable of examining candidates in the latest improvements and discoveries in medical science—that only men occupied in teaching one progressive science, physiology, pathology, &c., are fully competent to examine our more advanced medical candidates?—I am much disposed to think that the officers who examine in my office are qualified to ascertain all that is necessary, considering each candidate examined is possessed of a diploma, as stated. The time which is required, when the examinations are competitive, cannot be spared; therefore, if such are to be continued, it will be my duty to represent to Lord Panmure the necessity for employing other officers. The last examination occupied myself and three other officers for nearly six days.

86. (*Mr. Martin.*) Such being the case, do you not think that special examiners, men of approved science in medical life and teachers in great institutions, would be the more fit examiners?—It might be desirable to have such examiners, but I cannot admit it to be necessary on account of the incapacity of the army medical officers.

87. (*President.*) Upon the same principle as prevails in the civil departments now, where I believe they employ a foreign body of examiners so that there shall be no suspicion of favour or partiality in the department itself?—Yes.

88. (*Sir James Clark.*) Is there any second examination for promotion in the army?—There is a rule to that effect, which has been long in abeyance, as the practice created much dissatisfaction in the department generally, but more especially amongst those who were reported highly qualified, and who, notwithstanding, did not obtain the promotion they expected.

89. Should it not be the general rule that there should be a second examination?—If such a rule were again to be enforced, I expect the same feeling would result. For years past the annual reports of medical officers have been considered as, in some degree, calculated to supply what it was attempted to obtain by periodical examinations. If promotion were to be given by selection, these reports would, if the office establishment was sufficient to admit of their being fully examined, afford great assistance towards forming a correct estimate of the capacity and acquirements of medical officers.

90. You are aware, are you not, that in the navy there is an examination for assistant-surgeons before they are promoted to be surgeons, and that they are obliged to come home and attend to practical anatomy before that examination?—I am not.

91. Do you see any objection to a Government board of civilians for examination of medical candidates for both the navy and the army at the first entry, After that examination each would go to his respective service, and if a second examination were required then it would be for the medical officers of each department to examine them, and they would have to examine them on the duties they would have to perform in their respective departments in the army or in the navy?—If I were to answer with a view to my own comfort, I should reply no; but, as I feel it my duty to have regard to the interests of the service, I am compelled to say I would wish to see candidates undergo some examination by army medical officers, and, if possible, in presence of the Director-General. I have no objection to an intermediate examination being held by a board of civilians.

92. If the chief officer or anyone appointed by him was present at the examinations, would that be satisfactory, or will you state whether there would be any objection to it?—I would rather that the chief officer

Dr. A. Smith.

13 May 1857.

Dr. A. Smith. should be present at the examination by the board of army medical officers, whether that might be in London or at the chief general hospital of the kingdom. I think this examination to be necessary to prevent its being supposed that the senior officers of the department are incompetent to test the qualifications of those who desire to serve in the army.

13 May 1857.

93. (*President.*) That would not be the case if you apply the same rule both to the navy and to the East India Company, as it would be forming one board for the purpose of examination?—I fear it would be the case, both as regards the army and navy. In the case of the East India Company it would not be so, as there are no Company's officers in England available to form a board; further, I think the head of the department would lose a favourable opportunity of acquiring some important information in regard of individual character.

94. But that he might still do, might he not?—Not unless he sat with the Board of Civil Examiners.

95. Do you see any objection to it on this ground; if the examination must be still confined to civil surgery and medicine, it would exclude the subjects which you now include in your examination, and which are peculiar to the military service?—No; if the Board of Civil Examiners could make it convenient to sit on days and at hours when he could attend.

96. (*Sir James Clark.*) It would be a body placed between our numerous institutions and the public service, and their examinations would tend to raise the character of the colleges?—I do not know what effect it would have on the colleges; nor am I prepared to venture an opinion as to how far it would benefit the army medical department.

97. Suppose you found him to be ignorant, not knowing how to feel a pulse or to bleed a man?—Of course he must learn or be rejected.

98. Then why not ensure that he learns that beforehand?—We do. He has a period of probation at Chatham; and should he, while there, be found incompetent, he is not commissioned.

99. But your knowledge comes too late, does it not?—No; because the candidate is not appointed.

100. (*Mr. Martin.*) Returning to the question of the preliminary examination, do not you apprehend that the circumstance of there being eminent teachers in the profession in civil life, is owing to the immense competition which exists, and that such men are more competent to conduct such an examination than the average body of medical officers in the army or the navy?—They must doubtless be more competent to test the extent of scholastic knowledge possessed by candidates. The examinations conducted in my office have had more reference to practical points which will be seen by reference to the series of questions which now lie on the table, and which constituted part of those which were put to the gentlemen we last examined.

101. There is no wish, I can assure you, to under-rate the men in your office, but an examination of that kind is not equal to a board who methodically set to work.—Our board works methodically, at least to a certain extent, and what is not completed by us is accomplished at Chatham; if we had no place to practically test candidates, that certainly would require to be done in London.

102. (*Sir Thomas Phillips.*) Suppose you had that which I understand you contemplate, a good set of professional medical teachers at Netley, would they hereafter supply you with the means of forming a board, jointly with any other authorities who might be selected, very competent for the preliminary examination?—Certainly.

103. Would it not be desirable in your judgment in that case, to use them for that purpose?—Yes.

104. (*Mr. Martin.*) Do not you apprehend generally that both the theory and the practice of medicine and surgery and the cognate sciences, are kept up at a higher pitch in civil life than in the public services, owing to the active and excessive competition, and the opportunities which exist for improvement? Is not

that fact generally admitted amongst ourselves?—To a considerable extent it is so, and I feel it will be so until we improve the position and increase the pay of the army medical officers, and make them feel that the treatment they experience requires exertions on their part, which I suspect they do not feel disposed to make under present circumstances.

105. You would encourage them by pay and promotion?—Yes.

106. (*Sir Thomas Phillips.*) Is the present Board of Examiners constituted by any minute?—No; at least I know of none; it has always been the practice for the Director-General and two senior officers to constitute the examining board; since the plan of competitive examinations has been adopted it has been the Director-General and three senior officers.

107. Are they always persons filling the same positions, or are they persons selected by the Director-General?—The Director-General and his professional assistant are always two, and the next in seniority in the office, if competent.

108. I understood you to say, with regard to the character of the instruction now provided at Chatham, that it is limited simply to the Curator of the Museum? The Curator is the officer chiefly employed, but a senior officer is required to be also present at all post-mortem examinations, and operations on the dead body.

109. By senior officer, do you mean a surgeon of a given class?—Yes, a staff surgeon of the first class, or, perhaps, the principal medical officer, who is of a higher grade; when I held the latter position I took pleasure in observing how the young gentlemen generally performed the operations.

110. What extent of practice had the students there? What number of patients are there there ordinarily?—Each had usually from twenty to twenty-five patients; at times more at times rather less.

111. What was the extent of the hospital? what number of patients upon the whole were there?—The number of patients varied, during the summer they amounted sometimes to between four and five hundred, during the winter again they at times did not exceed two hundred and twenty or forty.

112. (*Sir James Clark.*) Is it in your opinion possible to adopt any plan for the purpose of ensuring that medical officers in the army should keep up their knowledge of their profession and the progress of medical science?—I see no plan that could be extensively employed beyond what now exists very generally. At all the principal foreign stations there is a medical library supported by the officers serving in the command, and the contributions to it permit of a considerable number of the best works being purchased as they are published; the books are circulated. A moderate contribution from the public purse would greatly extend the advantages which these institutions now afford, and might also be made available to maintain a small museum in which preparations, especially vascular ones, often necessary for reference, might be at hand when wanted.

113. Might not an officer after serving abroad for some years come home and be a few months at this large hospital?—To a certain extent such is the case now, there is generally one junior officer, sometimes more, required to proceed home yearly from each colony, and the longest in the colony is always selected; he continues to serve at home till he becomes the longest at home, when he again has to go abroad. On his arrival in this country the longest then at home, unless for special reasons, proceeds to replace him.

114. (*Mr. Martin.*) Is that now a matter of order or of accident?—Of order, as will be seen by my last reply; I think it would be a great advantage if officers returning home could have a period of leave allowed to study.

115. They are allowed a certain period of leave for that course of improvement?—They have no period of leave for that.

13 May 1857.

116. (*Mr. Stafford.*) Is there a roster for colonial service?—Yes, for foreign service for staff surgeons and assistant-surgeons.

117. Is that published?—No; no roster is ever published of the men who are liable to go on foreign service.

118. (*Mr. Martin.*) Would it not be desirable that medical officers coming home from any of our foreign possessions, after having served a certain number of years there or coming home on sick leave, should have a period for study allotted to them by roster on arrival in England, the one immediately on his return, and the other on regaining his health?—Yes, for study.

119. Should it not be made a matter of order?—It might be established as a regulation, but it would be necessary in the event of that being done to increase the establishment of medical officers considerably beyond what it is at present.

120. (*President.*) You do not care whether the two Professorships at Dublin and Edinburgh are kept up or not?—I do not, assuming that we shall have a school at Netley Hospital, or wherever the general hospital may be.

121. In point of fact, you think that the course in Dublin or Edinburgh is necessarily very short in military surgery?—It extends only over three months, I believe.

122. The knowledge gained is superficial, is it not, to a certain degree, compared with what you could give in the hospital at Netley?—Yes, limited as compared with what would be given at Netley.

123. You would prefer, if you had your option, that a knowledge of the specialties of military hygiene should be acquired after examination in the large hospital rather than beforehand in Dublin or Edinburgh?—I should prefer their being acquired at the general hospital, and be communicated by officers specially appointed for the purpose.

124. You do not object upon general grounds to the formation of an independent general body of examiners who should institute practical examinations, not only for the army, but if possible for the navy, and possibly for the East India Company?—I do not, still I should desire an examination also by army medical officers.

125. Except that you thought it might convey the appearance of a slur upon the department, you do not see any other objection?—I see only what I have already stated.

126. The slur upon the department after all would not be a real one if the same rule were applied both to the Navy and to the East India Company's service?—Not merited, still it might be regarded one; not so likely, however, if the navy were to be included.

127. On public grounds you see no objection?—None; as what is to be gained by a departmental examination, could still, if thought necessary, be acquired.

128. It would have this advantage, would it not, that it would follow the same rule which is adopted in the civil departments, and which is, generally speaking, a competitive examination, employing foreign examiners rather than their own people?—Yes, and it might if resorted to render unnecessary the competitive examination we now make, and if so, it would not be necessary for me to apply for sanction to employ persons not in my office as examiners.

129. (*Mr. Stafford.*) Do you mean military men or civilians?—Military men.

130. You contemplate, do you not, the removal of the whole establishment at Chatham, the scientific portion of it and the museum, to the new hospital at Netley?—Yes.

131. Netley would completely take the place of Chatham for all the purposes of instruction to probationers?—Yes.

132. Will you have the same advantages there? For instance, shall you be able to have the invalided there?—Yes; that is to say, if invalid barracks be erected.

133. What number of patients is the hospital built to accommodate?—1,200.

134. That is a very much larger number than the hospital holds at Chatham, is it not?—Yes.

135. Do you contemplate strengthening your hospital in the way of patients by having recourse to any other garrisons?—No. I fear sending sick from any considerable distance, as the chance of recovery is lessened, especially in cases of acute disease, by such a proceeding.

136. You would wish to trust entirely to the cases of invalids who were discharged?—I have no objections, but the reverse, to see more there, if others could be removed thither without danger.

137. Then you will lose entirely that number of patients which you have at Chatham, that being a large garrison?—Yes.

138. Then you will have a much smaller field for the exercise of medical skill than you have now at Chatham?—Yes.

139. (*Sir James Clark.*) You alluded just now to acute cases. Are there not many chronic cases which might be sent from the camp to the hospital?—There might be a few, from time to time, but there are not generally in regimental hospitals many chronic cases, as most of this description are, if not likely to recover soon, sent away as invalids at the half-yearly inspections.

140. By an invalid barrack you mean a barrack in which men are to be placed who are brought home for discharge?—Yes, proposed for discharge.

141. From the various colonies?—Yes, and also from stations at home.

142. (*President.*) If the building would contain 1,200 men, and you had only half that number, you would have a barrack close at hand, would you not?—I should be sorry to see any part of the hospital converted into a barrack. The hospital would soon be defaced, and other irregularities would arise, if men not requiring hospital treatment, were to be lodged near to the sick.

143. But the building might be divided into three separate parts, might it not?—It might, but even were that effected, my objections would stand.

144. Have you ever turned over in your mind how you could feed this hospital with patients to enable you to make it a more efficient medical school?—No.

145. Have you ever considered the possibility of admitting civilians to it to be treated?—Never.

146. I understand that in the military hospital at Vienna they not only admit civilians, but they admit women for the purpose of giving practice. Were you consulted as to the site of Netley?—I did not see it before the ground was selected, and I believe purchased.

147. You were not consulted as to the locality?—The ground was selected before I saw it; but I afterwards went there, carefully examined the locality, conversed with the inhabitants for some miles around, and had interviews and correspondence with medical men of Southampton, &c., and I then expressed my approval of the situation.

148. Did you think it was better there than being near a large garrison town?—There are only three large garrison towns near which it could have been, Plymouth, Portsmouth, and Chatham, and to these disadvantages attach.

149. (*President.*) You contemplate making Netley a medical school to a certain degree, and you expect to have forty probationers there?—Forty young medical men, part of them will be commissioned, and part not.

150. Did you have them at Chatham?—Not so many as forty. I contemplate forty in all. The number to be probationers and the numbers to be assistant-surgeons will require to be fixed.

151. You give them their quarters, do you not?—Yes.

152. But they have not quarters at Chatham?—The three senior probationers have.

Dr. A. Smith.

13 May 1857.

153. You give 6s. per day now to the three senior probationers?—Yes.

154. Without quarters?—No, with quarters; and the allowances of an assistant-surgeon, coals and candles.

155. What do the others receive?—Nothing till the three seniors leave.

156. They lodge in the town, I presume?—Yes.

157. At Netley you would give quarters to all?—Yes, and pay.

158. (*Sir Thomas Phillips.*) The same scale of pay?—This has not had my attention.

159. (*President.*) Do you contemplate permanent instructors there, professors who shall be selected for that purpose, not coming by roster, but who would be there permanently to give pathological instruction and clinical instruction, and be curator of the museum, &c.?—Yes; and they should be men with fixed salaries, not looking to advance in the department; as soon as a medical officer gets nearly the top of the officers of his grade, he aspires to promotion.

160. You would give them the charge of the hospital as well as of the instruction?—They might have charges, so far as those might be useful for the purposes for which they were employed.

161. They are not to treat the sick, but simply to treat the students?—They would, I think, be principally required for the instruction of the latter.

162. (*President.*) Can they teach the students without treating the sick?—The students would have the run of the hospital, and the instructors might have a few sick under their charge, to which they could more specially direct the attention of those engaged in study.

163. I presume that no man can give clinical instruction without treating?—No.

164. (*Sir James Clark.*) You mean the professors to the institution?—Yes; the professors should not be liable to be removed to serve on foreign stations.

165. (*President.*) How many should you say?—Two, or perhaps three.

166. (*Sir Thomas Phillips.*) Surely no man could give clinical instruction without treating?—I see no reason why the medical officers who treat the sick should not give clinical lectures.

167. (*President.*) You would have a pathological instructor, who else would you have?—I would have another instructor, at least, to impart to the students all the information which it is desirable medical officers of the army should possess, and which is not communicated fully by the professors in the different medical schools of the kingdom.

168. Have you ever contemplated such a thing as having a certain number of paid fellowships to be awarded by competition like a scholarship at Oxford, to be held by a student for a certain period with an annual payment. Would that in your opinion stimulate the exertions of young men in addition to their pay?—Such would possibly prove useful if we could get the money. If a money reward were to be granted to some who most distinguish themselves, I think it would excite to exertion—say 100*l.* to each for a year or two.

169. You would not want more than 50*l.* a year in addition to the honour and credit?—I dare say such an amount would prove very useful.

170. Do you take any measures to encourage officers abroad, to contribute to the museum by sending home contributions to Chatham?—Yes; but of late it has not been done so much as formerly, because now the wants of the museum are comparatively few. The

collection is so rich that rarely are preparations obtained which differ from those already at Chatham.

171. Were there any preparations of bones and amputated limbs from Scutari?—I am sorry to say not many; they went elsewhere.

172. (*Sir H. Storks.*) To what place did they go?—To different museums in civil life.

173. (*Mr. Stafford.*) You did not get many from the Crimea?—Not very many.

174. (*President.*) You want space, do you not, at Chatham for the museum?—Yes; still we could find room for more than we have.

175. You have things now, have you not, which you cannot place?—Yes; but many of them are duplicate specimens, and therefore not of much value for the museum.

176. Do you think it would be of value, with a view to stimulate industry and love of distinction, if cases were published with descriptions of them where the descriptions were good, and the cases were curious and important, in some medical journal, with the names of the officers who have drawn them up?—An opportunity to do this exists at present, but comparatively few officers take advantage of it; officers are not merely permitted, but they are encouraged to publish.

177. Does not that supply an argument for promoting men who have distinguished themselves by merit?—Yes.

178. (*Sir Thomas Phillips.*) Are you of opinion that there are no means whereby men who have been in the service as assistant-surgeons, should be induced to study before they obtained their next step. Are there no means available for bringing them back, and placing them at Netley?—Yes; they might be brought home and placed at Netley, if the Government would incur all the expenses that would be required, were such a plan observed.

179. If it is a mere question of expense, would not the expense be well employed in accomplishing that end?—I think so.

180. (*President.*) In the same way, I think you hold the opinion that provided it does not interfere with their military duties in hospital, you see no objection to officers upon foreign stations, or I suppose at home, engaging in private practice?—None, on the understanding that it should not interfere with their public duties.

181. Do not you find that it tends to the promotion of their public duties, as practice is a great source of efficiency in a medical man?—It may in that respect prove of advantage.

182. You see no objection to it?—None whatever.

183. (*Sir H. Storks.*) Do not military medical officers engage in a good deal of private practice where they can get it?—Yes; they are allowed to do so.

184. They also gratuitously attend people, do they not?—Yes; probably more in that way than for payment.

185. (*President.*) I suppose as officers never remain for any long time upon any one station, there is no danger of their obtaining, in competition with others, so large a practice as to interfere with the proper discharge of their military duties?—Many officers remain sufficiently long on one station to admit of their acquiring a considerable amount of private practice if they are inclined to undertake it, but care is taken that no one taking private practice shall neglect his public duties for the sake of such practice.

186. (*Mr. Alexander.*) Is there a roster kept now?—Yes.

187. Is that made known publicly to the department?—No.

The witness withdrew.

Sir JOHN LIDDELL, C.B., Director-General of the Medical Department of the Navy, examined.

Sir J. Liddell,
C.B.

13 May 1857.

188. (*Sir James Clark.*) There is an examination of candidates, is there not, before they are admitted into the naval medical service?—Yes.

189. By whom is that examination conducted?—It is conducted by a board of medical officers, or by myself.

190. Are they of your selection?—They are selected by the Admiralty.

191. Of whom do they consist?—They consist of the Inspector of Greenwich hospital, the Inspector attached to Somerset House, and the Deputy-Inspector of Woolwich Hospital.

192. Will you state the course of examination which you pursue with regard to the candidates before you receive them?—Yes. It is very much the same as in the army. It embraces every subject connected with medicine, as will be seen by this paper. (*The same being handed in, vide Appendix No. II.*)

193. Is your examination conducted by means of written papers, or is it a *visd voce* examination?—It is conducted in both ways.

194. You have no practical examination, have you?—No.

195. Would you propose any alteration in your present mode of examination?—No. I think it a very perfect test of the candidates' attainments as it is.

196. Do not you think that a practical examination would be very useful for the purpose of testing the young men on practical anatomy and clinical medicines?—We take certificates of attendance on practical anatomy from established institutions, on the first examination. But at the end of three years we require a certificate of the officers having performed all the operations of surgery.

197. Have you occasion to reject many candidates?—Yes; the rejections are rather numerous.

198. Can you state the proportion?—The last proportion was four out of seven.

199. (*President.*) Do you know what it is in comparison with the army?—No, I do not; but this was unusually large.

200. (*Sir Henry K. Storks.*) What is the average generally?—I should suppose about one-sixth.

201. (*Sir James Clark.*) Do not you think that if you had an opportunity it would be desirable to examine candidates on their practical knowledge in anatomy?—No doubt it would give greater security for their attainments.

202. When a candidate has passed his examination, how do you dispose of him?—We appoint him at once to a ship or to a naval hospital.

203. Is it not advisable always to send them through a naval hospital?—My own opinion is, that it is better to get them on board ship at once, and to let them go to a naval hospital afterwards.

204. Do not you think that an assistant-surgeon could gain a great deal more experience at a naval hospital?—He could only gain the same experience that he had learned in a civil hospital. There is nothing peculiar in the diseases of our naval hospitals, or at all of a special nature.

205. He would get a great deal of practical knowledge there, would he not?—It would be just the same that he had previously had at a civil hospital.

206. If it is thought that he has obtained very little practical knowledge previously, you do not test him?—We test him so far as we can by examination.

207. (*Mr. Martin.*) What are the advantages that young men derive from being on board ship?—They get familiarized with the habits and the disposition of seamen, and the forms and routine of duty on ship board.

208. You bring them back afterwards to the hospital, do you not?—Then they come back very advantageously, and it is a great boon to them to get appointments of that kind.

209. Do they receive any preliminary instruction in naval hygiene?—None.

210. Do not you think that it would be a great advantage to them to receive instruction in sanitary science?—I think that that is the advantage of sending them on board ship at once. They do not fall into the discharge of important duties at once; they are under the control and direction of the surgeon.

211. Is there in the navy any such work as a manual of sanitary science for the instruction of young naval officers?—We have many on naval surgery (but none specially on sanitary science), from Dr. Trotter and Sir Gilbert Blane downwards.

212. Would it not be an advantage to have a manual or a code of sanitary science for the benefit of young naval officers?—No doubt it would.

213. Comprising all the knowledge now accumulated?—Yes, it would be important; part of this, however, is now given by the statistical reports of the navy, which are regularly published.

214. (*Mr. Alexander.*) Do you find that a sufficient number of candidates come forward for competition?—Yes; they are now sufficient for our wants.

215. How many in the course of a year do you generally have?—It would be difficult to say. This last year we have admitted sixty-five.

216. (*Mr. Stafford.*) The pay has been increased, has it not?—Yes.

217. (*Mr. Alexander.*) How often have you competitive examinations?—None, not in the usual acceptation of the word; it is so far competitive that we have a standard of qualification, and if candidates do not come up to that standard they are rejected.

218. (*Sir James Clark.*) Are the naval hospitals supplied with libraries and museums?—Yes, two of them; the two large ones of Plymouth and Portsmouth.

219. (*Mr. Martin.*) Is that the case in any of the hospitals in our great foreign possessions?—No.

220. (*Sir James Clark.*) You have a second examination, have you not, before you promote?—Yes.

221. When does that take place?—At the end of three years' service.

222. It may take place then, but not necessarily so?—It cannot, by the navy regulations, take place before. He is not admitted to promotion till after three years' service.

223. Does the second examination differ from the first?—It is more practical.

224. (*President.*) And more special, is it not?—It chiefly embraces the same subjects as the first. We endeavour to get as much knowledge of the capacity of the individual as we can.

225. Is the examination conducted by the same board?—No; it is either by myself or the medical inspector attached to Somerset House.

226. Do not you require them before passing the second examination to spend some time at a medical school to practise dissecting?—Yes, they must attend a dissecting school for some time, not only to improve their knowledge of anatomy, but to perform the different surgical operations. They cannot be admitted to the examination until they produce a certificate from a professor, that they have performed all the operations in surgery with the requisite skill. (*Vide Appendix No. IV.*)

227. (*Sir Henry K. Storks.*) Are naval surgeons required by regulation to make post-mortem examinations?—They are not enjoined to do so, but they generally go through the same forms as one would with one's relations on shore.

228. But they are not enjoined to do it?—No; it would in many cases be attended with very great inconvenience on board ship, on account of the prejudices of seamen during prevailing diseases; however it is generally done; but this precaution is taken that the messmates are asked whether they have any objections, and if not it is done.

229. (*Mr. Stafford.*) Is that course pursued in every case?—In every case the death is reported to me,

Sir J. Liddell, C.B., and a reason is assigned for a post-mortem examination not having taken place.

13 May 1857. 230. (*President.*) You stated that it was an advantage to an assistant-surgeon to go at once to a ship rather than into a hospital?—I think so.

231. But an assistant-surgeon does not stand in the same position in the naval service as in the army, he does not treat nor operate, does he?—No; he merely assists the surgeon.

232. He only watches?—He assists the surgeon in all his duties.

233. In a ship he operates under the veto of his superior officer?—He does not operate at all unless in medical charge.

234. In point of fact he is a student more than anything else with you?—He acts with the surgeon.

235. (*Mr. Stafford.*) He gets accustomed to the sea, does he not?—Yes.

236. And that is the great reason, is it not, why he is sent on board ship at first?—Yes.

237. (*Sir James Clark.*) When you require a certificate that he has attended a dissecting school, do not you also require him to have a certificate that he has attended clinical lectures, and studied medicine and surgery?—We require all that at the first examination.

238. Is he kept on full pay when he is on shore?—No.

239. Is not that a great hardship?—Yes.

240. He is acquiring knowledge, is he not, for the good of the service?—Yes; it would be very important to the service if a surgeon could be kept on the ship's books for a month or two after he comes on half-pay, to renew his studies at one of the schools of medicine.

241. (*Sir Thomas Phillips.*) Is there any period during which you require them to study afterwards?—No; they require to bestow a certain amount of attention to get through the examination.

242. What time do they require?—A fortnight or three weeks. It is merely practical anatomy and the operations.

243. Merely to attend the demonstrations?—No, to perform the operations in person.

244. In practical anatomy and in surgery?—Yes.

245. These are the two subjects that they are required to devote themselves to after they have been on ship board?—Yes, after they have served three years.

246. And that you say need not occupy them above a fortnight?—A fortnight or three weeks.

247. The rule is imperative, is it not, that they should devote a fortnight or three weeks to operations?—They must devote a sufficient time, and then their general attainments are tested, and if they fail they have to renew the examination at some other period.

248. Is that time adequate?—Yes, with the knowledge that they have previously acquired.

249. Should it be extended, do you think?—It might be with advantage.

250. (*Sir James Clark.*) If it were extended to six months on full pay, you would require attendance on clinical lectures?—Yes; that would be a great benefit.

251. (*President.*) In the case of a young assistant-surgeon, who, say two years and six months after he has entered the service, goes out to a four years station in the Pacific, how do you examine him?—There is a local examination, if necessary, in order to give him the position of an acting surgeon, but still he must pass a second examination when he returns home, before his promotion is confirmed and dated back.

252. He is promoted, is he not, subject to passing his examination on coming home?—Yes; it is required that the examination abroad should be by three naval surgeons to see that he is qualified.

253. (*Mr. Stafford.*) Does it often happen that a man who has passed a local examination fails when he comes home?—I do not recollect an instance; it is quite possible; he is not let off a bit easier.

254. (*Sir Thomas Phillips.*) Have you ever known an assistant-surgeon fail to pass an examination at

the end of three years?—Occasionally; and he is remanded for further instruction.

255. (*Sir Henry K. Storks.*) Then he gets another chance of examination?—Yes.

256. You do not strike him off the list?—No.

257. (*Sir James Clark.*) You have four ranks of medical officers in the navy, have you not?—Yes.

258. (*Sir Thomas Phillips.*) What are they?—An inspector, a deputy-inspector, a surgeon, and an assistant-surgeon.

259. (*Sir James Clark.*) Could you state the number of each in the navy?—There are five inspectors employed and one unemployed; ten deputy-inspectors employed and five on half-pay; there are about 186 surgeons employed and about 142 unemployed, many of whom could not serve if called upon.

260. (*Sir Henry K. Storks.*) They are on half-pay, are they not?—Yes.

261. (*Sir James Clark.*) Have the medical officers their fair share of promotion as compared with other officers in the service?—Yes, I think so, in the case of assistant-surgeons, but certainly not in the higher grades. There are 262 assistant-surgeons employed and three on half-pay. Those are only on half-pay because they are not in a very fit condition to serve.

262. (*Mr. Alexander.*) How does promotion take place? is it by selection or seniority?—Partly both. If merit is equal it is always by seniority.

263. (*Sir James Clark.*) Do you see any objection to a board being established to examine candidates on entrance into the navy and army?—No; but I think it would be very desirable that the head of the medical department should be one of the examiners. It is a very important element in acquiring a knowledge of their attainments. I do not know any special objection that could be made to it.

264. (*Mr. Martin.*) On professional grounds?—No.

265. (*President.*) You are aware, are you not, that the East India Company's examinations are so conducted?—Yes.

266. Do you know anything of the success of their plan?—I am told that it is very successful; but it is a very favourite service.

267. (*Sir Thomas Phillips.*) Might not the heads of departments preside at the examination?—Yes.

268. (*President.*) Do you give any lectures at Haslar?—Yes; there are three months in the year in which clinical lectures are enjoined, but they have not been very successful. You cannot get persons to attend, there are so few assistants in the hospital.

269. Who are the lecturers?—The inspector and the deputy-inspector.

270. Whoever they may be at the time, without reference to their qualifications?—Yes.

271. The lectures are not invariably very attractive, are they?—No; but if we had a Guthrie it would not be possible to ensure an audience. It is inconvenient getting to Haslar from a ship at Spithead.

272. (*Mr. Martin.*) Should not such instruction be matter of order and imperative upon officers coming home?—Yes.

273. For officers coming home sick?—Yes; if capable of study.

274. (*President.*) Practically you think that the real cause of difficulty has been that the assistant-surgeons are in ships at Spithead two or three miles off, and that there is great difficulty in their getting ashore?—Yes, and the expense too. If you made it compulsory no doubt it would be beneficial. I do not know that it would be beneficial if you selected officers from the institution itself; but if you had a special professor it might do better; it would very often happen that they would be lecturing to bare walls. At this time there is not a ship at Spithead, and it is now the period for lectures.

275. The number of assistant-surgeons in the hospital itself is very small, is it not?—Yes.

276. That is a peculiarity of the naval service?—Yes.

277. (*Sir James Clark.*) If all the assistant surgeons were to pass a certain time at a naval hospital, you would then generally have a considerable number there if you kept them a year?—Not unless you increased the number far beyond our wants.

278. On the average, how many assistant surgeons are taken into the navy annually?—Last year there were sixty-five; the number varies very much.

279. (*President.*) You mean after the conclusion of the war?—Yes.

280. Would that be the annual admission in peace?—I should think it would be less than that.

281. (*Sir Henry K. Storks.*) Are there a great many who leave the navy after having remained in it some time?—Yes, a great many.

282. Do you happen to know the proportion?—I cannot tell exactly.

283. (*President.*) Which go the first?—It is always the best that resign the service.

284. (*Sir Henry K. Storks.*) What is the pay of an assistant surgeon?—When he first enters it is 8s. 1d., and it goes on increasing to 10s. 1d. a day.

285. After how many years' service?—After ten years' service it is 10s. 1d. when in charge.

286. That is the highest, is it not?—Yes, that is the maximum of an assistant surgeon's pay.

287. (*Sir James Clark.*) When he comes to be a surgeon what is his pay?—His first pay is 11s.; then it goes on to 12s. and 14s.; and then there is a long stop. He has to serve ten years without any increase.

288. (*Mr. Stafford.*) Have they any other allowances?—None.

289. (*Sir Thomas Phillips.*) Is Haslar Hospital occupied as a place of instruction for the navy?—Not at all: only for the care and cure of the sick.

290. Have you any hospital at all where naval students are instructed?—None; that is the largest and best, and best calculated for a school of that kind.

291. And the most convenient?—Yes. It is a little inaccessible.

292. Is the number of patients large at Haslar?—Yes; at present there are about 500.

293. Does it ordinarily supply that amount of instruction to young men?—That is the average number of sick.

294. (*Mr. Stafford.*) Are there 500 patients exclusive of the lunatics?—No, it is inclusive.

295. How many lunatics are there?—One hundred and twenty.

296. (*Sir Thomas Phillips.*) None but men are admitted?—None but men.

297. (*President.*) Do you exact the courses in Dublin and Edinburgh, or do you prefer young men who have gone through military and naval hygiene?—No; I think we get them just as well from the London hospitals.

298. You do not prefer their having been through that course which is special?—No.

299. (*Sir James Clark.*) You would rather have a sound course of common surgery?—Yes; common surgery is military surgery, I think.

300. (*President.*) There is a good deal of work on shore with the marines, is there not?—Yes.

301. There are diseases peculiar to seamen, are there not?—I am not aware that there are any diseases peculiar to seamen.

302. Is not their mode of life and provisioning one which produces peculiar diseases; formerly there was more scurvy?—Yes; but I have seen more scurvy in the Paris hospitals than I have seen at sea. There was a great deal in the Black Sea from defective or innutritious food, but with their ample general diet this disease is most unusual.

303. (*Sir Thomas Phillips.*) The diet is the subject of hygiene with you, is it not?—Yes.

304. (*President.*) Do you encourage your officers to send you home scientific reports?—Yes; I have periodical medical reports from them every quarter, statistical and descriptive of the country where they happen to be, and the diseases.

305. What do you do with them?—I read them, and they are kept for future reference. *Sir J. Liddell, C.B.*

306. You never attempt to select them and publish them?—Never publish them, but the best journals are selected for a prize established by Sir Gilbert Blane.

13 May 1857.

307. Have you ever contemplated that?—Yes; I have tried to find some means of doing it, but I should say that we have our statistics published periodically in a blue book which embraces the greater part.

308. You do not send contributions to medical science from the results of the experience of your medical officers?—No. If the officers wish anything to be published they ask my permission, which is never refused.

309. Do they practically do so?—Yes.

310. With a view to obtain reputation?—Yes.

311. Does that influence their subsequent advancement?—Yes, it always tells in their favour.

312. Do you promote them by selection?—Yes, and seniority.

313. Seniority is the great element?—Yes.

314. Do you find that many complaints are made of the selections?—I dare say there are, but they never reach me.

315. (*Sir Thomas Phillips.*) Are the Commissioners to understand that you regard this as the best mode of improving the knowledge of a young man, namely, that he should first go to sea after you have admitted him, and that after having been at sea a given time he should then pass a longer period than is the case at present in increasing his knowledge of his profession?—Yes, decidedly; and that course we pursue. When we get an assistant-surgeon of sufficient standing we appoint him, if possible, to a hospital for twelve months or more.

316. (*Sir Henry K. Storks.*) It would be necessary, would it not, to give them full pay after the ship has been paid off?—That is very desirable. The great objection to our service is that when surgeons are paid off they remain a long time on shore, and during that period their time is forfeited.

317. (*Mr. Martin.*) So that all that time is practically lost for improvement?—Yes, unless they study at their own expense.

318. (*Sir James Clark.*) What leave do you give them?—There is no specific leave. Unfortunately, we give surgeons longer than they want. We have about 140 now unemployed.

319. You do not give them full pay, even for a few weeks' leave?—If it is a few weeks from a hospital or a ship, then their pay goes on; but if they are discharged from the ship and go on half-pay, there is no further allowance made.

320. (*Mr. Stafford.*) Do they contribute many specimens to the museum at Haslar?—Yes. It is a very valuable museum. It is, I fancy, the most valuable museum in England for dried specimens, which were chiefly prepared under Sir John Richardson's directions.

321. You have a good pathological museum, have you not?—Yes.

322. (*Sir James Clark.*) You think that it would be of great importance that a naval surgeon on half-pay should be kept on full pay?—It is very desirable that it should be so for a certain period, for the purpose of instruction; both the individual and the service would gain.

323. (*Mr. Alexander.*) How many of the four ranks you have mentioned are executive?—They are all professionally executive. The higher they rise in the service the more laborious is their professional duty.

324. (*President.*) You place the greater responsibility of the medical treatment on the higher officers?—Yes.

325. How do you manage with the administration of the hospitals, which in the army forms one of the higher branches of the medical profession?—There is an agent or steward to all our naval hospitals, who demands all the stores that the hospital requires, and keeps them up. In fitting up the Belleisle hospital ship for China it was done in a few days. We know

Sir J. Liddell, that if certain stores are sent the hospital will be complete.
C.B.

13 May 1857. 326. Have you everything laid down for every patient?—Yes.

327. You tell the agent the number of patients that he is to prepare for?—Yes.

328. (*Mr. Alexander.*) Your hospitals are complete, are they not, in everything in that respect?—Yes.

329. You supply all your patients with spoons, knives and forks, and shirts from those stores?—Yes, everything; including their clothing.

330. (*President.*) Your ration includes a good many things, does it not, which are extras in the army hospitals?—I am not quite sure what the army extras are. We have none in our diet. Our diet embraces everything that is requisite for the sick.

331. (*Mr. Alexander.*) Have you extras, such as wine and porter, and such things?—In the diet there is a certain portion of wine or beer allowed for the diet, but it may be lessened or increased as the case may be.

332. (*President.*) Are sugar and arrowroot included in the diet?—No; those are called medical comforts, and are prescribed by the medical officer in the prescription book in the same way as wine and porter, and are supplied by the medical storekeeper.

333. (*Mr. Alexander.*) Do you enter every case in your register?—Yes, every case.

334. (*Sir Henry K. Storks.*) Who enters it?—The surgeon. When a patient is received from a ship into hospital, which is the usual source of our patients, the case is sent by the surgeon of the ship, descriptive of what took place previously to his admission, and a medical officer of the hospital makes a record of his state, and keeps up that to the close.

335. What is the register a shipboard?—That consists of a sick list, which contains the man's name in writing, the day that he was put on the sick list, his disease, and when he was discharged. If the complaint is of importance there is a regular detailed record kept by the surgeon in the journal which is sent to my office every year.

336. (*Mr. Martin.*) A regular case book?—Yes.

337. (*Mr. Alexander.*) A trivial case is entered, is it not, in a sort of admission and discharge book?—Yes; the daily sick book, we call it.

338. They do not report every day upon those cases?—No; the surgeon transmits it with his annual account, so that every case which occurs is reported.

339. (*President.*) He only gives the details of the case and the treatment if it is a very peculiar and important one?—Yes; the great mass of cases treated by the surgeons consist of bruises, ulcers, and boils, or anything that disqualifies a man from using his hands or legs.

340. (*Mr. Alexander.*) Are those cases entered?—Yes. Every man who is unable to do his duty can only be exempted by being put on the sick list, and that appears at the end of the year, however trifling. If he has a headache for a night, he goes on the sick list.

341. (*Sir James Clark.*) They only record cases of importance?—In the journals; but they record every case in the sick list.

342. (*Mr. Alexander.*) With regard to the registry of every case, if a man has a black eye, do you say that he has a bad eye, and so on?—Yes; that would come under the head of contused eye; every case that the surgeon has under his care is reported.

343. Could you furnish the Commissioners with a copy of the registers or journals?—Yes; the sick list, the journal, and the nosological return.

344. Would you also furnish them with the instructions to the agent, showing what things he has to provide, and the diets?—Yes; I will hand in this book (*the same was delivered in*).

345. (*Sir Thomas Phillips.*) By whom are the medicines prepared on shipboard?—By the assistant-surgeon.

346. He makes up the preparations?—He compounds the prescriptions.

347. He is the dispenser of the ship?—Yes.

348. (*Mr. Alexander.*) On shore you have a dispenser, have you not?—Yes, at the naval hospitals.

349. Have you a purveyor, who supplies all the diet?—Yes; the agent issues all articles of diet.

350. Does he make the contracts?—No; contracts not made in London are submitted to the Admiralty for approval.

351. Who makes the contract?—The Admiralty generally, excepting abroad.

352. (*President.*) Is the agent the same person as the steward?—Yes.

353. (*Sir Henry K. Storks.*) Does he make up the diet-rolls?—There is a diet-table kept by the medical officer, which he makes up every morning in his round of the wards, and that is sent to the agent, to procure the materials. The food is entirely in the hands of the steward; but for clearness the scale of diet is written on this paper (*producing a printed form*) in order that the medical officer may see on what diet a man is.

354. (*President.*) Will you read the articles of the diet?—It is a scheme for full diet for the patients of the Royal Hospital:—A pound of bread, a pound of mutton or beef, a pound of potatoes or greens, 25 drams of herbs for broth; barley, 14 drams; salt, 8 drams; vinegar, 16 drams; tea, 4 drams; sugar, 16 drams; milk, $\frac{2}{3}$ ths of a pint; broth, one pint; small beer, 2 pints, or strong beer, $1\frac{1}{2}$ pint. Veal, fowls, fish, in such quantities, in lieu of beef or mutton, as the medical officer may prescribe. There are four different descriptions of puddings for low diet.

355. (*Mr. Alexander.*) Then the steward and agent provides everything for the hospitals ashore?—Yes.

356. (*Sir Henry K. Storks.*) What does a seaman pay in the hospital?—Nothing.

357. (*President.*) Is this the whole code for your medical departments?—For the hospitals. There are additional instructions for the service afloat, and foreign hospitals, which I will send the Commissioners.

358. Do those embrace the whole?—Yes, they embrace the whole.

359. You have no unwritten law?—No; the head of the establishment would use his discretion in matters not specially provided for in these instructions.

360. So that every man can find in these two books everything that is wanted?—Sufficient to guide him in his general duties.

361. (*Sir James Clark.*) In twenty-four hours you can supply everything that is necessary?—Yes; we can do it in a day. We have a store at Deptford and at Haslar.

362. (*Mr. Alexander.*) How are the repairs in the hospital performed?—We send in, in November, so as to be in time for the navy estimates, an estimate of what we require during the year—whitewashing, repairs of building, &c.—and these are done in the course of the year, as suits the convenience of the hospital.

363. Who carries this out?—It is either done by contract or by employing people to do it, under the directors of works.

364. Has the medical officer the power to do that?—No; he has the power to request it to be done.

365. The purveyor has the sole charge of everything in the hospital, has he not?—Yes, of all stores.

366. Is he under the senior officer of the hospital?—There is the superintendent, who has authority over him as he has over the whole of the officers.

367. The superintendent is under the principal medical officer, is he not?—No.

368. I mean that the steward who issues the diet is under the charge of the principal medical officer?—No.

369. (*President.*) Suppose that the agent did not provide the hospital properly, what would be done?—Then he would be complained of.

370. By whom; by the principal medical officer?—He might be; or by the superintendent.

371. To whom?—To the Admiralty.

372. (*Mr. Stafford.*) He would complain to the Superintendent of Haslar Hospital, who would report him to the Admiralty?—Yes.

373. (*President.*) Could he dismiss him?—No; that would be a very serious question.

374. Could he try him?—He could suspend him from duty and report him to the Admiralty.

375. You have hospitals abroad?—Yes.

376. There, when you cannot wait, how is it?—There the deputy inspector is also the agent and steward. He has a clerk to keep his accounts, but he takes the place of the steward of our home hospitals.

377. Does he buy, and make contracts for the hospital?—Yes.

378. He is the commissariat officer for the hospital, is he not?—Yes.

379. (*Sir Henry K. Storks.*) He orders what is required?—Yes, everything; and he gives security as a cash officer.

380. Does every deputy inspector do that when he goes abroad?—Yes; when he goes to a hospital.

381. Does this system work well?—Admirably.

382. (*Sir Thomas Phillips.*) What class of officer is the superintendent of a hospital?—A captain in the navy.

383. He is the executive head?—Yes.

384. Everything is done on his responsibility?—Yes; except the medical duties.

385. (*Mr. Alexander.*) At each naval hospital is there one of those superintendents?—Yes, at home; that is in the two hospitals at Plymouth and Haslar.

386. (*Sir Thomas Phillips.*) The inspector has a large practice, has he not?—Yes; the higher they rise the more professional labour they have.

387. (*Mr. Alexander.*) Have you a long room in which the washing is performed, which is done by women?—We have a regular washing house.

388. Have you cooks set apart for the purpose of cooking for the hospital?—Yes, specially set apart.

389. (*Sir James Clark.*) Have you female nurses?—Yes, for the medical wards, and men for the others.

390. (*Mr. Alexander.*) Do the women answer well?—Yes.

391. In what proportion are they?—One for every seven patients.

392. And for the men, is the proportion the same?—Yes. We give the preference to seamen's wives or widows.

393. (*President.*) Do you get any nurses from the London hospitals?—No.

394. At what rate do you pay them?—The female nurses have 20*l.* a year, and their provisions and clothing. The men have 1*s.* 6*d.* a day, and their provisions and clothing.

395. (*Sir James Clark.*) When you have done with the nurses, what do you do with them, do you discharge them?—Yes; I am sorry to say we do.

396. (*President.*) Do you discharge them when they become unfit from age?—Yes.

397. You cannot take them in young, can you?—Yes.

398. Do the young ones ever give you any trouble?—Occasionally; but less than the old.

399. (*Mr. Alexander.*) Have you hospital accommodation for sick officers?—Yes.

400. In all your general hospitals?—Yes.

401. (*Sir Henry K. Storks.*) They are treated as the seamen are, are they not?—Yes; they have cabins according to their rank in the navy, one or two. They have the same accommodation as on board ship.

402. (*Sir James Clark.*) Could the establishment of nurses be greatly improved?—Not now. Since the pay has been increased we get a very respectable class.

403. When you do not want their services, what do you do with them?—They are discharged on reduction; we always keep up a certain number, but if the number of patients is very much reduced then they are discharged.

404. (*Sir Thomas Phillips.*) Would no length of service give a right to a pension?—No; unless at

Greenwich hospital, where they do receive pensions. *Sir J. Liddell, C.B.*

405. (*Sir Henry K. Storks.*) Do the officers pay any stoppages while in the hospital?—Officers from ships on full pay are charged nothing for their subsistence in naval hospitals; but a limited number are admitted from half-pay, whose cases are likely to be benefitted by hospital treatment, and pay at the rates set forth in the following scale:—

CAPTAINS.		s. d.
For the First Month, at the rate of -	0 10	per diem.
For the Second Month, at the rate of	2 6	"
For the Third Month, and beyond } that period, at the rate of - - }	3 0	"

COMMANDERS.		s. d.
For the First Month, at the rate of	0 10	per diem.
For the Second Month, do.	2 0	"
For the Third Month, and beyond } that period, at the rate of - - }	2 6	"

LIEUTENANT AND WARD ROOM OFFICERS.		s. d.
For the First Month, at the rate of	0 10	per diem.
For the Second Month, do.	1 3	"
For the Third Month, and beyond } that period, at the rate of - - }	2 0	"

Half-pay officers admitted into the lunatic asylum at Haslar are charged 1*s.* 6*d.* a day during the whole period they remain there, and 1*s.* 6*d.* a day is also charged to officers from full pay, after they have been a year in the asylum. The above deductions include all charges, and are for subsistence only.

406. And the officers who are borne on the ships' books pay nothing?—Nothing.

407. (*Mr. Alexander.*) Do you receive private and confidential reports as to how the officers conduct themselves?—None.

408. (*President.*) How do you judge of the merits of officers for promotion?—Principally from personal knowledge of them, and also from their medical returns.

409. (*Sir Thomas Phillips.*) When a ship is paid off, are reports made of the conduct of the medical officers?—Yes; every officer is obliged to produce certificates of his conduct.

410. (*President.*) By whom is the certificate signed?—The certificate of the surgeon is signed by the captain, and the assistant surgeon's by the surgeon and captain.

411. (*Sir Thomas Phillips.*) Are those certificates preserved?—Yes.

412. (*President.*) You judge of their merits likewise by their medical reports, do you not?—Yes; I peruse the journals, which is the best of all tests.

413. (*Sir Thomas Phillips.*) Do the statistics of disease on board ship afford you an opportunity of testing the merits of the treatment?—It helps us a little.

414. (*President.*) What should you say was the proportion of cases in which promotion goes by selection, as compared with seniority?—I think that there may be one-sixth by selection.

415. Is it as little as that?—Yes, I think so.

416. (*Mr. Alexander.*) An assistant surgeon must have served three years before he obtains promotion, must he not?—Yes.

417. He can be a deputy-inspector after four years' service?—Yes, after being four years surgeon.

418. So that in seven years he may be a deputy-inspector?—Yes, he may be; but that has never occurred.

419. Have you compulsory retirement after a certain age?—Yes.

420. At what period, in the case of a surgeon, must he retire from the service?—A surgeon afloat must retire at sixty, a surgeon on shore at sixty-five, a deputy-inspector at sixty-five, and an inspector at seventy.

421. (*Sir James Clark.*) For what time are your officers at the hospitals appointed, is it for a limited

Sir J. Liddell,
C.B.

13 May 1857.

time?—No; permanently, up to a certain age, except the assistant-surgeons.

422. Would it be advantageous to have a certain term fixed, say of five years?—No; I do not think so.

423. (*Mr. Stafford.*) For what reason?—Because I think you would lose the benefit of all their experience in the hospital, and you would appoint a young man who had not had an opportunity of acquiring that experience. I think that the public service would lose by that arrangement; and if you take him by seniority it does not follow that he has had much personal experience.

424. (*Mr. Martin.*) Seniority would appear to be almost the absolute rule for promotion?—Not for the higher grades. Seniority with merit, all things being equal.

425. (*Sir James Clark.*) Would it not be a great boon to an officer to have the chance of getting such an appointment?—Yes, no doubt it would, but I think it would be a great loss to the service.

426. Suppose you had an unfit man, what would you do?—Then you would supersede him.

427. Is your recommendation always asked before a man is appointed?—I think so always.

428. Is it always taken?—It is not always taken, but I do not think that any man is appointed without my concurrence.

429. But some that you propose to appoint are rejected, are they not?—That, I must say, happens very seldom.

430. Do you think that it would be advisable to extend the term of their appointment to the naval hospitals to ten years?—I do not think that the great body of them hold those appointments above ten years. They are very seldom appointed to a naval hospital under fifty.

431. At what age must they retire?—A deputy-inspector must retire at sixty-five, and an inspector at seventy.

432. (*Sir Thomas Phillips.*) What is the superannuated pay of officers who retire at those ages?—It depends entirely upon the length of service. (*See Appendix No. VI.*)

433. (*Mr. Alexander.*) You have a lunatic asylum, have you not, for sailors?—Yes, and marines.

434. Does a patient remain there until he recovers or dies?—Yes, unless removed by his friends.

435. Are the recoveries great in proportion to the cases?—Not very.

436. Are they equal to those treated in civil establishments?—Yes, quite. The proportion will be less now, as they have recently received pensioners from Greenwich Hospital, who being old men never recover.

437. (*Mr. Stafford.*) How long has that been the case?—I think for ten years.

438. (*President.*) The officer at the head of that establishment is a permanent officer, is he not?—Yes.

439. You do not allow them to come in rotation?—No.

440. When an officer is appointed, what means do you take to ascertain that he is acquainted with the special treatment of lunatics?—At first they were taken from the list of deputy inspectors.

441. That was a very bad arrangement, was it not?—Yes. Dr. Anderson was then appointed from a lunatic asylum, and he brought ours into its present high condition.

442. He had conducted an asylum under Dr. Conolly had he not?—He was connected with him; he had the charge of a civil asylum at Denham Park. The present superintendent was his assistant, so that he was thoroughly well instructed in his duties.

443. You are satisfied, are you not, that you can treat the lunatics better there than if you sent them to a private asylum?—We have the most perfect security. It is worth anybody's while to see the asylum at Haslar.

444. (*Mr. Stafford.*) Do you think that naval discipline is of use to the patients?—Yes. They are taken care of, and carefully watched, and exercised in the country, and in boating, fishing, &c.

445. Do you think that the habit of discipline kept up in a naval asylum is any assistance to these men?—It is possible that the regularity of their habits may conduce very much to their restoration.

446. (*Sir Thomas Phillips.*) That would be the case at any properly conducted asylum, would it not?—Yes; you have every variety of character, and there is a good deal of intellect left in most of the insane.

447. (*Sir Henry K. Storks.*) Have you many lunatics in the asylum?—There are 120 just now.

448. (*Sir James Clark.*) When they recover, what do you do with them?—We discharge them.

449. Do you ever take them back?—Occasionally they come back. If they are discharged from the service previously, they are not taken back into the service; but in the cases of delirium tremens, they recover and go back again to their ships.

450. They are sometimes taken away by their friends, are they not?—Very seldom.

451. You have sometimes officers who are lunatics, have you not?—Yes, officers of all grades.

452. (*Sir Thomas Phillips.*) Are all those persons who became lunatics sent to Haslar?—Yes; we have no other establishment. I am just sending an attendant for one now from Haulbowline. We call them attendants, not keepers.

453. (*Sir James Clark.*) The chief medical officer at Haslar has the complete command over the interior of the hospital, has he not?—Yes; over his own wards.

454. Can he direct everything as to the patients in cleaning the wards and so forth?—Yes.

455. (*Mr. Martin.*) Has he the entire sanitary as well as medical and surgical control of the hospital?—Yes; within the wards.

456. (*Mr. Stafford.*) Can he order any repairs?—No; he submits what he wants to the superintendent, who transmits it to the Admiralty, and then if it is approved, it is put into operation.

457. Is that the course pursued if a stove is wanted?—No; I referred to the repairs of the building.

458. He cannot undertake them on his own responsibility?—No; anything that is immediately wanted he must refer to the superintendent.

459. (*President.*) Cases of urgency do not often occur at home, do they?—No.

460. But abroad, supposing a case of urgency arose?—He can purchase abroad anything that may be wanted.

461. With regard to an alteration in a building, how would that be done?—He would send home an estimate in the same way.

462. Suppose the case of very offensive drainage, or leakage, what is the course pursued?—That is corrected immediately. The admiral of the station would authorize that.

463. (*Mr. Stafford.*) Would it be done in that way, say, at Malta?—Yes; if it was a thing of such urgency that it could not wait for the Admiralty authority he would do it.

464. (*Sir James Clark.*) Supposing that you wanted a stove, all that you would have to do would be to send down to the steward for one?—Yes.

465. (*Mr. Alexander.*) If he had not it, could he purchase it?—Yes; or he would apply to me if at a hospital at home. He cannot purchase any stores without sending to me a list of the things and the prices; and if I can procure them better and cheaper I supply them from London.

466. (*President.*) In a hospital abroad, you have one superior medical officer, who is the administrative officer?—He is also professional.

467. Does he treat patients?—Yes.

468. Would he operate and prescribe?—Yes.

469. All the officers of all ranks are concerned in the immediate and direct treatment of the sick, but one officer of the highest rank is administrative likewise in a foreign hospital?—Yes; in addition to his medical duties.

470. At home there is none?—None.

471. Are you satisfied that that is the best plan?—Yes; I think so.

472. Do you think that they give more attention to the medical duties from being relieved of the drudgery of the administration of the hospital at home?—The administration with a regular system is easy enough, and could be well performed by a medical officer, having the clerical work done by a clerk.

473. (*Sir Thomas Phillips.*) What number of medical officers have you usually attached to your hospitals abroad?—There is a deputy-inspector, a staff surgeon, and medical storekeeper, several assistants, and a clerk, being all under the directions of the deputy-inspector, who is responsible for the whole duties of the hospital.

474. (*Sir James Clark.*) What number of patients does the Malta hospital contain?—About 300.

475. (*Sir Thomas Phillips.*) There you have a deputy inspector with a certain staff of surgeons, have you not?—Yes.

476. And a storekeeper?—The deputy inspector is also agent in charge of stores, and there is a clerk to keep the accounts.

477. (*Mr. Alexander.*) Have you a dispenser there?—An assistant dispenser.

478. (*Sir James Clark.*) That is your largest foreign hospital, is it not?—Yes; I think that the hospital at Jamaica would contain 150, and Bermuda about 100.

479. (*Mr. Alexander.*) Have you tables placed between each patient, and everything in your wards which they require?—Yes.

480. Does the agent provide those?—Yes.

481. (*President.*) Are those in the list which the agent has?—Yes.

482. Is there a shelf over the patient's head?—We have done away with that, as it harbours the dirt, and we have given them a table instead.

483. Where does the patient keep his effects?—Patients' effects are kept in a store-room, and given up to them on their discharge.

484. (*Sir Henry K. Storks.*) Has each man a bed-ticket attached to his bed?—No; the prescription ticket lies upon his bed (*the form being handed in*).

485. By his prescription ticket you can see every day what treatment he has received, and the progress of his ailment?—Yes.

486. This is always attached to his bed, is it?—Yes.

487. (*Sir James Clark.*) You consider the sanitary condition of all your naval hospitals to be good?—Yes; I have seen nothing like them anywhere, and they have always been so.

488. (*Mr. Alexander.*) You have not much writing?—Not much on board ship, but a great deal in the hospitals.

489. (*Sir Thomas Phillips.*) Would this paper be the paper placed upon the bed of the patient?—Yes, at the bottom of his bed. When the medical officer goes his round he takes it up and marks it, and then the tickets are collected by the nurse and taken to the dispensary for the medicines.

490. (*Mr. Martin.*) Have you convalescent wards?—No; unless for infectious complaints. When the disease ceases we remove the patients into another ward; not along with others, but separately. We do not keep convalescent wards.

491. Not as a standard rule?—No; we find it answer much better to have a certain number of healthy men with the diseased ones.

492. (*Sir James Clark.*) Have you not fever wards?—Yes; in infectious cases. We separate such cases as exsypelas. They are always in separate wards.

493. You put them into one ward, do you not?—No, in separate wards; measles in one, small pox in another, and scarlet fever in another.

494. (*Mr. Alexander.*) You use crockery and tin, I believe?—We have some tin, but very little, we prefer crockery.

495. Have you water-closets, with abundance of water?—Yes.

496. When a ship surgeon sends in a requisition for medicines to the storekeeper, do you require a certificate?—Yes; the regular scale of medicines is supplied to all the ships every year or oftener. If a surgeon wants any partial supply, he sends a requisition to the medical storekeeper of the hospital, who supplies him.

497. He gets it without any approving signature?—Yes.

498. (*Sir Henry K. Storks.*) The male and female nurses have rooms to themselves, have they not?—Yes.

499. They never sleep in the wards?—No; we have a cabin or screened berth attached to each ward.

500. (*Mr. Alexander.*) How many cubic feet do you allow to each patient?—About 1400 feet. We always keep four feet between each bed.

501. (*President.*) From edge to edge of the bed—that is, about six feet from head to head of the patients?—Yes.

502. What is the width of the bed?—About three feet.

503. (*Sir Thomas Phillips.*) Then it is about six feet, or six feet six inches?—Yes.

504. (*President.*) Have you wards in which there are beds on both sides?—Yes.

505. What distance is there between the beds in those wards?—Our beds are about six feet two inches long, and the wards are twenty-four feet broad.

506. (*Mr. Stafford.*) What height are they?—They are fifteen feet high.

507. (*President.*) What cubic contents does that give?—About 1,400, I think.

508. (*Mr. Martin.*) Is it as much as that?—Very nearly.

509. (*Sir Thomas Phillips.*) What is the length of your ward?—Somewhere about sixty feet, and besides this, in the recesses of the windows, we have additional space.

510. How many beds are there in the ward?—Fourteen.

511. You say about 1,400 feet?—Yes; I think beyond that is lost space; the new London hospitals are all going upon 2,000 to each patient.

512. (*Mr. Alexander.*) You have some phthisical wards, have you not?—Yes; I do not think that the hot air ever does,—patients cannot endure it, it is so heavy, close, and exhausting. We have them fitted to all our hospitals, but we never use them.

513. Have you tried hot water?—Yes.

*Sir J. Liddell,
C.B.*

13 May 1857.

The witness withdrew.

Adjourned to Friday next, at One o'clock.

Friday, 15th May 1857.

PRESENT :

The Right Hon. SIDNEY HERBERT, M.P.
A. S. STAFFORD, Esq., M.P.
Sir H. K. STORKS, K.C.B.
Dr. ANDREW SMITH.
T. ALEXANDER, Esq., C.B.

Sir THOMAS PHILLIPS.
Sir JAMES CLARK, Bart.
J. R. MARTIN, Esq., F.R.S.
Dr. JOHN SUTHERLAND.

PRESIDENT, the Right Hon. SIDNEY HERBERT, M.P.

Sir BENJAMIN COLLINS BRODIE, Bart., F.R.S., examined.

Sir
B. C. Brodie,
Bart., F.R.S.

15 May 1857.

514. (*President.*) You are aware, are you not, of the conditions which are now required in candidates for admission into the army medical service?—I know something of them.

515. You know the diplomas that are required, and you have seen this paper (*handing a paper to the witness*)?—Yes, I have.

516. They are allowed, are they not, to substitute for one course of surgery a course of military hygiene which they may have gone through either at Edinburgh or Dublin, if they choose. Do you think that is a good arrangement or not?—For any special knowledge as to military hygiene, I should think that a military hospital would be better than one of the civil hospitals in the metropolis.

517. The result is this, that young men who have been studying in London come up without having gone through a course of military hygiene, whereas those who have been studying at Edinburgh or Dublin have attended that course, so that the conditions of admission are different to the different students. Do you think that there is a disadvantage in that?—I have always thought that a course of military hygiene, which must include some special matters connected with the military profession, would be much better pursued in a military hospital than in any of our hospitals in London; of course the same observation applies to Edinburgh and Dublin.

518. In addition to the conditions that are required, there is an examination at the army medical department?—I believe so.

519. Do you think that it would be advantageous to have that examination by a Board specially appointed, and who should examine for the navy and for the East India Company; likewise an independent body of examiners?—I think it would be better to be an independent body of examiners, unless you take, so far as they are worth, the examinations of the existing colleges.

520. As another examination is required, and this examination requires speciality on the part of the examiners, would a person in the habit of examining be a better examiner than a person appointed for the purpose at the moment?—There is a great art in examining; and the first thing, so far as I have seen, towards a good examination is to get a good examiner. A man practised in examining must be a better examiner than one who is not practised.

521. So far, a board habitually examining would be better examiners than men appointed for the moment in any one department?—I think so. At our College of Surgeons I do not think any one becomes a very good examiner under two or three years.

522. (*Sir James Clark.*) Do you not think that there are certain professional subjects, such as physiology and pathology, that require a man always in the habit of teaching to conduct an examination?—I think that teachers altogether are the best examiners. They know most about the pupils. It is difficult to get good examiners who have not been teachers. A man conversant with teaching and knowing the habits of pupils generally makes out in a quarter of an hour

what a man is worth. If he is not so conversant, it takes him a long time to do so.

523. (*President.*) You would prefer, would you not, a good general examination, trusting to subsequent experience, to learn the specialities of military surgery?—Yes. I suppose as there are some peculiarities belonging to military hygiene it would be an advantage to have a military element in it, somebody conversant with military surgery.

524. That would depend, would it not, upon whether there existed means out of a military hospital for acquiring it before?—Of course.

525. Are the Commissioners to understand that you think it is better that you should ascertain the general qualifications of a candidate for admission before you admit him, trusting to subsequent teaching to give him the specialities of military hygiene?—Yes, I think so.

526. Will you go farther, and say that you should have a test, not only in medical and surgical knowledge, but in general education?—I think this would be the principal thing, if you can attain it. If you can get young men, who have been previously well educated, and who have acquired habits of study, you may dispense with a great deal of what you require in these papers. A young man entering the profession, who has acquired the habit of attention and study, will generally make everything out for himself better than others will make it out for him.

527. Have you any practice of that kind at the college?—We have with regard to our fellows. The fellows of the college are not admitted until they are twenty-five years of age, which gives ample time for education. They are required to have at least five years of study in the profession, and six years if they have not a university degree. If they have a bachelor of arts degree we require no further examination or testimony as to their general education, but if they have not a bachelor of arts degree they are required to go through an examination by certain examiners whom we appoint for the purpose.

528. Are these examiners university men?—Yes; Mr. Smith, of Oxford, and Mr. Stokes, of Cambridge.

529. You get an equivalent examination to a bachelor of arts degree from them?—Yes, we do so. We require it of the fellows of the college, and we also recommend it to those who only become members.

530. (*Sir James Clark.*) Would it not be better that every student, before he is registered as a medical student, should pass an examination touching his knowledge in science instead of having it done later?—Certainly; we advise our young men to come up for an examination before they begin their medical studies; for if they come up afterwards they are very apt to pass their examinations by getting crammed for the purpose. Indeed a man with a good memory may pass almost any examination with very little knowledge.

531. (*President.*) When first you established that rule for the fellows did you find that there was a difficulty in getting young men to undergo that ex-

amination?—Yes; they did not expect it. We gave notice some three or four years before, but they did not expect it to be so much as it was, and we were forced to lower the standard of examination, and we have not got it quite up to the original standard yet. It did not work well at first, but it works very well now.

532. The fact is, that if you make a change in the examination it is some time before you get the public to adapt themselves to it?—Yes.

533. If you give them time there is hardly anything that they will not do?—Certainly. In the course of time we hope to have no young men coming up not thoroughly well educated.

534. In the case of the army would you think that it was a wise thing or not to have a second examination, either upon promotion or at some period after his admission into the army, with a view to enforce a certain amount of study upon a young man at the time that there is a great temptation to idleness?—Yes, probably this would be right to prevent them getting rusty.

535. When a young man goes into a profession, in which he has not the stimulus of a fortune to be made by private practice, but is sure of his rank after a certain number of years, he may pay much less attention to the study of his profession, and it would be wise in that case to have a second examination?—Yes.

536. As in the case of the navy, where the officers go through an examination upon promotion?—Yes, I believe naval surgeons now are sent to our college for a second examination before they are promoted; at least they were so while I was an examiner some years ago.

537. (*Sir James Clark.*) Will you state the subjects upon which the fellows are examined?—Greek and Latin, and geometry and algebra up to a certain point, and one modern language.

538. (*President.*) Do you make a preference as to the foreign language?—We prefer French.

539. (*Sir James Clark.*) If a candidate could show that he had attended to these things before, you would not examine him upon them again. If he could show, for instance, that he had been a bachelor of arts?—If he is a bachelor of arts of any English university, or of Dublin, we do not require any further examination in arts.

540. But if he has received any education less than that you examine him?—Yes; we limit it to these universities. If there were any equally good educational test we should adopt it.

541. (*Sir Thomas Phillips.*) Would you recommend it as desirable that a person, who you think ought to be examined at some period of his professional career, should also, with reference to that examination, be required to attend hospital practice for any period of time?—I think it would be a very good thing if before promotion you were to give him leave of absence for six months to attend a metropolitan hospital. I believe that that is done with respect to the navy; at least it used to be so.

542. (*President.*) You have seen a great deal of students, you know the destination to which they are going, and you have a general knowledge of the advantages conferred by the army medical profession, should you say that the pay, the rank, the emoluments, and the general position of an army medical officer are such as to attract the best students to the army medical profession, or a fair share of them?—I can only say that I do not believe that I have ever recommended any of our better class of students at St. George's Hospital to go into the army, except into the Guards, where they have some advantages which they do not possess elsewhere. I do not think that there is anything in the army, as it now exists, to remunerate the best educated class of students.

543. And that applies still more to the navy, does it not?—Yes; the situation in the navy is in some respects more disagreeable.

544. (*Mr. Stafford.*) Is it then merely a question of remuneration?—I think that is one thing, and a very important thing. I also think that rank and station are very important. Formerly they never gave the Order of the Bath to a medical officer.

545. (*President.*) There are a good many inconveniences, are there not, to which medical officers are subject in the army which might be remedied?—Yes; if a young man goes as an assistant surgeon into a Light Dragoon Regiment in which there is an expensive dress, and an expensive mess, his pay will not half meet his expenses.

546. His payment to the mess is compulsory, is it not?—I do not know; the inducements altogether are quite insufficient to get the best students.

547. (*President.*) In a service in which the promotion goes entirely by seniority, does not that offer less promise to a young man who is ambitious than one in which promotion would go by selection on account of merit?—Yes; there is no stimulus to exertion where it is merely by seniority.

548. Should you not say that, supposing there were no difficulties in the way of promotion by selection, a service conducted on that principle would be more attractive to young men of talents and ambition?—Yes, care being taken in making the selection.

549. (*Mr. Stafford.*) Do your impressions of the army medical department result from any communications made to you from young men who have entered it?—I have seen a great many young men who have been in the army and navy too; I did not recommend them, but a certain number went into these services.

550. They expressed regret subsequently?—They were very often dissatisfied.

551. That they had not pursued another course?—Yes, many were.

552. From your communications with them, you probably draw your conclusion as to the whole matter?—Yes, and also from knowing what they get there, and what they may get elsewhere.

553. You consider that those disadvantages are not counterbalanced by other advantages?—I do not know that they are so.

554. (*President.*) Though the element of certainty, with small emoluments, will attract men to a great degree?—I have no doubt that the element of certainty is so important that a moderate addition, so far as pay went, would be sufficient.

555. Does not the element of certainty operate very much more upon men in middle life, than upon very young men?—Perhaps it does.

556. The prospect of rising by merit rapidly would operate more upon a young man than the certainty upon an old one?—I suppose that would be the effect.

557. Do you think, from your acquaintance with young medical men in all the hospitals, that it would be possible for a person examining them to come to a sound conclusion generally upon their merits?—Yes; I think that a person properly qualified would soon know what they are worth.

558. Could you do it by a reference to their case books?—Not by merely making them take all the cases; but I think that if a young man were required to give his notes of a certain number of cases, and to add to them commentaries explaining his reasons for forming such or such a diagnosis, or employing such or such treatment, that those papers would give a very complete knowledge as to what that young man is worth.

559. Prizes are given now, are they not, for notes of cases which are sent in without the names, with a motto attached, to be examined with a view to the distribution of the prizes?—I give an annual prize at St. George's hospital, for the best notes of twelve cases with commentaries attached to them, and I believe that all those who get that prize are deserving young men.

560. You think that is a better test than an essay written upon some medical subject?—Yes; an essay may be taken from books, or somebody may write it for the competitor; but one person cannot make much

Sir

Sir
B. C. Brodie,
Bart., F.R.S.
15 May 1857.

of another person's notes, and much less of his thoughts and reasonings upon them.

561. You think that that is the soundest way of doing it?—Much so. I have no faith in essays.

561.* Can any one form a just estimate of the value of notes of cases with commentaries annexed to them, who has not himself seen the cases from which the notes were taken?—A competent examiner, who forms his opinion by referring, not to books, but to his own experience, cannot have the smallest difficulty in doing so. If notes are taken in a slovenly manner, or manufactured for the occasion, there will necessarily be omissions and discrepancies, which a well-informed examiner will at once detect; at the same time, that as to the commentaries, he will easily determine whether the facts which have been stated do or do not warrant the conclusions which have been drawn from them. At the College of Surgeons, since the higher examination for the fellowship was instituted, this method of testing the qualifications of candidates by requiring them to produce a given number of cases with commentaries annexed to them, has been always adopted. While I was an examiner it seemed to me to answer the purpose perfectly well; and since I resigned my office as an examiner, I have never heard that there was any other opinion on the subject. Yet, in this instance, it can be only by the merest accident that those who inspect the papers can have seen any of the cases which are described.

562. Would a few prizes, either of medals or small annuities to be held for a certain period, give a stimulus to young men in the profession, if offered on the conditions which you have stated?—I believe that to be the only kind of prize worth anything.

563. With regard to the mode of distributing the duties in the army hospitals, do you think that it operates at all to the discouragement or to the encouragement of medical and surgical study in young men. It is stated in the Report of Mr. Cumming and Mr. Maxwell, on hospitals in the East:—"The supply of medical attendance, if it were judged by a single comparison of the number of medical officers of all ranks on duty with the number of patients, would appear larger than it is practically, because the duties of the higher ranks of the service are almost wholly foreign to the professional treatment of sick or wounded. The duties of the inspector general and of the deputy inspectors are altogether administrative; the former is the governor of the hospitals, the latter assist him in the work of general superintendence and control. The sick and wounded are treated by second-class staff surgeons and assistant surgeons, to each of whom wards are assigned." Is that a good practice or a bad one?—I understand from that, that the senior medical officers are not employed in the treatment of patients.

564. Though not employed so directly, they give, I believe, a general supervision; will you describe the practice in a civil hospital?—At St. George's hospital, where I was surgeon for thirty-two years, I managed the patients at the end just as I did when I began. I had just the same duties. The only difference in a civil hospital is that a surgeon who has had a long experience, ought to know his duty better, and to treat patients better.

565. Would it not have interfered very much with your higher class of duties, both scientific and medical, if you had been called upon to perform what are called administrative duties, to look after the arrangements of the hospital, to write requisitions for things required, which is what your house steward does as a matter of course?—I could not have done it. All that is done by other persons in civil hospitals.

566. Your time and knowledge are too valuable, are they not, to be spent in that way?—Yes.

567. You ought not to put upon a man who has acquired valuable medical experience duties which can be performed by others?—You had better keep all his experience for his own special purposes; these are not medical employments.

568. That is the rule which you would lay down, that no medical officer should be employed in anything but medical employments, and that everything necessary for the sick ought to be supplied to his hand?—Yes; and whatever the medical officer required should be done, and there should not be any disputing with him about it. You should take care to have a proper person, and then trust him altogether.

569. With regard to such things as alterations in a hospital for the benefit of the sick, you could not put that in a public department at the option of a medical officer?—That is a medical question very much; he should give his opinion upon it.

570. In a civil hospital I suppose it is the governors who decide upon such points?—Yes; a committee of governors.

571. Therefore you would require some person to receive the report of the medical officer and to act upon it?—If any alteration is made in our hospital the medical officers cannot make the alteration, but the committee always listen to their opinion so far as that opinion goes.

572. Then it becomes really a financial question, does it not?—Very much so.

573. (*Sir James Clark.*) Do you think a committee the best government of a hospital?—I think it is much the best. Our government by a committee here is a great deal better than the public functionaries in Paris. The medical officers in the hospitals there complain very much of the insufficient diet and the little attention that is paid to them; whereas the committee of our hospital never refuse anything that is wanted. The fact is, that a committee of gentlemen will be much more liberal than a Government officer.

574. (*Sir H. K. Storks.*) They are disposing of different funds. The committee in London are disposing of voluntary contributions, and the other has the disposal of funds raised by taxation?—Just so.

575. (*President.*) You have stated that you thought that prizes would act as a stimulus?—Yes.

576. Would it be worth while, for the purpose of attracting the best students, to give any prize for superiority at the first examination?—I have much doubt myself about giving competitive prizes in examinations. It may work very well in schools and colleges, but when you come to professional examinations (I do not speak about the civil service), I do not think that competitive prizes will answer; for, after all, they will be obtained chiefly by those who are crammed by the men of good memories, and not by the men who really work.

577. Though memory is no very great matter, yet no man can be efficient who has not a good memory?—No; but then he may use his memory for different purposes.

578. Still, even cramming for an examination is a test of a very important point, namely, the power of memory?—Yes, it is; but what I mean to say is this, that, if you have a competitive examination, a man who has a very good memory, and, therefore, who has one great element in genius, will have the advantage over a man who, perhaps, with an equal memory spends more time in observing and thinking for himself. It seems to me that a man who thinks will not have the advantage which he ought to have.

579. Therefore, you would limit it to prizes in some shape, such as medals or scholarships given to the junior branches of the profession after they are in it?—I would limit it to one class of prizes.

580. Founded upon cases?—Yes; I believe that the ordinary prizes do very little good. For some years past the teachers in the London medical schools, following the example of University College and King's College, have been in the habit of giving prizes to the students, yet, notwithstanding this, they are found to be not so well qualified for examination at the College of Surgeons now as they were twenty years ago, and the hospital surgeons and teachers are, I believe, all satisfied that those prizes do no good;

may, more than that, that the best men do not get them.

581. You want, do you not, to keep the education more general in the early part of a man's life, and not let him learn the specialities of the profession to the exclusion of general subjects?—Yes; these prizes operate in this manner: A man wants a prize in chemistry, or physiology, or something else. He gets books, reads up his subject, and this kind of work keeps him out of the dissecting room and wards of the hospital, yet these are the only places in which he can get any knowledge that he can apply to practice, and learn to observe and think.

582. In after life, when he is in the army, would it be an advantage then to give prizes, but not for essays?—I have not considered that question enough to give any positive opinion about it.

583. You do it yourself, do you not?—If you can find any means of ascertaining that a medical officer of the army is continuing to improve himself, it would be very well to reward him.

584. But you ought to give some stimulus to encourage him to do so?—Yes.

585. By prizes, or by promotion?—Yes; promotion being the best prize.

586. (*Sir Thomas Phillips*.) With regard to the encouragement of candidates, would you rather depend upon rewards by pay and proper treatment afterwards for the introduction of the best class of men into the profession, than upon special prizes?—Yes; for success in his profession is the greatest prize that a man can have.

587. Pay or reward, whatever else will attract, will attract good men?—If success is not a sufficient prize he can be good for nothing.

588. (*President*.) Pay and rank will attract good men to the profession, but they will not continue good men unless they rise by passing over the heads of the slow ones by promotion?—Certainly. I think that the system of promotion merely by seniority is open to very great objections.

589. Although the other is difficult?—It requires care, no doubt.

590. (*Mr. Martin*.) Do you consider that any person can be led to the highest excellence by pay only; or do you recommend that other inducements ought to be held out?—There are many other considerations, but pay is one.

591. (*Mr. Stafford*.) Will you name some of them?—Rank or station. The not giving the Order of the Bath to medical officers, among whom there are as deserving, and, in fact, as brave, men as among any others, has had a very ill effect upon the medical military service. They considered themselves as put in an inferior grade while they felt that for the most part their attainments were really greater.

592. (*Mr. Martin*.) Referring generally to the requirements of an army surgeon, should you say from all that you have seen, that for one soldier who dies for the want of a delicate surgical operation, hundreds perish for want of attention to the sanitary requirements of the army?—I have not had experience enough of the army service to give much opinion upon that point.

593. Speaking generally from what you have heard, what should you say?—I suppose much more depends upon attention to the sanitary requirements; that is, to prevention, rather than to cure.

594. (*President*.) Are you aware that in the army every recruit is a picked life, and that the soldier is in your hands generally from the age of eighteen to thirty?—Yes.

595. And yet the mortality of the army is double that of the mortality of persons in civil life in London?—Yes, I am aware that in the barracks in Portman Square there used to be a greater mortality than in all the neighbouring districts.

596. That district is the healthiest, as to the barracks, is it not?—Yes.

597. Does not that show that there must be some insufficiency in the conditions of a soldier's life,

either in food, clothing, or his barrack accommodation, or in the habits generated by the service?—Yes, something. I suppose it is a combination of various causes.

598. Is it not much to be attributed to night duty?—No doubt. Exposure to the weather is one cause.

599. But the night duty of the police is considerably greater, and their mortality is not anything like so large?—I do not know.

600. (*Mr. Martin*.) You would therefore consider the preliminary sanitary training, of which you have spoken, in a military hospital, an essential requirement for a young army surgeon?—I think it would be a very proper thing indeed, that after having passed his first examination, and it being proved that he had got all that he could get in other ways, he should pass his time in a military hospital to learn the specialities belonging to the military profession. I do not think that any professorship set up here or in Edinburgh or in Dublin, will answer at all the same purpose.

601. You think that subject to be so important that it ought not to be left to the future contingencies of the service, or the hap-hazard opportunities that an officer may have of acquiring it afterwards?—Certainly.

602. (*Mr. Stafford*.) Have the cases of young men who have entered the military medical department, and subsequently abandoned it for the civil professions, come under your notice at all?—I have not made that any special subject of inquiry.

603. But have they ever come under your notice?—I have known many who have entered the medical military service and have left it. In fact, the chances of obtaining an income in private practice are so much greater, that in spite of the certainty of the military medical profession, a great many leave it.

604. Do you think they stand as fair a chance then as if the years that they had spent in the army medical department had been spent in civil life, or is there any disadvantage?—For the most part, it is a disadvantage to have been employed merely in the public service.

605. (*President*.) They would have seen a less variety of practice, would they not?—Yes; private practice is peculiar. If you are in the army, and have at the same time an opportunity of seeing private practice, it is another thing; but if you serve with a regiment abroad, the man who engages afterwards in private practice must be very much at a loss.

606. (*Mr. Martin*.) Do not you think that the absence of those active competitions which exist in civil life tends to disqualify an army surgeon from entering into that field of competition?—Yes, it does.

607. (*Sir H. K. Storks*.) Do not you think that the life to which a young man is introduced in a regiment is very likely to divert him from the pursuit of his profession?—I should think so, indeed.

608. It would be desirable, would it not, to keep him away from that if possible?—Yes; unless you could lift the young men with whom he associates up to a different standard.

609. (*President*.) In a fashionable cavalry regiment, for instance?—I should think it is a bad education for a young medical man.

610. That is one reason, is it not, for applying artificial stimulants to excite him to study?—Yes.

611. (*Sir Thomas Phillips*.) By the present conditions a candidate who has a diploma from the royal college of surgeons of England may be admitted as a competitor for service in the army?—Yes.

612. As an army surgeon deals largely with medical practice, should it not also be a condition that he should present a certificate or a diploma from some medical body?—Certainly.

613. From the Apothecaries' Hall or the College of Physicians?—Yes; the College of Physicians would be a very fit place, but there is no opportunity of passing that examination at the College of Physicians at present.

Sir
B. C. Brodie,
Bart., F.R.S.

15 May 1857.

Sir
B. C. Brodie,
Bart., F.R.S.
15 May 1857.

614. Until an opportunity could be afforded him to become a licentiate in physic, it would be, in your judgment, essential that he should present a certificate from Apothecaries' Hall?—That he should present a certificate showing that he had the necessary medical knowledge. I do not know that it should be exclusively from Apothecaries' Hall.

615. But from some body that would ascertain that he was conversant with the practice of medicine?—Certainly.

616. Supposing him to be admitted by a board, as has been suggested, you say that he ought to be sent for promotion to some general military hospital?—Not for promotion, but to learn the specialities belonging to the military service.

617. And would it not be desirable, in order to observe his moral qualities and his character for trust and confidence in after life?—It would so far be beneficial to the service.

618. With regard to operative surgery, may it not happen, after a long peace, supposing war to occur, that a large proportion of the army surgeons would be men who could not be familiar with operative surgery?—Yes; they would not be very familiar with it.

619. In all probability that would be so, would not it?—Probably.

The witness withdrew.

WILLIAM FERGUSON, Esq., F.R.S., examined.

W. Fergusson,
Esq., F.R.S.

625. (*President.*) You have heard Sir Benjamin Brodie's examination, have you not?—Yes.

626. Do you generally accord with his views upon the subject of the first introduction into the profession?—I did not hear that part of it.

627. His view is this, that we should not require an acquaintance with special military hygiene from a candidate, or that he should have gone through a course of it before he comes for examination, but that we should test his professional qualifications, and that after he has entered the army service special teaching should be given him in a military hospital; do you agree with him?—I quite take that view.

628. Further, that we should not only require an ordinary knowledge of medical and surgical subjects, but that, supposing we made the profession sufficiently advantageous, we should get some test of general education besides that which is purely medical and surgical?—That would certainly be a great advantage.

629. (*Sir James Clark.*) Do you not think that establishing a class of military surgery at a school is rather injurious than beneficial?—I think that it has been very injurious, as it has been heretofore done in this country.

630. It takes up much of a young man's time that might be better employed, does it not?—Yes. I refer to the system at Edinburgh.

631. (*President.*) Practically has that course been pursued to the exclusion of other important matters?—To a certain extent it has; it is admitted in Edinburgh that it is equivalent to a course of ordinary surgery, but I think that a young man would have been better attending a course of ordinary surgery, getting that special knowledge afterwards.

632. It frequently happens, does it not, that a man does not decide what service he will enter till he has finished his education?—Yes, in that way he gets an independent course of education; independent as to military matters, and independent as to ordinary surgery.

633. (*Mr. Martin.*) But you hold that subsequent instruction in sanitary science is essentially requisite to an army surgeon?—Yes.

634. So much so as to be indispensable?—I should say that it is indispensable before a young man is put into full action.

635. (*Sir James Clark.*) Would you consider it an advantage to have a second examination before an

620. Is that, in your judgment, an evil?—Certainly. I was asked a question before, whether it would not be well for them to come and refresh their memory at a civil hospital to prevent them becoming rusty. I think that my answer to that question applies to this.

621. You think, do you not, that by that means the inconvenience would be remedied so far as it can be remedied?—I think so.

622. Does no other means suggest itself to you?—No; I do not see that there could be much difficulty in doing what has been suggested.

623. (*President.*) You are, I think, of opinion that we may alter the examinations so as to secure the best men if we can get them, but that we shall do nothing unless we so improve the status and the pay of the medical officers as to attract a better class to the examinations?—If you want to get a better class of students you must give them a proper reward for entering the army. You may get as many men as you like, but what they are will depend upon what you give them.

624. You think that now we do not attract our share of the best?—Certainly not.

assistant-surgeon was promoted to be a surgeon, after being two or three years in the service, in order to test him as to his knowledge of his special duties, and his general professional information?—Yes, I think that would be very advantageous indeed; it would keep a young man to his studies, and you would have a better style of man afterwards.

636. (*Mr. Martin.*) Do not you consider that it would be a great advantage to give facilities to medical officers on their return from our foreign possessions, to have recourse to civil instructions in our great cities, in order to renovate and improve their medical and surgical knowledge?—Yes, it would be a great advantage that that should be encouraged to the utmost. Already in my experience, men coming from abroad, have in considerable numbers gone to schools, and I think if there was greater encouragement given to this practice, and if it were made peremptory it would be highly advantageous.

637. You would have it imperative and not permissive?—Yes.

638. (*President.*) Would you make it imperative upon all?—I think it would be a great advantage.

639. You would not trust to its being used as an element in the consideration of promotion?—You mean if one attended and another did not.

640. Yes; that that should be considered?—I should say that the one who attended would be in all probability the best man; it would show a higher class of mind, and he would assuredly have more knowledge than the other.

641. (*Mr. Martin.*) Referring to what you have seen of the condition of medical officers in the army, should you expect that a body of men like them could be led to the highest point of excellence by money recompence, or that something else should be superadded?—I think that something else should be superadded in all deserving cases.

642. (*Sir Thomas Phillips.*) Do the present inducements to enter the army medical department tempt the best class of men or a fair proportion of the best class of men to enter the service?—No, that is not my experience; although some first-rate men do enter the army medical department every now and then, I should say that, as a rule, the better men do not.

643. Do you regard that as originating in the insufficiency of the motives that are held out by pay and rewards for good conduct, and various other elements?—Yes, there is not sufficient inducement.

644. Do you advise the best men to enter the military or naval medical service?—Not just now, because the inducements are not sufficient.

645. If greater inducements were held out, do you not think that good men would enter?—Yes, undoubtedly they would; they would be advised to do so by their friends and those who are judges.

646. (*President.*) Do you think that a system in which a great deal of drudgery and labour as to the supply of the hospitals is thrown upon the senior medical man is a wholesome one?—I think that it is very objectionable indeed. It seems to be converting a medical man into a clerk.

647. It is stated in the report on the state of the hospitals in the East, that “the supply of such articles in the wards is in practice thrown, in these establishments, on the medical officers in charge of wards, whose requisitions, as we have already noticed, need the counter-signature of the staff surgeon of the division. We think that this duty should not be cast upon the medical officers. It is, in our opinion, an evil that the wards of a hospital are not furnished with their periodical supply of sheets, shirts, and even of fuel or candles, or obtain their full complements of bedsteads, bedding, and other articles of furniture, without a formality which encroaches upon the time and interferes with the legitimate duties of medical men.” Do you agree with that?—Quite so; I think that other people should take charge of it. I think that a medical officer ought to have the privilege of complaining when he sees anything wrong, and that the greatest attention should be paid to him.

648. And of ordering anything additional, in reason?—Yes.

649. The check being, not that the person whose business is to supply should refuse, but that the question should be referred to some higher authority?—Yes.

650. (*Mr. Alexander.*) Whatever you conceive to be necessary for a patient, you consider should be immediately supplied?—Yes; if a medical man orders it, it ought to be supplied, and he should have the smallest trouble in getting it.

651. (*President.*) So with regard to the diet, you would not trust to those things which are called comforts of a patient being ordered as extras; you would think that the general kitchen of a hospital ought to produce all that would be useful for a patient, and that only expensive things should be deemed extras?—Yes.

652. (*Mr. Alexander.*) You would have whatever you ordered issued?—Yes; and that the medical man should have it without being annoyed in any way; that he should just give an expression of his professional opinion, that it was needful for the patient, and that he should be in no way insecure.

653. (*Mr. Martin.*) You think that the thing should always be done?—Yes.

654. (*Mr. Alexander.*) And the same as to diet and bedding?—Yes.

655. (*Sir H. K. Storks.*) That is irrespective of his own chief, if he were a subordinate medical officer?

—If he has the responsibility, I do not think that his chief has anything to do with it. I speak of a person who is responsible, and who is prescribing and taking charge of a patient.

656. (*President.*) Is not a medical officer who is actually treating a patient a better judge of what the patient wants than the person who merely supervises?—Yes, undoubtedly.

657. (*Mr. Martin.*) You consider that a regimental surgeon is one of the most important officers in the army?—Undoubtedly.

658. More so than a mere administrative officer?—Yes, I should say so.

659. Do you think that any special reward or encouragement should be given to a proved good regimental surgeon, in the way of brevet rank, or in any other way?—Yes; I think that he is as justly entitled to reward as any officers in Her Majesty's service.

660. Would you desire to have chairs established in some military hospital?—Yes; attached to some great institution. Lectures should be given in the schools that might be peculiar to the army medical department.

661. (*Sir Thomas Phillips.*) There are no means, are there, of teaching sanitary science even to civil practitioners?—There is no chair devoted specially to that.

662. (*Mr. Alexander.*) Do not you think with a museum, model rooms, and the treatment of several hundreds of patients, young men, at a large hospital like Netley, will derive great advantage, from attending the clinical lectures?—Yes, most undoubtedly. I have frequently heard suggestions as to the propriety of making a great collection, such as that at Fort Pitt, more available than it seems to be at the present time, associated with some large hospital of greater dimensions altogether than even Fort Pitt, that it might be made useful to young men about to join the army medical service.

663. (*President.*) Could it be made available for accidental cases; the great majority of cases in that hospital were only chronic cases, and not acute cases?—It would be better both ways. You must just take such cases as you can; many of those cases may become acute after all.

664. Where you have a hospital in which men come from abroad, their cases have been acute, but they have become chronic?—Yes.

665. (*Mr. Martin.*) You have to deal with the sequel of acute disease?—Yes; you cannot help that, but those who have seen the acute forms of such diseases will in all probability be attached to these hospitals as seniors, and they will explain to the young men the original features of the diseases, and the young men will be able to recognize such cases when they practise themselves.

666. (*Mr. Alexander.*) There you have an opportunity of studying pathology?—Yes, more so than at any other.

667. And also operative surgery?—Yes.

668. And stethoscopic observations?—Yes, and a very great addition to a man's professional information may be acquired at such institutions, if properly founded.

The witness withdrew.

JAMES PAGET, Esq., F.R.S., examined.

669. (*Sir James Clark.*) You are an assistant-surgeon of St. Bartholomew's Hospital, are you not?—Yes.

670. And lecturer on physiology?—Yes.

671. And one of the examiners appointed by the Board of Control to examine medical candidates for the East India Company's Service?—Yes.

672. How long have you held that appointment?—Nearly two years and a half.

673. How many examinations have taken place in that time?—Five.

674. How many examiners are there, and what are the subjects of examination?—There are four exa-

miners, and the subjects of examination are anatomy, physiology, including comparative anatomy, medicine, surgery, and natural history.

675. How do you conduct your examinations?—We conduct our examinations partly in writing, that is with answers to written questions, and partly also *vivâ voce*.

676. (*President.*) Do the questions vary at each examination?—Each examiner sets his own questions on his own subject at each examination. They are conducted partly by answer to written questions, partly orally, partly by the examination of patients,

W. Fergusson,
Esq., F.R.S.

15 May 1857.

J. Paget, Esq.,

J. Paget, Esq.,
F.R.S.

15 May 1857.

and writing reports of their cases, and partly by operations on a dead body, and by the application of bandages and apparatus.

677. (*Sir James Clark.*) How much time do you require to conduct the whole examination,—how many days?—It requires three complete days and two half days.

678. It takes a week altogether, does it not?—Yes.

679. It takes you a week to be prepared to decide finally?—It takes the examiners more than a week, but the candidates are occupied for five days.

680. On what subject are the candidates most frequently deficient?—I can only answer that from general conversation among the examiners. I should say that there is no subject in which they are specially deficient, except in natural history; some are deficient in one subject, and some in another; the only general deficiency is in natural history.

681. Have you not found the preliminary education of medical men deficient in literature and science?—With regard to preliminary education in science, they give no sign of it at all; generally, all their science is acquired at the medical schools.

682. (*President.*) Do you examine in general knowledge?—Not at all; we only judge of that by the papers written.

683. (*Sir James Clark.*) Which you often find very badly written, do you not?—Sometimes they are.

684. (*President.*) Have you raised the standard as to general acquirements since the commencement of your examinations?—The examiners have no control over the examination into the general acquirements of candidates.

685. On medical points has the examination become higher?—I think it is about the same, but I should say that the qualifications of the candidates have increased.

686. (*Sir James Clark.*) Should there not be a special examination of a student before he is registered as a medical student?—I should think that it would bring a higher class of students to the profession.

687. Is it your opinion that a practical examination in dissections, operations on the dead body, and the examination of diseases, is requisite before a man should be allowed to pass?—I think there should be some such examination before any diploma is given.

688. (*Mr. Martin.*) Especially as to tropical diseases?—The difficulty would be to find a student who had seen tropical diseases at all.

689. Except in the "Dreadnought," and such hospitals?—Yes; but there is no opportunity for the general body of students to study them.

690. Do you require that students should have informed themselves by study upon such subjects?—The examination only goes so far as a student may learn in the general course of instruction.

691. (*President.*) What means have they of subsequently acquiring a knowledge of military medical treatment?—That is left entirely to the regulations of the Company. I have always understood that there is a period in which they study specially for the Company's service after obtaining their commissions.

692. (*Sir James Clark.*) Are you of opinion that the examinations may be made the means of improving the course of instruction at the medical schools?—I do not know that they have had any effect upon the general course of instruction; but, as for the candidates for examination, they have had a very important effect.

693. You have stated that the last examination was very much superior to those which you had at first?—Yes; and I know that it has become customary with those who intend to compete at the East India Company's examinations, to continue their studies for three or six months after obtaining their diplomas, and that with special reference to their examination.

694. You are of opinion that the result of the East India Company's examination has improved the character of medical men?—Yes, of those who intend to be candidates.

695. (*President.*) Except so far as you consider their study for the examination to be a mere cram?—

I know that it is better than that. For example, a student will go through one or two courses of operative surgery on the dead body on purpose for the examination, and I chance to know, that for their ordinary work in answering questions, the course of study which many of them go through is much better than a mere cram.

696. Do you contemplate altering the standard at all, or the nature of the examination by extending it or otherwise?—No; I think that the probability is that it will remain on its present plan.

697. Have you within the competitive examination a fixed standard, which if a young man did not reach he would not get the vacancy though there was none better?—Yes; in one of the examinations the whole number of vacancies was not filled, because some of the candidates in the opinion of the examiners were not fit for the service.

698. (*Sir James Clark.*) What is your opinion of a course of military surgery being taught at the schools?—I think that it would be useless. I think there could be nothing taught, nothing really useful, in London. Students can learn nothing from such lectures, except in the presence of the things spoken of.

699. Therefore, a course of military surgery would be a sham, would it not?—It would be quite useless, and mischievous by distracting the attention.

700. (*Mr. Martin.*) That objection would not hold against instruction in sanitary science at a military hospital?—Not at all; and military surgery I think should be taught there. I accord with what was said before, that every student after obtaining his diploma should have some special education for the military service before entering upon its duties.

701. (*Sir James Clark.*) Would it be well to have a second examination of the assistant-surgeon before he is promoted?—I could not well answer that question, without knowing more of the special duties of an assistant-surgeon as distinguished from those of a full surgeon; as to ordinary hospital practice here, an assistant-surgeon is presumed to be fit to be made a full surgeon when his time comes.

702. (*Sir Thomas Phillips.*) With the view of ascertaining that a man who has been in practice as a military assistant-surgeon for some years has availed himself of opportunities for improvement, you think it is desirable that there should be some examination at a subsequent period of his career?—I cannot speak upon that; I cannot say that it would or would not be desirable from any knowledge of my own.

703. (*President.*) Do you not think that it would be desirable not as a question to ascertain his actual fitness for the rank of surgeon, but as an encouragement to a young man placed in circumstances of great temptation to idleness to pursue a certain course of medical study?—In that view I think it would be of great value.

704. (*Sir Thomas Phillips.*) Having regard to the great advantages of civil practice as compared probably with the more limited practice that he was conversant with, would it not be advisable that before the second examination he should study at some of our hospitals?—The study of seniors at a civil hospital is very limited: those who come there after some years of practice cannot be brought into the general routine of hospital study again; they never become students again.

705. At a military hospital do you think that desirable?—I do.

706. (*Mr. Martin.*) Do not you think that facilities ought to be afforded to medical officers when they return home to re-enter the schools in civil life, and so improve their knowledge?—Certainly; and it is quite usual for them to do so.

707. Do you think that that ought to be permissive, or that it should be rendered imperative in the public service?—I think it might be of great value if rendered imperative.

708. (*Sir Thomas Phillips.*) If the examination tested the qualifications of a man before promotion, the mode by which he would attain competency

J. Paget, Esq.
F.R.S.

15 May 1857.

would be of less importance than the fact that he had become qualified?—Yes, certainly.

709. Will you state to the Commissioners the relative number of the candidates and the vacancies during examinations for the East India Company's medical service?—In one of the examinations I know the number of candidates was inferior to the number of vacancies. Dr. Parkes has a list, and in the first examination it appears that there were twenty-eight candidates for twenty-two appointments.

710. Did you fill up the whole of the appointments? Yes.

711. In the second there were fifty-five candidates for more than forty-two appointments?—They were not all filled up. We considered that of those fifty-five candidates there were thirteen not fit for the service at all.

712. Only giving you forty-two persons qualified?—Yes; in the next examination there were thirty-seven candidates for thirty-seven appointments, and those were filled. In the next examination there were thirty-eight candidates for thirty appointments, and those were filled. In the next there were forty-six candidates for twenty-two appointments.

713. It would seem that in the progress of the examinations the candidates have increased relatively to the appointments?—Yes.

714. It has not apparently had the effect of discouraging candidates, but rather of encouraging them?—Yes, just so; but I think that the number of candidates for appointments would not be an exact reckoning; many would work for appointments, but they would find out before the examination that they were not likely to get them.

715. The inducements to enter the East India Company's Medical Service are very much beyond those offered by the army, are they not?—Yes.

716. In your judgment, are the motives offered to men of good ability and qualifications to enter the army adequate?—I presume there is a want of motive. I think I could say that, except in the instance of those who have a military connexion, the best students very rarely enter the army medical service.

717. You mentioned that many were deficient in natural history mainly. Do you include in that comparative anatomy?—Yes, and botany.

718. Those are the subjects to which you referred?—Yes.

719. Not the more general topics of natural history?—I think I might say the topics of natural history in any department.

720. You have stated that one mode of testing their qualifications is by requiring them to practically examine patients?—We have a certain number of patients whom they have to examine, and each candidate examines one medical and one surgical case, and writes his report on them, with his decision as to the nature of the disease, and the course of treatment that he would adopt.

721. Are the cases selected by you or by him?—They are selected by the examiners.

722. Are they in one hospital?—The cases are generally cases of persons who can move about, and they are taken to the India House and examined there. The medical cases were examined in University College on the last occasion.

723. Has the selection of the disease been with reference to any particular probable duties in after life, or to ascertain their general knowledge?—The intention of the examination has been entirely retrospective, so as to ascertain what the student has learned in the usual course of study.

724. (Sir James Clark.) Have they not two or three cases?—Generally, each candidate examines one medical and one surgical case. We have a sufficient supply of cases to distribute among them, and generally there are some four, five, or six surgical cases to distribute; the candidates do not all examine the same case.

725. They only examine one surgical case each?—One or two medical and one surgical.

726. (Sir Thomas Phillips.) But the one case may be the case of eight or ten of the candidates?—That depends upon the number. With forty candidates we should have not less than six cases of each kind.

727. (Sir James Clark.) Would a similar board be advantageous for examining candidates for the public medical service?—I believe it would be very advantageous.

728. (President.) Upon what ground?—I think that, in general, if students are going to be candidates for appointments, without knowing the exact limit of knowledge that they must reach, they will reach a much higher limit than if they have to study for a mere pass examination. Those who now come to be candidates for the East India Company's medical service cannot tell how much they must know. They only know that they must be better than a certain number of other candidates.

729. That would be the means, would it not, of getting a better class of officers?—Yes.

730. (Sir Thomas Phillips.) You would, in that case have one positive standard of admission applicable to the army, the navy, and the East India Company's medical service?—There is a positive standard in the judgment of the India examiners: but except at the same board there could not be always the same positive standard that the India examiners have assumed: theirs is higher than that for the diploma of any of the Colleges of Surgeons.

731. Assuming one board to examine for the three departments, namely, the East India Company, the navy, and the army, the positive standard would be alike for all the men?—Yes, it might I think.

732. (President.) So far as general knowledge went?—Yes.

733. (Mr. Martin.) You think that, besides those considerations, an examination by teachers and professors of the several sciences would have an advantage over any ordinary board of medical men whether civil or military?—I think so, in the case of competitive examinations. I think that no ordinary board could estimate very well what a student may learn of some of the subjects which are being taught. Most of our courts of examiners have little knowledge of what is being taught in general anatomy and physiology in the schools, the examiners not having been teachers for many years, if ever.

734. (Sir James Clark.) In fact, a man must be occupied with the subject as a teacher to be able to examine?—To be fairly examined in competitions, candidates ought to be thoroughly examined on that which they have been studying, and that can only be done by those who are, or lately have been, teachers.

735. (Mr. Alexander.) You think that if you hold out inducements you will always have a sufficient number of men to come up to any standard?—To a standard fully as high as that of the East India Company's service.

736. (President.) You are not afraid of not getting a sufficient supply of candidates if you make the standard so high?—No, the number has increased. The number of candidates for the East India Company's medical service is really very large; it is, I believe, not less than ten per cent. of all who are diplomized in Great Britain.

737. If the army medical service were improved in position and emoluments and advantages generally, and therefore was competed for in the market with the East India Company, would you lose your candidates?—Yes.

738. To any great extent?—I could hardly tell to what extent, but there would be a more even distribution.

739. Would it not very soon find its level; there would be more good candidates for both, would there not?—Yes.

740. In point of fact there would be an almost unlimited supply?—Yes.

741. (Dr. Andrew Smith.) What is your opinion as to the number of patients that the general practitioners throughout the kingdom will see daily?—It is very

J. Paget, Esq.
F.R.S.

15 May 1857.

difficult to say; there are many who see forty or fifty.

742. Do you think that is the average?—That is above the average; I should say as to those in active practice that it might average twenty; but then they lie far apart. I suppose that those forty or fifty cases mentioned by you are the same seen every day. I suppose that every army surgeon sees every one of his patients every day.

743. Yes.—That would not be the case in civil practice. The majority of chronic cases in civil practice are not seen daily; they would be seen once or twice a week.

744. (*Sir Thomas Phillips.*) You would agree, would you not, with Sir Benjamin Brodie that there ought to be some means, other than a diploma of the Royal College of Surgeons, to show that the candidates for army surgeons have been conversant with medical practice?—Certainly; they ought to be in the full sense general practitioners.

745. In what mode would you attain that knowledge now? Would you do so by a certificate of the Apothecaries' Company?—As applicable to England, that would be a very fair one.

746. Or the extra licence of the College of Physicians?—Yes.

747. That would also be a higher standard, would it not?—I believe not.

748. But a satisfactory one?—Yes; I think it would be sufficient to require that every candidate should possess licences or diplomas qualifying for practice in medicine and in surgery in any part of the united kingdom. A regulation narrower than this, or requiring diplomas from particular colleges, would diminish the number of good candidates for the public services; and the safety of the services against the laxity of certain diplomatizing boards might be secured by the strictness of their own examiners.

749. Suppose a candidate admitted and sent down to the general military hospital for the purpose of special instruction, do you also think that he ought to be for some time regarded as a probationer, in order that opportunities may be afforded of observing his moral qualities?—I do not think that it would be

commonly found that a man deficient in moral qualities would enter the medical department of the army.

750. I mean his general fitness for service; his trustworthiness, obedience, and good conduct?—I think that there might be required something like a confirmation of his appointment after ascertaining his character.

751. (*Sir James Clark.*) From your acquaintance with the habits of medical students, and the great variety which exists in the qualifications required by numerous boards, do you consider that a board placed between those bodies and the public service would be a very useful one?—A very useful one.

752. Both by protecting the service on the one side and raising the character of those bodies on the other?—I should think it quite essential for the service.

753. (*Sir Thomas Phillips.*) Do you agree with Sir Benjamin Brodie, that selection by merit would be a most advantageous means of promotion, supposing it to be attainable?—Yes.

754. Could you suggest to the Commissioners tests that, in your judgment, would facilitate a sound conclusion on that subject?—I hardly know what means there are for determining merit; it might perhaps be determined by the reports or records kept of the conditions of the regiments.

755. (*President.*) You must so do it, to a certain degree, with an army scattered all over the world?—Yes; so far as I can imagine, it would be one of the best tests to take the reports of the regiments, the reports of cases, and the reports of the general sanitary conditions of the regiments.

756. And the opinion of the medical officer in charge, of those serving under him?—Yes.

757. (*Mr. Alexander.*) Do you examine practically on anatomy; do you put a body before the students?—It is not a practical examination in anatomy, but in operative surgery; and during the examination it is usual to ask them questions as to the parts they have exposed.

758. By your examination, they must show that they really know it?—Yes; they must do the operations, and explain them, and they must know all the guides for them.

759. They are not crammed?—No; there can be no cramming for such an examination as that.

The witness withdrew.

Dr.
E. A. Parkes.

Dr. EDMUND A. PARKES, examined.

760. (*Sir James Clark.*) You are professor of clinical medicine in University College, physician to University College Hospital, and also one of the board of medical examiners of the East India Company, are you not?—Yes.

761. Are you satisfied with the results of those examinations generally?—I have only been present at two. I was at the first examination in January 1855, and again at the examination in January 1857, and I was very much struck with the improvement in the candidates. At the first examination I did not think, though there were some extremely good men, that the bulk of them quite came up to my expectation. At the last examination, where there was the large number of forty-six, there were some extremely good men, all the twenty-two men that were chosen were very valuable public servants; and I fancy that the same thing was apparent to the other examiners. There was a great improvement at the last examination over the previous ones.

762. Judging from your experience of that examination, and your knowledge of medical students, and the laxity of many examining boards, you consider the East India Company's examination a very useful and necessary one?—It is, I consider, extremely useful and quite necessary.

763. You think that it has had a good effect in raising the character of medical schools?—It has had a good effect in making many candidates work ex-

tremely hard. I have opportunities of seeing that; now they are working extremely hard for the next examination.

764. In the most valuable branches of the profession, in clinical medicine, and operative surgery, is that the case?—Yes.

765. It is your opinion, is it not, that a competitive examination is useful in stimulating young men to exertion?—It is very useful indeed in stimulating all those who intend to become competitors; a great many intend to become competitors who do not finally become so.

766. Are you of opinion that the candidates for the army and navy medical service should receive special instruction for their future duties after or before they have entered the service?—After they have entered the service; and they should then be instructed fully.

767. Do you think that a second examination after they have been sometime in the service would be useful?—Very useful; but I can scarcely see how it is to be brought to bear now. If it can be done I think it would be very useful. It is done in the navy medical department I understand.

768. (*President.*) Will you state the difficulties which you see?—The difficulties are, as to an officer who has been serving at a foreign station, say New Zealand; he has done his duties well, and he is, perhaps, a valuable surgeon; such a man is not likely, after fifteen years' service, to make a very creditable

examination, but it would be hard to deprive that man of his promotion.

769. Supposing that there were more leave of absence given, how would that affect the case?—That is quite a different thing; if it were possible to have a rotation, so that a man after a certain time in a colony should have opportunities of coming home and making up his lee-way, I think that a second examination would be very valuable.

770. Is it not the practice in the navy, when a medical officer is on a foreign station, that he receives his promotion subject to passing his examination when he comes home?—Yes; but an assistant surgeon is frequently at home. Every three years a ship goes out of commission, and then he has a chance of hearing a good deal of what is going on in his profession.

771. Practically, is it not the case that he studies on board ship?—He may study on board ship, but I suspect that not much is done on board. At the large hospital at Haslar, I suppose there is a great deal done.

772. (*Sir James Clark.*) Supposing a second examination could be established, in what respect should it differ from the first?—I think that the second examination should, to a considerable extent, refer to hygiene and sanitary matters.

773. It should be to test his knowledge of the specialities of his profession, to show that he still retains a knowledge of his profession?—Yes.

774. (*President.*) For these professional peculiarities, would not the service be the very best school that he could have?—Yes, certainly.

775. It is a thing not to be learnt at once, but actually in practice, by observation?—But improvements go on as to details, which he could scarcely learn.

776. If the examination were upon subjects on which he would have had an opportunity of acquiring information, surely he would be better able, would he not, to meet that examination, if he had been on foreign service, than if he had been walking a London hospital?—I do not know that one would restrict the examination entirely to that; I think that a man should have an opportunity of rubbing up the science of his profession, as well as the mere application of it.

777. Even if that second examination were confined to the military part of his profession, you think that it would be better than having only one examination?—Yes, if that can be done without injustice to officers who are thrown in positions where they cannot acquire that knowledge.

778. (*Sir Thomas Phillips.*) The examiner might be able to ascertain whether he had availed himself of his opportunities for study?—To a certain extent, I think that if the examination were conducted on the principles of hygiene, there would not be so much injustice done to medical officers serving on foreign stations.

779. (*Sir James Clark.*) Do you think that the result of that second examination should be taken into account in considering the promotion of an assistant surgeon?—I think it should, to a certain extent. At the same time, if it were possible to take into account the whole of the officer's merits, and his conduct generally, it would be well.

780. You consider the want of a second examination rather an evil in the East India Company's service do you not?—There are not means always of testing a man; I scarcely know how a medical officer could be tested in India with a second examination.

781. Do you think that the public service is now popular among medical students?—It is extremely difficult to ascertain that; I think that if the army were thrown open to competition you would be enabled to see whether it is popular or not; I should say that generally speaking it is not popular. For example, I have known good students prefer the service of the Peninsular and Oriental Company because they are better paid, and it is a more agreeable service.

782. (*Sir Thomas Phillips.*) Why is it more agreeable?—I think that they have more leave and are at home more.

783. (*Sir James Clark.*) Is it your opinion that that would render the service more popular?—If the pay of an army surgeon were increased, and his rank increased, I believe that the service would be extremely popular.

784. (*Sir H. K. Storks.*) You refer to his professional status?—Yes, and to his pension; I think that an army surgeon retiring at the end of twenty-five or thirty years as a surgeon gets such an extremely small pension that it is not a provision for him if he is married. He gets 15s. a day or something like that. I fancy but a small number of men attain to the higher grades of inspector-generals or deputy inspector-generals.

785. (*Sir Thomas Phillips.*) Would you make retirement compulsory at a certain age?—I think that there are many difficulties about that; many are active at an advanced age.

786. As a rule what would you do?—Then I would put the age rather advanced, I think.

787. (*Sir James Clark.*) You would rather apportion the pension to the services than to the rank, would you not?—Yes; I think that it must be apportioned also to the rank, but I would increase it altogether. I think that the pension should be very considerably increased in order to make the service attractive to medical students, and the pay also. I think that promotion in the army is scarcely quick enough.

788. (*President.*) Do you think that you could give an additional stimulus to the profession by offering prizes for reported cases to the army medical officers?—Yes, if it were possible to devise a scheme of recompence of that kind, but at the present moment I do not see my way to it.

789. Sir Benjamin Brodie gives a prize for notes of twelve cases which the students select. They select twelve cases, and each gives his own description of it, and they come in to him with a motto instead of the names; that was the case at St. George's Hospital?—Would you propose to carry out that system in the army?

790. He says that an essay is of no use, for the young men steal other men's thoughts, but that no man can supply a case except one who has been at the bedside of a patient, and he says that these come in, and he gives a prize for them periodically?—It is a capital mode of teaching; but I scarcely know how it would apply after a man had once entered the service.

791. (*Mr. Alexander.*) Could not you test it by the case-book, and by the examining officer going round and examining into this; could not it be tested by the treatment?—It must be comparative, and comparison, if there are many competitors, is very difficult. I may say that we have to make an examination twice every year at our college, where cases are sent in by competitors, and we often have great difficulty in deciding between them as to which is the best. We are employed a long time before we can tell which is the best. The amount of labour is very great.

792. (*President.*) Still you do come to a conclusion?—Yes.

793. That must stimulate the young men to pay great attention to the cases?—Yes, it has a very capital effect upon the students. I do not know how in the army, when men are dispersed in the colonies, the cases are to be sent back and compared.

794. (*Mr. Alexander.*) Do not you think that an examining officer who examines the registers regularly and sees the cases could test which was the best description among them?—I think that he might draw a general conclusion.

795. (*President.*) Do you see the cases?—Yes.

796. Therefore one element is the comparison of the description with what you know to be the fact?—Yes.

797. Sir Benjamin Brodie does not see the cases; he gives his students the choice of any cases that they like?—Yes.

798. Still he comes to a conclusion as to which is the best, and if the examiner does not see the cases

Dr.
E. A. Parkes.
15 May 1857.

Dr.
E. A. Parkes.
15 May 1857.

it does not add to the difficulty if they are in Australia or at the Tower, does it?—I think that there would be no insuperable difficulty in coming to a conclusion, but a great deal of trouble would be involved.

799. It could be done as between competitors in the same hospital, could it not?—Yes.

800. Would it be advantageous to have a periodical publication in which great improvements, or any improvements, or any peculiarities in medicine or surgery, which came under the notice of army medical officers should be published with their names, with the view of giving them some distinction?—I think that it would be a very great advantage indeed, and it would give an opportunity for medical officers distinguishing themselves.

801. Would it be better to have it in a separate journal belonging to the army alone, or to bring it into contact with some civil publication of the same character, so as to make it a general contribution to medical science?—Of course, commercially, it would not pay as an army publication only; it would, therefore, be obliged to be supported by a grant of public money.

802. Would there be advantages on other grounds in bringing it into competition with similar reports from civil practitioners?—I think it would be almost better to make it entirely a separate thing for the army, it being understood that it would not be a paying affair at all. I am afraid that it would be swamped in the mass of contributions from the civil profession. I think it should stand forth as a separate thing as an army publication.

803. (*Sir James Clark.*) In France the Government pay for those publications, that are issued of the character that has been referred to, do they not?—I believe so.

804. (*President.*) Do they issue them to the army medical officers?—I believe so; that is much more possible where the army is chiefly confined to France and Algeria.

805. (*Sir Thomas Phillips.*) Would there not be the means of ascertaining by the cases or returns the absolute merit of a man, though not his relative merits?—Yes.

806. Who have been the examiners for the East India Company's service?—Mr. Paget, Dr. Hooker, Mr. Busk, and myself.

807. Would a board, consisting of about that number of gentlemen, be in your judgment adequate to test the qualifications not only of candidates for the East India Company's service, but of candidates for the navy and army medical service also?—I think that if the number of candidates was very much increased, the board must be increased also.

808. Supposing the candidates to be double in number, what ought to be the number of the board?—I think that the board, as far as the examiners in surgery and medicine go, at any rate, would have to be doubled. I think that there should be six instead of four.

809. (*President.*) Would it be the same examination, or would you have a separate examination for each service?—I have not thought much upon the subject, but I think that it might be an examination altogether.

810. (*Sir Thomas Phillips.*) The motives, of course, ought to be equal, if the standard is the same?—Yes. Medical men are drawn to the one service rather than to the other at present; they would scarcely contend for the navy, where they would contend for the army.

811. You cannot have an identity of advantage in the services?—No.

812. (*Sir Thomas Phillips.*) Are those young men that you examine subject to any kind of approval by the Board of Directors?—We send in a list to the President of the Board of Control, who would have the power of excluding, I fancy, if he wished to do so, but at present he has not exercised any veto.

813. Have all who have been recommended by you been appointed?—Yes.

814. Have any means been taken to ascertain their moral qualities in discipline, obedience, good conduct, steadiness, and punctuality?—We have required a certificate from a clergyman speaking generally to the moral character of the candidate.

815. But none as to his habits?—No; only in general terms.

816. (*President.*) Do you not find that, upon the whole, attainment in a very young man is the best guarantee for moral character?—Decidedly.

817. Though you cannot so regard it in after life.—Yes.

818. You have lately been the superintendent of the Civil Hospital at Renkioi, have you not?—Yes.

819. And you are a Queen's officer?—I was, formerly.

820. Therefore you are acquainted with the internal regulations and organization of army hospitals?—Yes, as existing at that time, and generally, from hearsay, as existing now.

821. Will you state whether you had any powers at Renkioi, as regarded the supplies and the general management of the hospital, with respect to the duties of the purveyor or the engineer, or the servants of the hospital, which are not possessed by a medical man in an army hospital?—I think that my powers as to the purveyor were identical with those of the principal medical officer at a military hospital. I called upon him for the supplies that I deemed necessary for the hospital, and on my authority he furnished them, either obtaining them from the commissariat or buying them in the open market. The purveyor was relieved of all responsibility immediately that he had my order. I took then the responsibility, and became answerable to the Government for the expense which he incurred.

822. Did you give him any table or any list of the things which were to be provided as a matter of course for every patient, or did you give him a separate order for so many beds, and so on?—I furnished the hospital, to a certain extent, before the patients were sent there; and afterwards, when they were sent there, I enlarged the hospital according to circumstances. On my order, he furnished certain wards. I ordered him to furnish a ward for fifty patients, and gave him a list of the articles necessary for that ward. I had the supplies in store; we had them furnished on my requisition. They were sent out from England, and they were taken over by the purveyor at Renkioi, and he then became responsible to the Government at home for them.

823. As you made the original requisition for the stores, your requisition covered things which are not usually given in military hospitals, did it not?—I fancy that everything that I gave was given in the military hospitals after the commencement of the war.

824. For instance, you did not trust to the soldier bringing in his kit?—No; I provided the clothing. Directly a soldier came into the hospital I took from him everything, his knife and fork, cup and clothes, and supplied him entirely with hospital furniture and hospital utensils, the others remaining in store till he went out.

825. That is not the custom in the Queen's army in peace, is it?—No; I believe that it was the custom at Scutari in the war.

826. With regard to the purveyor, the difference of the position which you occupied as compared with an army medical officer was, that the whole responsibility rested upon you; you ordered whatever you chose, and he was to obey without remonstrance?—Yes; he had it in his power, under his regulations, if he supposed an order that I gave him to be extremely extravagant, to refer home to the War Office, but before receiving his answer he was to act upon my order, and to give me the thing under protest.

827. Is there any point in which your position was different?—I think, as far as the purveyor is concerned, the principal medical officer of a military

hospital held precisely the same position with myself; he ordered, and the purveyor supplied.

828. The only difference was that you had a complete list of all the things to be supplied, which were supplied without delay or difficulty?—Yes.

829. With regard to the engineer, how did you stand?—My position was this:—We had a twofold duty to perform; we had to build the hospital, and afterwards to keep it in repair. With regard to building it, the hospital was sent out according to a certain plan, and every kind of store with it.

830. Were you consulted as to the original construction of the hospital?—I saw the plans.

831. (*Mr. Stafford.*) Were you consulted as to the site?—I was responsible for it. I chose the site in conjunction with Mr. Brunton the engineer.

832. (*President.*) What medical officer do you suppose decided upon the construction, or had a veto upon it?—The hospital was constructed by Mr. Brunel, and various medical men in England saw it. I believe Sir James Clark saw it. Before I went out I saw it. I saw Mr. Brunel several times, and I was requested to suggest anything that was desirable, and the plan was laid, I believe, before several medical gentlemen in England. Then, with regard to the site, I was ordered to proceed out to join the engineer, Mr. Brunton, and to choose with him the site. He was especially to judge of the drainage and the water supply, and I was to judge generally as to the sanitary condition of the site, and as to its availability for the purposes of a secondary hospital. Then with regard to the building, certain discretionary powers were left to me and Mr. Brunton to alter the arrangements of the building if we thought it necessary to do so. As it happened, very few alterations were made. Then, subsequently, my powers as to the engineer were, that when the hospital was fully completed, if it had been necessary to alter any part of it I could have called upon him to do so, the War Office instructions being, that I was not to go to any great expense in alterations without a reference home; or if such alterations were so imperative that I did not think they could be delayed, then I was to refer to the commandant at Scutari and get his authority for any great expense. As to any moderate expenses the War Office gave me authority to incur them.

833. Were you empowered to order any alterations as to drainage or ventilation?—Yes, if it had been necessary; if the system of drainage had been imperfect, and a slight outlay would have improved it, I should at once have altered it; but no such thing was required, the whole thing having been done at first on a good plan. Subsequently, had the hospital continued, alterations or repairs would have been rendered necessary, and I should have taken upon myself the responsibility of doing them, always reporting home any expense; that was all. As to the latter part of the question, referring to the servants of the hospital, a certain number were civilian orderlies; over them I had full powers.

834. Were they the hospital corps?—No; they were civilians engaged for that special service, and I could dismiss them, suspend them, or fine them. There were a certain number of soldiers employed; I had the same power over them as the principal medical officers of military hospitals. When they committed any offence I reported them to the commandant of the place, who punished them according to the military regulations.

835. Where did you get them from?—The civilian orderlies were engaged in London.

836. I suppose you had to weed them out very fast?—No; as a body they were an extremely good set of men, and had been well chosen.

837. What previous situations had they filled?—They were very various; we had them almost of every trade.

838. (*Sir H. K. Storks.*) Were they better than the soldier orderlies?—Yes; but we had some very good soldier orderlies. I think that the civilians were better educated, but the soldier orderlies were extremely useful.

839. Which were the most manageable, the soldier orderlies or the civilians?—The civilians were much more manageable; they were a much better class of men; there was less drinking amongst them. I had no trouble with the civilians; the soldier orderlies were of two classes, some of them had been sent on from Chatham to Smyrna, with an increase of sixpence daily to their pay; and when Smyrna was broken up a certain number were sent on to Renkioi; the other soldiers were men who had been sent down as patients, but who had been cured, and they were obtained from the commandant by requisition.

840. (*Mr. Stafford.*) You had no selection with the soldier orderlies?—No.

841. (*Sir James Clark.*) Great care was taken to select the civilians?—Yes.

842. Had you nurses in the wards?—Yes, a small number.

843. Had you as little trouble with them as with the orderlies?—Some of the nurses were very good.

844. How did the nurses and the orderlies work together?—Very well.

845. Do you think that female nurses might be introduced into the hospitals in the army?—I have a very high opinion of female nurses if they have been trained, and are proper nurses. I think it might be made a profession for some of the poorer classes, with proper regulations. At present they are very difficult to get, and some of ours did not behave well, although some behaved extremely well.

846. (*President.*) Had you any difficulty in the management of the patients?—None at all.

847. Had you any military officer in the hospital?—Yes, we had a commandant. In the first instance we had an officer acting as adjutant in command of the troops, Mr. Bennett, of the Seventh Fusiliers. Subsequently, when Smyrna was broken up, Major Chads was sent to Renkioi, and acted to the end of the war in command.

848. Had you the same discipline as in a military hospital?—Yes.

849. The only difference was, that you were a civilian and the medical officers under you?—Yes, they were all civilians.

850. Did you find any difficulty in exercising authority over them?—Not at all.

851. What distribution did you make, did you divide them into ranks?—They were divided into ranks in England at different rates; there were assistant surgeons, and assistant physicians, physicians, and surgeons.

852. Corresponding to the first class staff surgeons?—Yes; and to the second class staff and assistant surgeons of the army. Each assistant surgeon or assistant physician was put in charge of a ward containing fifty patients; a physician or a surgeon would have had charge of a division of ten wards containing 500 patients, if the hospital had ever been in full operation.

853. (*Mr. Stafford.*) What was the largest number you ever had?—640, at one time.

854. (*President.*) Is there any other point in which you had power different from medical officers in a military hospital?—I think the only difference in my position was in the greater power I had of ordering alterations in the hospital by the engineer.

855. (*Sir H. K. Storks.*) You had more power over the orderlies?—I had more power over the civilian orderlies. I could stop their pay or dismiss them.

856. (*President.*) Has the new hospital corps come under your cognizance?—Not at all. From my experience at Renkioi I should say that the principal medical officer ought to have more power over the military orderlies. At present he has not enough power; he cannot in any way punish them but merely sends a report to the military officer who has the power of punishing them; but that does not give him, the medical officer, sufficient power over the orderlies; and I think means should be devised for bringing them more immediately under his control.

Dr.
E. A. Parkes.

15 May 1857.

Dr.
E. A. Parkes.
15 May 1857.

857. Would you carry that so far as to give him the power of dismissal?—I do not know that; but I would go as far as I possibly could without resorting to final measures; perhaps not dismissal.

858. Do you think that the system with regard to the orderlies would work well if they were put, not under the immediate power of the medical officer, but under the commandant?—I think it would work better if they were put under the immediate power of the medical officer and if he had the power of punishment to a certain extent. I think that in many cases the commandant scarcely inflicts the punishment that should be inflicted. Sometimes he inflicts more and sometimes he inflicts less; and the medical officer, who knows the offence and the previous conduct of the man in the hospital, is evidently the proper person to know exactly how much he should be punished; and he should have power to order that a man should return to duty and have so many days drill, or undergo confinement in barracks; or he should have the power of giving good conduct stripes to a man and of taking them off again, reporting, of course, to the proper authorities.

859. Those men being non-combatants?—Being military orderlies. I may state that my observation about the good conduct stripes is merely an illustration of the kind of power that I should wish to see given.

860. You think that those orderlies ought to be under the immediate authority, and ought to receive their punishment, when they do wrong, from the hands of the medical officer under whom they are placed?—Yes.

861. Otherwise he would never have the proper degree of authority and weight?—I do not think he would.

862. Would you propose any alterations in the powers possessed by the principal medical officers in military hospitals?—As far as I understand the powers of the principal medical officer in a military hospital, they are sufficient as to the purveying department, but insufficient as to the general arrangements of the hospital; and respecting the construction of hospitals, he has not sufficient power to get things done that ought to be done, as far as I understand it; he should have a certain power to expend money without reference to anybody within a certain sum; I think he might be made as answerable to the Government for the expenditure of 100*l.* or 200*l.* as any other officer.

863. You are of opinion that no hospital should be built without its site and construction being submitted to the opinion of some competent medical authority?—Yes.

864. And afterwards, when the medical officer is placed in it, questions relating to alterations or repairs or improvements, within certain limits, should be left to the unchecked authority of the principal medical officer?—Yes; always supposing that he reports immediately to the head of his department the alterations which he is making.

865. Would there not be the danger of a man without any check whatever having the hobby of making improvements and making them unnecessarily?—I scarcely think there would be, with the inspectors general of the army. Of course, the limit of expense should be defined, and no great alteration should be made.

866. Do you contemplate that a hospital should exist without any authority in it higher than the rank of the principal medical officer?—There must be a military officer always attached to it, for the maintenance of order.

867. He might be an adjutant?—Yes.

868. Should there not be some person in the position of governor of the hospital, who ought to be supreme, and to have the power of deciding on matters which are too pressing to be referred home?—I scarcely know what things there are which the principal medical officer could not decide.

869. At present the principal medical officer makes a representation to the commandant of any alteration

that may be required, and he, I think, makes a representation to the general commanding the district?—Yes; and probably with a good commandant and a good medical officer, any necessary thing would be done; but I can conceive circumstances in which a commandant, from timidity, or from fear of expending money, may not like to take the responsibility of doing so.

870. Why do you think that this superior authority would be unwilling to undertake a responsibility which the medical man would not hesitate to undertake?—I think that the medical man who is responsible for the safety of the sick, and is impressed with the necessity of action, is far less likely to hesitate.

871. Looking to the large number of our establishments all over the world, and the anxiety at home for economy, would it be safe, in your opinion, to trust so many persons with the power of expending money without a single check upon their opinions?—Of course it is understood that the limit of the expense is not to be very great. Nothing great is to be done; but constantly expenses occur in a hospital, such as the alterations of drains, breaking up drains, alterations of ventilation, and things of that kind, and obtaining barrack furniture which may be immediately necessary, and which the principal medical officer now has no power of expending a single farthing upon, as far as I know; and I think that he should have the same power of ordering those things to be done, and paying for them through the purveyor, as he has of ordering provisions.

872. Those things cannot now be done without reference home?—Reference to superior authorities.

873. (*Mr. Stafford.*) You think that the position you occupied in Renkioi Hospital was that which every principal medical officer should occupy in a military hospital?—Precisely.

874. You were financially responsible to the Treasury?—Yes, to the War Department. My position was not very different from that of any principal medical officer in a military hospital, except that I had the power of expending within certain limits certain sums of money for the improvement of the hospital; the precise limits were not stated.

875. (*Sir James Clark.*) Did you find that power very useful on certain occasions?—It would have been, but the hospital was very new, and we were not there long. I ordered additional furniture when necessary.

876. (*President.*) Could not that have been done in an army hospital in ordinary times?—I fancy that a requisition would have been made to the commandant, and sent on to the barrack department or to the engineer.

877. (*Mr. Stafford.*) At Abydos, for instance, the principal medical officer there had not the same power that you had?—He had not in some respects. I heard him say as to that, that he was anxious to procure some stools for the men to sit upon, and it was months before he could get them.

878. (*President.*) Had he to refer home for leave?—No; but he had to refer up to Constantinople. In my position, if I found them necessary, I should have ordered them to be made.

879. Were the provisions supplied by the purveyor or by the commissariat?—By the purveyor. We had a contract which was made by the commissariat.

880. Who supplied the purveyor? the commissariat?—Yes; he was supplied with anything that he wanted.

881. And therefore, the financial arrangements passed between the commissariat and the Treasury, and not between the purveyor and the Treasury?—In the first place, it was between the commissariat and Treasury; subsequently the War Office directed that the purveyor should take up all the powers from the commissariat, but the commissariat made the contract.

882. With regard to medical comforts, they are not supplied at all by the commissariat, are they?—They

do not generally possess them; when they do, they supply them, such as sugar or rice.

883. Arrowroot or sago?—I do not think they ever have any of those articles.

884. That system worked smoothly, did it?—Quite so.

885. There was no clashing between the commissariat and the purveyor?—Not in the least.

886. (*Mr. Martin.*) You have served in the East Indies, and in the Burmese dominions?—Yes.

887. In one of Her Majesty's regiments?—Yes, the 84th regiment.

888. You saw everywhere there, did you not, that the external causes of disease were very emphatic in their effects upon the soldier's health?—Yes, to a very great degree; almost everywhere.

889. Are you satisfied that a knowledge of such influences is a preliminary necessity for a young medical officer?—Yes.

890. Are you satisfied also that next in order of importance to the discoveries made in physiology within the last hundred years stand the discoveries made as to those external causes of disease which affect organized bodies in our fleets and armies?—Yes.

891. With regard to the welfare of civil communities and organized bodies of men, do you regard sanitary science as of the first importance in medical knowledge, and that the treatment and cure of disease are secondary and subordinate?—Yes.

892. Do you consider that knowledge in sanitary science is a matter which may be picked up in after life haphazard in the course of military service, or that it should be taught as a preliminary step in medical education?—It should be taught, I think, in the first instance as a preliminary.

893. Is a young medical officer now instructed in sanitary science before proceeding on foreign service, or are there any means employed to that end?—I am not aware that there is any special training or special means employed.

894. But you hold such to be an essential requirement?—A very essential one.

895. Is he fit now to examine recruits, and to determine the description of man who is fit for the infantry, cavalry, or artillery before he enters the service?—I can scarcely reply to that question; when I entered the army first it was the custom to give assistant surgeons instruction as far as possible in those branches; and they attended in London: some of them, for that purpose.

896. Does the young medical officer now receive instruction respecting the accoutrements and the clothing of the soldier as suitable to the various climates in which he serves?—I believe not.

897. Should he not be instructed with regard to the construction and arrangement of barracks and hospitals, and the details of the arrangement of hospital expenditure?—Yes; it is most essential that he should be so instructed.

898. Should he not be taught to apportion the accommodation of men in tents, barracks, and hospitals, and to understand what space is required for preserving health in various climates?—Yes.

899. Should he not be informed as to the best modes of conducting the march of troops in different climates, so as to conduce to the preservation of their health?—That is extremely important.

900. Should he not be instructed with regard to the influence of night duties and employment on the health of the soldier?—Yes.

901. Should he not be instructed as to the nature, causes, and treatment of formidable diseases which exist in tropical climates?—Yes; as far as such instruction can be given to him.

902. Is not instruction in all these matters as necessary to him during peace as during war?—Precisely.

903. Would not the public money employed in such preparatory education be amply repaid by the improved health of the soldier under the care of such

officers?—Yes; if you gave the officer power to carry out his hygienic knowledge.

904. Can a medical officer, who is wanting in the preliminary knowledge which has been specified, be a proper person to enter on the duties of the army?—Not to undertake all the duties which will probably fall to him.

905. Has not the want of such a course of preliminary instruction long been felt as a great public defect in the arrangements of the medical department of the army?—I think so.

906. When a medical officer who is deficient or altogether wanting in such hygienic knowledge enters upon the duties of the army, does he not, in after life, to a great degree, acquire such knowledge at the expense of the soldier?—Yes; he will, perhaps, in many cases; that is to say, things occur that may affect the soldier which he might have removed had he possessed greater knowledge.

907. Is any instruction imparted to the young medical officer of the army as to economy of food or the dietary proper in the various climates and colonies in which he may happen to serve?—I am not aware that there is.

908. Does there exist, for the use of young medical officers, any work in the form of a manual of sanitary science?—There are some French works, I do not know of any English, though there are a great many sanitary laws and regulations laid down in various English works on the army.

909. Do you not think that it would be a great boon to have such a manual placed in the hands of young medical officers?—Yes; a good manual of that kind, embracing all the stations of the army.

910. (*President.*) Are those French works practically much used?—I do not know.

911. (*Mr. Martin.*) If commanders of regiments, brigades, or divisions knew that the medical officers possessed medical instruction on those important points, would they not receive them and acknowledge them as their sanitary advisers in everything relating to the soldiers' health?—I believe every good commanding officer would.

912. Would they not be much more likely to do so if the details of the instruction were more definite and certain than they are now?—Yes; anything that gave prominence to that study would be likely to increase its value in the minds of military officers.

913. And the chief medical officer, if so endowed, would stand in the same relation to the Commander of the Forces?—Precisely.

914. Do you think, referring to that, as well as to other scientific questions, that it would be a great benefit if medical officers returning home, whether on sick leave or ordinary leave, were required to enter into the study in the hospitals and institutions of the country?—I think it would be a very desirable thing if it could be done; and a great many of them do it to a certain extent.

915. Would it not be better if it were made imperative?—Yes; I should think it would be better, if it were possible, for the exigencies of the service, to make it imperative.

916. (*Mr. Stafford.*) Have you contributed any paper as to the result of your experience with regard to the influence of climate at Renkioi and in the Dardanelles on disease?—Our experience was very small, for we were really only about seven months in anything like active operations, and our patients were very limited, so that we had not a sufficient basis of facts.

917. Will there be no record of the foundation and practical results of that hospital?—I have drawn up a short report for the Government, embracing the mechanical construction of the hospital chiefly.

918. What was the mortality at Renkioi on the whole?—Three-and-three-quarters per cent.

919. Did you find the convalescence rapid or slow?—Very rapid. The mortality was chiefly among the men of the Land Transport Corps; they suffered very much.

Dr.
E. A. Parkes,
15 May 1857.

Dr.
E. A. Parkes.
15 May 1857.

920. Were you able to draw any conclusion as to the effect of the climate on pulmonary diseases?—We thought it very good for consumptive diseases; many men with very considerable disease of the lungs rallied very much there indeed; and we understood that consumption was uncommon round about among the Turks, but it was more common among the Greeks.

921. What became of the soldiers when they left you; did they go at once to duty in the front?—No, they were generally sent up to Abydos for some time, and then they went subsequently to Scutari, where they joined the general dépôt.

922. So that there was always an interval?—Yes, between leaving the hospital and again entering into active service, a considerable interval.

923. (President.) What arrangements had you for cooking?—We had iron kitchens sent out, and we could cook in each kitchen for 500 patients.

924. Did you cook the ration as it is cooked in a military hospital?—Yes; the kitchens were fitted up very nicely with boilers; we could bake and boil, but we did not steam.

925. Was the ration the same as the army ration?—Yes; it was very much the same as at Scutari.

926. (President.) Did you measure your rations for distribution; were they weighed before cooking or afterwards?—They were weighed before cooking.

927. For each person separately?—No; the meat was sent in to each ward in a net for all the patients on full diet, and another net was sent in containing the diet for all the patients on half diet, and the meat was divided in the ward.

928. After being cooked?—Yes.

929. That is contrary to hospital practice with us, is it not?—I think not.

930. Can you supply any forms or returns that you used?—The only difference in our hospital from that of a military hospital, that I know of, was a plan that I found extremely useful, and which I think might be extended to an army in the field or to any extent; it was the plan of requiring every day from each medical officer engaged in treating the sick a special report stating whether or not anything had been brought under his cognizance as to the diet of the patients, the hygienic condition of the buildings, or any other points which required alteration. We had a printed system of reports every day from every medical officer.

931. If there was nothing wrong the report came in as "*Nil*"?—Yes; and in that way every junior medical officer could represent at once to the head of the hospital anything that was at all wrong or required remedying. I have brought down some copies to show the way in which it worked. I selected the first batch that I took hold of. I took the first month, and I have brought here an account of all the defects that occurred in that month in a particular ward. I will hand it in, and the Commissioners will see how the thing worked (*the form was handed in*).

932. A report in this form was made to you by every officer?—Yes.

933. You think the merit of this is that you get the opinion of a man who would not probably report to the orderly officer?—Yes; and on matters which the orderly officer never has an opportunity of seeing. Every man speaks for his own ward, and I would extend that system to every regiment, during a cam-

paign, to know if a surgeon does not get his medicines, or his requisitions attended to; or if the defects, such as they are, are not immediately remedied. If an officer does not report it is his own fault, and the responsibility of any calamity should fall upon him.

934. (Mr. Alexander.) What diet tables had you?—Extra and common diet.

935. Was that done daily? Did you write the name of every patient every day, or was it extended for a week or a month?—I had a ward diet-book in which a single line gave the number of men and gave the diet for the day. The names of the men were not written down.

936. Did the bed ticket include the man's whole treatment?—Yes; the diet was also inserted in it; the advantage of that was that the soldier saw what his diet was himself, and if he did not get it, he was sure to complain of it.

937. (President.) It was a check upon his not getting the dinner ordered for him if he knew what it was?—Yes.

938. At what o'clock were the rounds gone by the medical men?—They visited the wards at half-past nine in the morning. It was during the winter that we were in action.

939. Then you had not time to make diet rolls for the day, but for the day following?—Yes; they visited them again in the evening, and the orderly officer was obliged to go round twice in the night, generally three times, at uncertain hours.

940. Did any practical inconvenience result from the diet roll being made for the next day?—No; and the medical officer of the ward was allowed to order any extras he pleased; for instance, if a man was particularly ill.

941. Or as a substitute for the diet which had been ordered?—Yes.

942. But that would produce some little confusion of account?—No; for there was a separate sheet kept for such extras.

943. In the French hospitals they order the diet for each day, do they not?—Yes; the visit is made very early.

944. Would it be possible in our service?—Yes, in summer; it was in contemplation for us to do it, by visiting from half-past six to seven o'clock.

945. In India the practice is to make an early visit, and the diet is ordered for that day?—Almost always, I believe.

946. You have seen both practices?—Yes; I prefer the dinner ordered for the day, if it is possible. One must not, however, press the purveyor and steward too much in his store in making up the accounts and weighing out the things.

947. (Mr. Martin.) In India with the subordinate medical department, and a steward who represents the commissariat of the hospital, a thing is ordered and done immediately?—Yes; in India the visit is concluded before half-past seven.

948. (President.) Have you any reason to suspect that there was much malingering of soldiers in your hospital?—We thought that there was very little; we had heard there was a great deal. I asked almost all the medical men as to whether there was or not, and they thought there was very little indeed. The men were always anxious to get back to their duty, but in two or three instances it was not so.

The witness withdrew.

Adjourned till Monday next, at One o'clock.

Monday, 18th May 1857.

PRESENT :

The Right Honourable SIDNEY HERBERT, M.P.
A. S. STAFFORD, Esq., M.P.
Col. Sir HENRY K. STORKS, K.C.B.
Dr. ANDREW SMITH.
THOMAS ALEXANDER, Esq., C.B.

Sir THOMAS PHILLIPS.
Sir JAMES CLARK, Bart.
JAMES R. MARTIN, Esq., F.R.S.
Dr. JOHN SUTHERLAND.

PRESIDENT, The Right Honourable SIDNEY HERBERT, M.P.

JOHN MEYER, Esq., late Medical Superintendent of the Civil Hospital at Smyrna, examined.

J. Meyer, Esq.

18 May 1857.

949. (*President.*) You were formerly in the public service in Van Diemen's Land, were you not?—Yes, I was for nine years in charge of an hospital and lunatic asylum.

950. Were you ever in the Army Medical Service?—Never.

951. You were appointed chief medical officer of the civil hospital at Smyrna, were you not?—Yes.

952. Are you acquainted generally with the rules for admission into the Army Medical Service?—Very generally.

953. You are aware, are you not, what are the diplomas exacted from candidates?—Not fully. I know generally, but I could not be certain that I am correct in it; my attention has never been turned to that subject; generally I am aware of them.

954. Do you think that it is wise to give prominence to the surgical element in the selection of a candidate?—Yes. But I think it most desirable that every man entering the army service should also possess a medical diploma from some one of the bodies authorized to license medical practitioners.

955. On the ground that the majority of cases treated are medical?—They must be medical.

956. In your opinion, from what you have seen, should you say that there is any advantage in exacting courses of military hygiene before a candidate comes for examination, or would you trust to instruction to be given afterwards?—I should think that he would learn that after he had entered the service far better than before.

957. Would you require any test as to his general education?—Certainly.

958. If you can get it?—Yes, as far as possible.

959. On what ground?—A man without a good general education cannot possibly make a good medical man; he must first learn how to learn before he enters upon the profession. Most men enter far too young upon the specific study of the profession itself.

960. Should you say that it would be better that there should be an independent board of examiners or one within the profession itself for the candidates for admission into the Army Medical Service, independent of the army?—Yes, I should think that by far the best plan is that which is now adopted by the East India Company, who select, I believe, examiners from the different schools in London, independent altogether of the service.

961. That makes it necessary that the examination should be one on subjects not specially military?—Yes, but that I should not think would be a matter of any great moment. You want a man of good general education, a practitioner well qualified. He would learn afterwards the specific knowledge required to make a military medical officer.

962. Should you say that it would be an advantage to have any subsequent examination, or would you be content with the examination on admission?—It is a question which I do not feel myself prepared to answer.

963. With a view to encourage young men to come to you, and for the benefit of the medical profession generally, do you think that there would be a dis-

advantage in allowing army medical officers to engage in private practice?—I think not; there are some disadvantages, but I think that the advantages preponderate, and that it would be better to allow them to practise privately and to encourage them to do it.

964. Do you imagine that it would be necessary to make some augmentation of the rates of pay, with a view to attract the best students to the Army Medical Service?—Yes, I should think it would be.

965. And any alteration in the system of promotion as regards selection or seniority?—I should suppose that it would be desirable to adopt some system of promotion by selection, but I am not sufficiently acquainted with that subject to give any positive opinion.

966. In the hospital in which you were engaged at Smyrna were the senior ranks of the medical officers engaged in purely medical duties, or was the internal administration of the hospital entrusted to them?—The internal administration of the hospital was entrusted to them to a certain extent,—they also attended patients; each senior medical officer had a division of the hospital under his charge, and it became part of his duty to see that the internal arrangements were properly carried out.

967. Did he write requisitions for all things that were necessary for the comfort of the patients?—Yes, he had to make them, but a junior could make them too.

968. Those were requisitions for extras, were they not?—Everything required for each individual patient was supplied as a matter of course in the building. A list was made out for every bed and that was provided for every bed. Then there was a scale of diet and authorized lists of extras; those were ordered, and anything further could be procured, if necessary, upon special application.

969. Did you make ranks corresponding to the army ranks?—The pay was different; we distinguished the full physician, the surgeon, the assistant-physician, and the assistant-surgeon.

970. Did you make any regulation that the requisition of the assistant-surgeon for an extra should be countersigned?—No; we trusted to the officer treating in every case to make a requisition for what he thought necessary for the sick; if the senior was not present it was signed by the junior putting "for so and so," the senior.

971. If the senior had been present would he have done it?—It would have gone to him and he would have signed it himself.

972. Though not treating the patient?—For diet the man treating the patient would get the diet.

973. And medicine too?—Yes, without any counter signature.

974. You had a table of diets, had you not?—Yes.

975. What constituted an extra with you?—We had a list of extras and a scale of diets, and articles not included in the scale of diets constituted the extras.

976. But the scale of diet could be ordered, could it not, without any counter signature?—Yes, by the officer treating.

J. Meyer, Esq.

18 May 1857.

977. But not an extra?—Yes, I think I said before, anything extra that might be required

978. Will you give an illustration?—If any article of furniture was required in a division, not diet, then a requisition would be made by the senior officer of the division of the hospital.

979. An article of furniture not included in the list would be supplied, you say, on the requisition of the senior medical officer?—Yes, but the diets and medicines would only require the requisition of the medical officer attending the patient.

980. At first you found that the scale upon which they went was extravagant, did you not, as to orders of that kind?—There was a good deal of extravagance; many of the officers had never ordered diets in a similar way, they had not had experience.

981. Then you established a regular diet scale?—No, I was obliged to limit the extras, and to establish a list of authorized extras, then I got things into order by that and by other means that were taken to check the extravagant orders given by some of the officers.

982. (*Sir James Clark.*) What were the things that were most extravagantly used?—Quantities of wine and extras, such as fruit, oranges, and puddings.

983. (*President.*) Although everything that was used for the ordinary course of the hospital was provided by the purveyor without a requisition, on the other hand the purveyor was bound to provide everything in the shape of an extra, however extraordinary it might be, upon the requisition of the medical officer?—Not if it exceeded, if it was not in the list of authorized extras, in that case the medical officer must come to the superintendent and report his reasons for requesting that such and such an extra not included in the list of authorized extras might be given; but without his authority it could not be given.

984. Then you got the counter-signature of the principal medical officer?—Yes, then the purveyor would give it; that was the rule made, but I do not think that it ever happened, there were many things so authorized.

985. (*Sir H. K. Storks.*) It had three signatures?—Only two; it would go direct to the superintendent. I do not think that the case ever occurred; it was only done to check the extraordinary orders that were given. I do not think that an application was ever made to me to authorize any extra not upon the list; the list was so ample that it could hardly happen; before that many things were ordered by the medical men that were unnecessary, multiplying infinitely the labour in the establishment.

986. (*President.*) In your opinion an assistant-surgeon's orders should never be allowed to go beyond the diet table authorized without a counter-signature?—Yes, the authorized diet table; but that should be so ample as to meet all ordinary cases.

987. (*Sir Thomas Phillips.*) Including in that extras?—Yes, the authorized list of extras.

988. (*President.*) What scale of diet had you; was it the army diet scale?—The army diet scale was increased; it was not found sufficient in consequence of the inferior quality of the meat, and other circumstances there, and the diet scale was increased.

989. Was the form for the diet roll used as a voucher for the amount?—We had a very simple form, not certainly checking so fully the expenditure as the army plan, but simplifying matters very much, and doing away with a considerable amount of the writing ordinarily necessary.

990. So that it was maintainable in war?—It was maintained there throughout; it was introduced under great pressure. The system worked very fairly. I have some of the printed forms, but they are not here.

991. Will you bring them here on Wednesday?—Yes, I will bring them.

992. (*Sir H. K. Storks.*) Had you the ordinary bed ticket?—Yes.

993. What sort of one?—A large bed ticket, and it showed the name of the man, the regiment, the

regimental number, the disease, the diet, and the treatment.

994. So that from the day that a man entered the hospital you could follow the history of his case?—Yes, the whole history.

995. (*President.*) You stated that a medical officer with a counter signature ought to be able to exact from the purveyor whatever was requested; you would make him supreme upon the question of diet?—Certainly.

996. What should be the relation of the medical officer to the hospital superintendent; at Smyrna, you had, had you not, army orderlies?—Some.

997. And some of the new staff corps?—No, none of the new staff corps; we had special civil attendants.

998. How did they work?—There was a difficulty at first, many of them exceeded, went out on leave, and got tipsy, and were irregular in their conduct, but the system of fining was adopted, and one or two were dismissed for very gross misconduct, and after that the attendants behaved uncommonly well. I speak now of the civil attendants.

999. Had you any such authority over the orderlies?—None myself, over the military orderlies.

1000. What course did you take if a military orderly behaved ill?—He was referred to the officer commanding, the charge was brought before him, and he dealt with the offender.

1001. Do you think that there is any evil in a medical man not having a direct authority over the hospital attendants?—My feeling has always been that it would be far better to give the medical man in charge of an hospital the power of punishing for minor offences the orderlies employed as hospital attendants in that hospital; but if they required any heavier punishment, that then they should be handed over to the military authorities, and be considered unfit for employment in an hospital.

1002. (*Sir H. K. Storks.*) Had you any medical officer at Smyrna specially charged with the duties of the hospital?—Yes.

1003. What was the nature of his duties?—He had the general superintendence, and the carrying out of instructions which he might receive from me for the detailed arrangements of the hospital throughout the whole establishment.

1004. In fact he looked after the hospital attendants?—Yes, and the nurses, the number of beds, the wards, the arrangements and classification of diseases, and everything throughout.

1005. Did he look after the books and returns?—Yes; he was the administrative officer. He saw no patients; the medical officer who had that was placed on the ordinary staff, and a gentleman who went out as my clerk, Mr. Goolden, took the duty, and carried it out most admirably to the last.

1006. He was a sort of superior house steward or governor, was he not?—Resident medical officer, we called him.

1007. (*President.*) Did you hold him responsible?—It was impossible for me to see everything carried out, but I went round with him. He was my right hand. He was there at all hours of the day and night.

1008. He was responsible for the cleanliness of the wards?—Yes.

1009. Was he responsible that the patients were properly washed?—No, he would hardly do that—that would come more immediately under the medical officer attending the patient.

1010. He was responsible that all the furniture that was down in that list to be given as a matter of course was actually there?—Yes.

1011. Did he see also that the requisitions were properly obeyed?—He could not be acquainted with every requisition, not minor requisitions; as they would not go through him, he could not know.

1012. Would he be the person to whom a patient would complain?—They would complain to him, and they did complain to him.

1013. He would report to you, would he not?—Yes, he would come to me.

1014. (*Sir H. K. Storks.*) He had the charge of the furniture, had he not?—Yes.

1015. He was superintendent of the hospital, in fact?—Yes.

1016. He had nothing to do with the accounts?—No.

1017. Did he issue any money or make any contracts?—No.

1018. (*Sir Thomas Phillips.*) Had you any authority to suspend an orderly who conducted himself improperly in the hospital?—I never exercised any authority over the military orderlies at all, except at times I might reprimand a man.

1019. Suppose a man to misconduct himself grossly, would you have no power to suspend him?—I could put him into the guard-room, and that was done constantly.

1020. With respect to the education of the medical student, you stated that you thought the specialities of the profession should be obtained after he had been admitted?—As a military medical officer.

1021. Would you have that special instruction insured by requiring his attendance, after he had been accepted, at some military school or hospital where proper instruction in the specialities was given, or would you leave it to the chance of his picking it up?—I suppose that some steps should be taken to ensure it.

1022. You would think it desirable that some steps should be taken to ensure that?—Yes.

1023. (*Mr. Martin.*) If he entered the service wanting in such information altogether, he would be obliged to acquire it at the expense of the soldier's health?—As a junior coming in, responsible duties would hardly be entrusted to him before he had had ample opportunity of learning them.

1024. But accidents of the service might put a junior in charge of troops?—I should think that almost every well-educated medical man would have sufficient information on such subjects.

1025. Such as the prevention of disease?—He ought to have.

1026. Is that taught in any of the public schools by any professor in this country?—I am not aware.

1027. (*President.*) Have you seen anything of the working of the Health of Towns Bill?—No; I have been so much out of England.

1028. (*Mr. Martin.*) You know that there is a Public Officer of Health?—Yes.

1029. Is it not generally the case in a military hospital in peace that the average of patients is about thirty medical cases to one surgical case?—I could not say.

1030. (*President.*) What was it at Smyrna?—The proportion was very large indeed. We had not, I think, out of 1700 or 1800 sick, above 60 or 70 surgical cases.

1031. You did not get the same proportion of surgical cases as you would have had if the hospital had been nearer the seat of war?—No.

1032. (*Dr. Sutherland.*) Who attended to the sanitary affairs of the Smyrna hospital, the ventilation, the drainage, and the lime-washing?—I did myself; at least, I gave the directions.

1033. To whom did you make requisitions for anything which might be required?—I had authority to carry them out myself.

1034. You gave instructions to the workmen yourself?—Yes.

1035. And they were carried out without loss of time?—Yes; immediately.

1036. (*President.*) Had you authority to hire labour?—Yes.

1037. (*Dr. Sutherland.*) Suppose you gave instructions for lime-washing, within what time could the operation be commenced?—When I first went there, there was a good deal to do, and we were employing about 60 workmen in the hospital. Often it was not possible to get everything done immediately;

but after a time the white-washing of the whole hospital, as you saw it, was done.

1038. The order had to pass through no department?—They went direct from me; I had a civilian foreman of the works.

1039. Do you think that in hospital management it is essential that those things should be done with the least possible delay?—I think so; it appeared to me to facilitate the work very much there.

1040. (*Sir H. K. Storks.*) Were the prescribing medical officers of your staff required to enter the diet and extras in the daily diet-roll?—They were required to enter them upon the bed-head board, not further.

1041. (*Mr. Martin.*) Were they not entered on the case-book?—We had no case-books; we should have had them, and we ought to have had them, but it was not done, because it was impossible, at the time I first went out and found the hospital overcrowded with the sick, to introduce the system of case-books.

1042. (*President.*) Would not the majority of the medical officers use case-books for their own advantage?—Of the *serious* cases, many kept notes; and we had a book kept giving an account of the *post mortem* appearances in fatal cases, which was placed in charge of one particular officer.

1043. Had you any one to whom the pathological inquiry was specially entrusted?—It was so far done, but imperfectly, because the hospital had so very short a time to work; and by that time we had no more sick, it broke up.

1044. The diets were entered upon a board at the bed-head?—Yes.

1045. Who collected those diet-rolls and who totalled them?—They were totalled in the division by the ward-master of the division, not by the prescribing officer, but examined and signed by the senior medical officer or the lady nurse of the division.

1046. To whom did he carry them, to the purveyor?—Then they went to the purveyor; duplicates were made, and one went to the cook.

1047. The diet was the diet of the following day?—Yes.

1048. (*Sir H. K. Storks.*) How did you get the supplies to the hospital; was it through the commissariat, or did the purveyor buy them?—There were commissariat contracts, and the purveyor supplied them.

1049. (*Sir Thomas Phillips.*) Was there any limit to your authority to spend money?—There was no express limit in the hospital for what was required for the sick; anything that I felt necessary I considered I had full power to do immediately.

1050. (*President.*) With regard to anything of which you had doubts and of which you did not like to undertake the responsibility, you applied to the commandant there?—Nothing was ever done without his being acquainted with it.

1051. (*Sir Thomas Phillips.*) I alluded to works. —There was a limit mentioned, such as if new buildings were thought necessary to be erected, they were not to be put up unless the officer commanding concurred with me in considering the step absolutely necessary, or without first obtaining the approval of the Secretary of State for War.

1052. (*President.*) Was not that done in the case of the quarantine buildings?—No; that was erecting buildings; the quarantine buildings I had nothing to do with; it was merely as a barrack, not an hospital.

1053. (*Mr. Stafford.*) Practically, you were never fettered at all by considerations of expense?—I never was in any way fettered by considerations of expense, except that one did not wish to exceed; I reported everything that was done; a return was sent home monthly of the expenses.

1054. (*President.*) You would not have felt justified in incurring any large expense?—No.

1055. Were you supreme over all your medical officers?—I had power to give leave of absence or

J. Meyer, Esq.

18 May 1857.

sick leave, up to three months, reporting the circumstances home.

1056. You did not go to the commandant for that?—No; a letter was once received in answer to a report of mine as to sick leave, giving me power to recommend three months' leave of absence for the approval of the commandant; I remonstrated against that, and I received full authority to grant it myself.

1057. (*Mr. Alexander.*) You carried out all the improvements in the sewerage and drainage, did you not?—I had a civilian foreman of the works who understood the matter and who advised me; it was all done by my orders.

1058. Without applying to the commandant?—Yes.

1059. (*President.*) Virtually, you were the governor of the hospital, as well as the chief medical officer?—I suppose I may say so.

1060. (*Mr. Alexander.*) Every one was under you, the orderlies, the steward, and the purveyor?—The purveyor was a military man, and he was under the officer commanding, so far as all matters of discipline were concerned; but in his duties as purveyor he received his requisitions and instructions from me.

1061. (*Sir H. K. Storks.*) How was the washing done at the Smyrna hospital?—It was done by contract at first; we took out washing machines, and they were put up and found to answer uncommonly well; for a very considerable time they were worked by hired labour.

1062. On the establishment?—Yes.

1063. Which answered the best, the contract or the washing machines?—A calculation was made when the hospital was broken up, and the hired labour was found to be so much cheaper that a civilian washerman, a laundryman, was retained specially by Colonel Dickson, who commanded the Swiss legion, in order to continue that plan.

1064. (*Sir Thomas Phillips.*) Was it native labour that you employed?—Yes, Greek labour.

1065. (*President.*) You had female nurses too, had you not?—Yes, and ladies.

1066. Did you find much difficulty arise from the introduction of female nurses?—No, they worked uncommonly well; out of 22 female nurses only one was removed for any misconduct.

1067. (*Sir Thomas Phillips.*) Were they all from England?—Yes.

1068. (*Sir H. K. Storks.*) There were also ladies?—Yes, and a good many were found unfit, from one reason and another, for the work, and several were sent home, and after that those that remained did very well indeed.

1069. (*Sir James Clark.*) Had you a good matron there besides the ladies?—Our matron was not particularly good.

1070. Do you think that the ladies would have been necessary if you had had a good matron?—I think that several of the ladies that we had did the work exceedingly well, and it would have been very difficult to have got a large class of severe cases of fever attended to so well by night and day except by the agency of those ladies, who were thoroughly to be relied on, not only from their superior intelligence, but their devotion to the work; you could not be certain that an orderly would not go to sleep, and a nurse might be gossiping; but in the case of a lady, if you knew that she was there, you might be certain that the men would be attended to.

1071. You think that a small proportion of ladies is useful?—Yes, in serious cases; few are experienced, but they are intelligent, and will carry out the orders given. I do not know that such a vast amount of experience is required.

1072. (*Sir Thomas Phillips.*) You consider the earnest watchfulness of such persons of great utility?—Yes, particularly in severe fever; you may attend a man all the day, but if he is not attended to in the night, you lose more than you gain in the day. We had at one time 200 cases of fever in the Smyrna hospital.

The witness withdrew.

G. Pratt, Esq.

GEORGE PRATT, Esq., examined,

1073. (*President.*) Will you state what rank you hold?—That of purveyor to the forces.

1074. What appointment do you now hold?—I am purveyor of Fort Pitt and the district, and many hospitals are in my district.

1075. You have had considerable experience, abroad as well as at home, have you not?—I was in the Peninsula, in Belgium, in France, and in Canada.

1076. Have you been at the head of any other hospital?—I have been at the head of one or two general hospitals in the Peninsula, after one or two battles.

1077. In peace have you been at the head of any other?—No; only at Chatham.

1078. What other general hospitals are there in Great Britain and Ireland?—One at Cork and one in Dublin; there is only one general hospital in England.

1079. Will you state what your duties are at Chatham?—I can hardly define them.

1080. We will take them in heads?—In the first place, I have to provide provisions of every kind for the hospital.

1081. You do the whole duty of the commissariat?—Yes.

1082. Do you provide beef and bread?—Yes, and groceries.

1083. (*Sir H. K. Storks.*) Do you make your own contracts?—There are none. The meat is supplied by a person who supplies it at so much per pound above the supply for the troops of the district.

1084. He has a contract for feeding the troops?—No, it is a different man. The price of bread is governed by the market price in London.

1085. (*President.*) You take it from a contractor, who contracts to supply it at Mark Lane prices?—Yes, that is so, monthly.

1086. You provide the fuel, do you not?—No, the barrack department; the barrack-master.

1087. And wine?—Yes; every description of that kind of provision.

1088. And you provide all the medical provisions?—Everything connected with the diet of the patients, but not medicines.

1089. The system under which you provide at Chatham is different from that which prevails in a general hospital abroad?—Yes. The commissariat, I fancy provide. In the Peninsula the purveyors supplied everything.

1090. In the general hospitals?—Yes.

1091. And in the regimental hospitals?—No; there was a distinction; the commissariat supplied the regimental hospital, and the purveyor supplied the general hospitals.

1092. At present, by the regulations, wine, &c., is provided by the commissariat; but that does not hold good in England?—No; I purchase the wine, &c., for all hospitals in my district; but at present I am issuing from a supply of wine, &c., that came from Turkey, and which was furnished me by order of the Director-General of the Army Medical Department.

1093. During the war, there was a separate mode of purveying for medical comforts? They were bought in London, were they not, by the purveyor attached to the Army Medical Department, and sent out?—Yes, by a gentleman attached to the Army

Medical Department, with respect to the greater portion.

1094. And that was in lieu of trusting it to the Ordnance, which had previously been the practice?—I believe so. I bought a great deal of the stores that were sent out to the Crimea myself in London under Dr. Smith's directions.

1095. What do you purvey in obedience to warrants, and what do you purvey as a matter of course without requisition?—Nothing. There is a diet-roll in which the names of the sick are entered, and it contains the extras to be issued. Any other requisition upon an emergency is signed by the ordinary medical officer generally.

1096. If a patient comes into the hospital, do you provide him with bed and bedding and so on?—There are beds sufficient for the accommodation of the numbers that the hospital will contain.

1097. You are store-keeper as well as purveyor, are you not?—Yes, within a certain limit. The barrack department furnish the hospital bedding, and I am responsible for it to the barrack-master.

1098. You make indents originally upon the barrack-master for more stores than are required?—The barrack-master supplies a certain quantity of stores for the hospital; those stores are exchanged twice every week, and taken back, the dirty clothes to the barrack-master, and others are brought. There is always sufficient in hand to accommodate the numbers of patients admitted.

1099. Is there a demand for you to produce out of the store-room beds and bedding made by requisition, or are you informed that there is another patient, and then do you supply what is necessary?—The ward-masters have always a sufficient store for the accommodation of any sick that come in. Upon an emergency a requisition would be made for any other supplies required by the ward-masters; the whole equipment of the hospital is under their charge, and it is quite sufficient for the men; the hospital will contain on the average 380 men, and the ward-master has sufficient bedding for the accommodation of those men in the hospital. The wards are all complete, and if 100 men were to come in, there are beds for them immediately.

1100. What is the position of the ward-master?—We have generally had a non-commissioned officer.

1101. Is he a permanent officer there?—They have been. The last, I think, was 13, or 14, or 15 years there.

1102. Are they still on the books of some regiment?—No, they are invalids, out-pensioners.

1103. (*Mr. Martin.*) They are servants of the general hospital only?—Only. In a regimental hospital, men of the regiment are employed.

1104. (*Mr. Alexander.*) To whom are they responsible for the stores?—To me.

1105. (*Sir Thomas Phillips.*) Is there one ward-master for each ward?—No, we have only two ward-masters at Fort Pitt.

1106. (*President.*) Everything is done in obedience to requisition, is it not?—Every extra thing that may be required, out of common usage; a requisition is made for it.

1107. Suppose that upon an emergency there came 20 more patients than the hospital would accommodate, what would you do? Would the medical officer in that case make a requisition upon you for each article of bedding, utensils, &c.?—The ward-master would come and say, there are so many men coming to-night that I want so much bedding for, and he would get it from the store-keeper.

1108. And he has obtained it from the barrack-master?—Yes.

1109. Supposing that the store was empty, what would you do?—Then I would require it from the barrack-master.

1110. Are those indents immediately answered?—Yes, immediately, if the barrack-master has those things in store.

1111. (*Mr. Martin.*) Are you held responsible for the qualities of all the articles supplied?—Yes; but I should explain that the meat and bread in store are subject to the supervision of a medical officer, there is an orderly medical officer who attends every morning to see the meat brought in, and one patient from every ward attends with the ward-master to see it weighed and to see it put on the scale, and then they take it to the cook-house.

1112. In the event of there being a complaint as to the quality, do you assemble a board of officers?—No; I should return it to the butcher immediately.

1113. (*President.*) Are you speaking of things that are supplied to you by the barrack-master?—No.

1114. You make the arrangements for the supply yourself?—Yes.

1115. Therefore you are responsible for the quality?—Yes; therefore if it is reported to me that any article is deficient in quality, I look at it, and if I think so, I immediately return it to the contractor; I reject it immediately.

1116. (*Sir H. K. Storks.*) You do so summarily without a board?—Yes.

1117. (*President.*) Would you obey a requisition for that which by warrant somebody else is bound to supply; suppose a soldier comes in without a kit, would you provide him with a knife and fork and plate?—Yes; by a requisition being made upon the superintendent of invalids; then I have authority from him to purchase any necessary that may be required, and it is charged against the man, but that is an evil; a general hospital ought to provide for the patients everything that is essential to their comfort, and great difficulty was experienced, especially during the war. A ward-master comes to me with a requisition and says, this man wants a pair of shoes or stockings, but I have no power to purchase them. I immediately send it to Colonel Anderson, the superintendent of the invalid dépôt, and then I wait a day or two before I get authority to buy those things, and the man is without knife and fork and spoon.

1118. Do you give him a plate?—They are provided by the barrack department.

1119. Do they actually provide them?—Yes.

1120. (*Sir H. K. Storks.*) What kind of plates are they?—Earthenware; there is a basin and plate provided, and if a patient breaks a plate or basin wilfully, it is charged against him.

1121. (*President.*) In the hospitals in the war those things were not provided?—In the Peninsula we had all those things in store, every essential we had in store; they were very humble wooden trenchers and wooden bowls.

1122. If the purveyor make an indent upon the barrack-master for certain things, plates and so on, and these are not forthcoming, what course does the purveyor take?—That is a thing which I have not experienced, but I should report it immediately; I have always found, with regard to stores that I wanted, if the barrack-master had them I got them immediately. The plates are sent in by dozens and kept in the store, and if a dozen are broken they are replaced immediately.

1123. In time of war what would you do supposing an article was not forthcoming in England?—I should immediately report the circumstance to the principal medical officer, saying "These things cannot be got," for the information of the commandant.

1124. The principal medical officer would go to the commandant?—Then he would send it to the commandant.

1125. What can the commandant do?—He must call upon the barrack-master to explain, if the articles are usually supplied by him; but if an article is not forthcoming in England, a report to that effect should be made to the War Office.

1126. Must it not be referred to London?—Yes.

1127. Imagine the case of the hospital at Constantinople, where there is this difficulty, that you have four or five departments, you have the medical

G. Pratt, Esq.

8 May 1857.

G. Pratt, Esq.

8 May 1857.

department, the purveyor's department, the engineer's department, and the barrack department, from whom the purveyor has to get certain articles; and in every case, if one department fails you must apply again to the fountain head to get redress?—I would get the principal medical officer to authorize me to purchase immediately whatever was necessary for the comfort of the sick. I would purchase it myself. Every officer should do that upon an emergency in the field, such as at Scutari; I would take the responsibility and purchase anything.

1128. (*Mr. Martin.*) There is no regulation imperative to that extent, is there?—No.

1129. Therefore a man who is timid as to his responsibility, would prefer going without the things to taking that course?—I never would allow any discomfort in the hospital.

1130. Have you ever heard of such a thing as a purveyor being afraid of undertaking the responsibility, and going without the things?—I have heard that was the case at Scutari.

1131. (*Sir H. K. Storks.*) Did you ever know that happen at Chatham?—Never; I have been thirty-six years there, and I have been forty-eight years a purveyor.

1132. (*President.*) Can you furnish the Commissioners with a copy of the instructions under which you act?—I have none; the only instructions that I act upon are those in the General Hospital Regulations.

1133. A copy has been laid upon the table, of proposed instructions for purveyors; that is not a substitute, is it, for any existing instructions?—They were printed off from the War Office, and I have had them referred to me.

1134. (*Mr. Martin.*) You hold yourself to be an officer attached to the general hospital service?—Yes.

1135. Does it still hold, that the purveyors supply the general hospitals, while the commissariat supplies the regimental hospitals throughout the army?—I supply the whole of the hospitals in my district, whether general or regimental, without reference to the commissariat.

1136. Is it so still in the British army?—There was a particular arrangement made, I understand, when the staff went out to Turkey, that the commissariat should supply certain articles upon the requisition of the purveyor; but in England, the commissariat never have anything to do with the supplies to the hospitals.

1137. Not to the regimental hospitals?—No; formerly the medical officers of regiments purchased every article of diet, and extras for their own hospital, but now I supply the regimental hospitals, and have done so for years. During the quarter ending the 30th of September last, when my accounts went into the War Office, I had 46 hospitals under my charge, including the invalid depôt at Chatham, the general hospital at Chatham, the garrison hospital at Chatham, and the large hospital at Woolwich, and my expenditure came to very nearly 12,000*l.*, for three months; I furnished nearly 200,000 diets during that period.

1138. What was the extent of your district?—It extended to Norwich, Ipswich, and Landguard Fort, down to Dover, and to Windsor, Hounslow, and all round the northern parts.

1139. (*President.*) In the Addenda to the War Office Regulations, there are some instructions to the purveyors, chiefly in the East; were those specially issued for the use of the army at that time?—Yes. I do not consider myself bound by them. I put into my pocket a memorandum, showing the cost of those hospitals I spoke of, per man. The total diets issued in the September quarter were 197,022; the amount of the expenditure was 11,173*l.* 10*s.* 8*d.*; the average expense of the diets, although they were costly in regard to wine and extras, at Chatham, was 1*s.* 1½*d.* per man. The poor men had been wounded, and those things were required.

1140. (*Sir H. K. Storks.*) Do you reckon in that the pay of the Medical Staff Corps?—Yes; and not-

withstanding the greater portion of the hospital servants were men of the Medical Staff Corps, and instead of 4*d.* a day as paid soldier orderlies they received 1*s.* 3*d.* and 2*s.*, the average cost of the patient did not exceed 1*s.* 1½*d.*

1141. (*Sir Thomas Phillips.*) That does not include medicine?—No, food and drink and attendance.

1142. (*Dr. Andrew Smith.*) Have you no instructions?—No.

1143. You have nothing informing you of what you may do on your own authority, and what on the authority or order of the principal medical officer, and what you cannot do without sanction from London?—I cannot do anything without sanction from London. If the principal medical officer gave me an order to buy anything I should refer it to London.

1144. (*Mr. Martin.*) Before it is issued?—No; if it is urgent I should comply with the principal medical officer's order.

1145. (*President.*) Whom would you refer to in London?—To the Secretary-at-War, the Secretary-of-State.

1146. In point of fact, the chief person who has to decide upon these matters is the Secretary-of-State in London?—Yes.

1147. So that he is virtually the governor of every general hospital in the service?—Yes.

1148. (*Dr. Andrew Smith.*) Did you receive no instructions when you went to Chatham stating what you might do and what you might not do?—Never; I was sent by the Army Medical Board to Chatham; I was sent to relieve the purveyor, and all the guidance that I had for instruction was the old general hospital regulations.

1149. (*President.*) You state that if a case was urgent you would obey the requisition, though you would write up to London?—Yes, I should write up to London to say "I have supplied so and so."

1150. Who decides whether it is urgent or not?—The principal medical officer; I should say to the principal medical officer, "Is this urgently required?" and if he should say "Yes," I should not hesitate any longer.

1151. Who issues the provisions at Chatham?—The steward.

1152. How does he know the amount?—He has a provision ticket, which is an abstract of the diet rolls furnished daily, stating the quantity of provisions required.

1153. Who totals them?—It is the duty of the medical officer who prescribes, and from those diet rolls there is the cook's ticket.

1154. Do you think it is a duty that necessarily devolves upon the medical officer?—I should think that it is very properly delegated to the medical officer.

1155. That is to say that he is the only judge of what diet is suited to a patient?—Yes, nobody but he can decide it.

1156. When he has decided that matter through a whole ward, do you think that the medical officer should total the diet rolls up; could not a clerk do that?—Yes, but the orders are that those totals of all extras are to be written up in words by the medical officer.

1157. Words there must be?—Yes, in words; if it was not totalled in words I should send it back. I should think that that custom was observed in order that no alteration should take place after the medical officer had prescribed. He puts down one for this diet, and one for another diet, then he adds up the number of diets, then the extras are added up, and he puts them down in words at the end. That I think is very necessary, in order that no alteration may take place in the quantity required without its being detected.

1158. (*President.*) You put upon the medical officer the duty of adding up the pounds of meat, and the number of diets, because you think him more trustworthy than any other person?—If it is objectionable that the medical officer should do it, I should make the ward-master do it, and put his initials to it; but

the signature of the medical officer would still be required.

1159. Is a daily nominal roll required?—There is a daily diet roll, and every man's name is inserted, opposite to which the extras are put down.

1160. Is that in addition to what is put on his bed?—That is a different thing altogether.

1161. (*Sir James Clark.*) Is every man's diet repeated every day?—His name is carried on every day in a separate diet roll.

1162. Suppose a ward with 18 men in it, he could say there are six men on low diet, seven on high diet, and five on middling diet.—The names are put down every day; the casualties are upon the diet roll every day, and I do not think that the service could go on without it. It leads to the detection of many errors that might otherwise creep in as to the admissions of men and their discharges. I get the morning states from the different hospitals at Chatham of the men admitted or discharged, from which stoppage returns are made, and if an error is discovered the diet rolls are referred to to see when this man was admitted and what diet he was on, or whether he was discharged or died.

1163. (*President.*) Would not the admission book give you the check that you would require?—No, every man who comes into the hospital is entered on the register. The morning states give us the information when he is discharged or dies, which is inserted in the register; and then the diet rolls are the vouchers for the provisions of this man in the hospital.

1164. That is the nominal roll every day?—Yes.

1165. Besides that you have a board at the bed head?—I have nothing to do with that.

1166. But it is so?—It is in the hospital; that I fancy is written out by the ward-master.

1167. (*Sir H. K. Storks.*) When patients are ordered porter, or wine, or spirits, is the medical officer obliged to make any memorandum or remark upon it?—I fancy not.

1168. You never take exception, do you, to large quantities?—Whatever the medical officer puts his name down for is given.

1169. In your abstract of examination you pass it without any remark?—I have no abstract of examination; there is an abstract of examination received from the War Office, but I have none.

1170. (*President.*) Who cooks the rations?—There are cooks in the kitchen.

1171. Who appoints them?—They have been appointed lately from the Medical Staff Corps.

1172. By whom?—A requisition is made upon the officer commanding the corps, and he sends them.

1173. Among the Staff Corps there are a certain number of cooks, are there not?—There have been many sent who have been taught to be cooks. The custom before that was to engage an out-pensioner, who was hired and paid so much a day as a cook.

1174. That is in the permanent general hospital?—Yes.

1175. In a field hospital what would you do?—Then I must depend upon the regiments.

1176. You would tell off so many men as cooks?—The commanding officer would be applied to for so many servants.

1177. (*Sir H. K. Storks.*) There is no allowance, is there, for a cook as hospital servant?—There is a recent War Office letter allowing a cook to be employed in regimental hospitals.

1178. (*President.*) A new regulation?—Yes, within the last month.

1179. By which there is an extra allowance for a cook?—The cook is allowed to be put upon the pay list.

1180. Before that a man was told off?—Yes, one of the orderlies.

1181. Who might or might not be capable of cooking?—If he was not, another man would be put in his place.

1182. If there were three orderlies, and supposing you were entitled to three for the number in the

hospital, one of them would be told off to cook?—*G. Pratt, Esq.*

Yes.

1183. And the chances would be very small as to any of the three men having cooked before?—Yes, that is in a regimental hospital.

1184. Now, by the new regulation, there is a special allowance made?—A cook is allowed to be employed.

1185. Is a man selected now from his knowledge of cooking?—That depends upon the surgeon of the regiment.

1186. (*Mr. Stafford.*) Who selects those men?—I should think the surgeon of the regiment. I suppose the surgeon applies to the commanding officer for a steady man to be cook.

1187. (*President.*) Who supplies the cooking implements?—The barrack-master, upon our requisition.

1188. Who supplies the fuel?—The barrack-master.

1189. Who pays for the carriage of the fuel?—The barrack-master has a store at the hospital.

1190. (*Sir H. K. Storks.*) Do they supply you with anything that you ask for?—They supply sauce-pans and boilers.

1191. And pudding dishes?—No, those I purchase; I buy gridirons and frying-pans, because the barrack-master's stores will not supply them.

1192. (*President.*) The barrack-master's list is not ample enough?—No.

1193. Supposing it is right that the barrack-master should supply, and that you should not purchase, ought not the barrack-master's list to be enlarged?—Yes, I think so. There is another very essential thing, the barrack-master does not supply the mats for the hospital; he supplies brooms and brushes, but a mat is essential as a broom, and I have been obliged, whenever requisitions have been sent from the regimental hospitals for mats, to refer them to the War Office for authority to purchase them.

1194. Formerly you say that all those supplies were procured not from the barrack-master, but by the purveyor himself?—That is abroad; they were sent out to him from England.

1195. On his requisition?—Immense stores were sent out to two or three places in the Peninsula, Lisbon was one, from which place all things were supplied to the other hospitals.

1196. (*President.*) Do you consider that the purveyor ought to have a list of things which he should supply as a matter of course?—I think that the barrack-master ought to have everything in his store that is essential for the comfort of the sick in the hospital.

1197. Would not it simplify the matter if the purveyor had everything in the hospital?—Perhaps it would. The barrack-master has generally accommodation, but the purveyor has not. At Fort Pitt I have no accommodation for stores; I have a small room, but it is not half large enough.

1198. (*Sir H. K. Storks.*) Have you a store-room for medical comforts?—They are under custody, under lock and key.

1199. Have you a store-room for them?—Yes.

1200. (*President.*) Do you buy them yourself?—Yes; in the ordinary course of things, I should supply everything that the hospital wants.

1201. For everything in the shape of furniture you go to the barrack-master?—Yes.

1202. And for food you go to the commissariat?—The commissariat never supplied food to the general hospitals in England, and they do not now.

1203. You buy the medical comforts, do not you?—I should if I had not any.

1204. (*Sir Thomas Phillips.*) Do you buy the medicine?—That I have nothing to do with.

1205. (*President.*) Is the cooking establishment at Chatham sufficient?—There is no complaint made of it.

18 May 1857.

G. Pratt, Esq.

18 May 1857.

1206. Can you cook in different ways?—The extras are cooked in different ways, such as mutton chops, beef steaks, and puddings.

1207. Have you a kitchen for extras, apart from the general kitchen?—There is but small accommodation. The accommodation for cooking at Fort Pitt has been always deficient, and so it has been in every hospital that I have been in in England for want of proper fire-places.

1208. Have you coppers for boiling?—Yes.

1209. Can you roast?—No; there is an open fire-place, but it is too small.

1210. Can you bake?—There is a small oven.

1211. Could you bake meat?—They could, but it is generally taken up by baked puddings.

1212. The ration is boiled always, is it not?—Yes, invariably.

1213. If variety were wanting, and supposing the medical officer to say that the monotony of living always upon boiled food was bad, are there the means of getting it cooked in any other way?—They might contrive after some time to roast a small piece of meat, but as to roasting large quantities it is out of the question; it is a small range.

1214. (*Sir James Clark.*) In a well-constituted hospital, do you not think that the purveyor ought to have charge of every kind of furniture belonging to the hospital?—It used to be the case, but since the hospitals were turned over to the Ordnance Department, the barrack-master has had everything of the kind under his charge.

1215. Which would be the better plan, in your opinion?—I should say that if there was proper accommodation for the stores, the purveyor should have charge of everything that is required for the comfort of the sick in the hospital, and that he should have nothing to do with the barrack-master.

1216. (*President.*) And that you should not have to go to him for anything?—That is my opinion.

1217. Would you have the purveyor supply those things himself, or get them from the barrack-master and keep them in store?—If the purveyor were independent of the barrack-master, the things would be supplied to the purveyor by the government, and he would have nothing to do with the barrack-master.

1218. At present you are responsible for the care and management and issue of those stores?—At present I am responsible to the barrack-master.

1219. (*Sir H. K. Storks.*) You mean that you are responsible for those that you receive from the barrack-master?—Yes.

1220. (*President.*) In the wards, who is responsible that the articles of furniture are not ill-treated?—The ward-master is responsible to me for the things in the wards, and he has to report to me so soon as he discovers the loss of any articles.

1221. Is he your servant?—He is the servant of the public and the servant of the hospital.

1222. He is not under your authority as your clerks are?—No, not at all.

1223. Is there one in one or two wards?—No; there are two ward-masters for the whole of Fort Pitt hospital.

1224. (*Sir Thomas Phillips.*) Under whose authority are they?—The surgeons of divisions or the principal medical officer.

1225. Who employs the ward-masters or dismisses them?—The principal medical officer.

1226. Who pays them?—I pay them.

1227. (*President.*) Do you issue the pay?—Yes, I pay the whole, because they belong to the establishment.

1228. How is the washing done at Chatham?—The bedding is done by the barrack-master by contract. As to the personal linen, such as shirts and stockings, that is done in the washhouse at Fort Pitt.

1229. Is there a laundry attached to the building?—Yes, a very convenient one; it has not been many years erected.

1230. Is that washing done by contract?—No, I hire men; I have three or four men and a woman.

1231. At what rate will they do it?—Two men receive 10*d.* per diem, one man 4*d.*, one 7*d.*, and the woman 1*s.* 1*d.*, each receiving a ration.

1232. Is that cheaper than by contract?—I think so; the washing costs a little better than a penny a week, per man.

1233. Do you use a machine?—Yes, I have one that I invented some years ago, and I have found great use from it, and I sent some of them out to Scutari.

1234. Do you use wringing machines?—No.

1235. Have you a hot closet?—There is a hot closet there, and a very good one.

1236. That saves a good deal of labour, does it not?—Yes, it saves drying in winter and is very convenient.

1237. (*Mr. Stafford.*) Do you ever fumigate the wards or the linen?—That depends upon the medical officer of the wards.

1238. He orders it, does he?—When it is necessary; the medical officer must give those orders, I have nothing to do with the interior of the wards.

1239. I speak of the linen or the blankets?—That is never necessary.

1240. (*Sir H. K. Storks.*) How do you get the articles necessary for whitewashing?—By requisition to the barrack-master.

1241. And that requisition must be countersigned by the principal medical officer, must it not?—He tells me that it is necessary to whitewash the hospital, and I make a requisition on the barrack department.

1242. (*President.*) If you have a requisition as to repairs I suppose the principal medical officer would call your attention to the deficient state of the roof, for example, and what would be the process, would he bring the requisition to you?—He would send me a memorandum. There is a requisition made every week upon the barrack-master for broken glass or anything of that sort. Then the barrack-master brings this requisition to the engineer's department, and the royal engineer's department by-and-bye effects the repairs.

1243. (*Sir James Clark.*) Supposing that he discovered a leak, what would he do?—Then I should make an immediate requisition, "Roof to be repaired, as it leaks into such a ward."

1244. And would they attend to it?—Yes, immediately.

1245. It would not go to London, then?—No.

1246. (*Sir Thomas Phillips.*) You stated that you thought it would be more convenient that the government should supply whatever was required for the hospital, than that the barrack-master should do it?—I do not see why it should go through the barrack-master.

1247. What do you mean by the government?—A functionary in London—that the War Office should give directions to the Tower.

1248. So that it would be directed to another department rather than to the barrack department?—Yes, to supply me with a certain number of stores necessary for the comfort of the sick at Fort Pitt.

1249. (*President.*) The principal medical officer comes to the purveyor and states that certain repairs are wanted. The purveyor goes to the barrack-master, the barrack-master applies to the engineer, and the engineer, I suppose, applies to Pall-mall?—No, I suppose he has a discretionary power, unless the repair is of very large extent.

1250. Would not it be referred to the commandant to know whether it was necessary to make it, I mean a thing of some cost?—There is a yearly account required for the repairs and alterations necessary, and that goes up with the yearly estimate.

1251. Abroad it would go to the commandant?—The commandant calls upon the heads of departments to give an estimate of what repairs they will require during the next year.

1252. But supposing some accident took place abroad, it would be necessary that it should be referred to the officer commanding the district to have his opinion?—I do not know the custom abroad.

1253. Did you ever know of cases where matters have been referred home which might have been done and ought to have been done by a reference to the superior officer?—That never took place in the Peninsula.

1254. I mean in peace?—I know nothing about it. I have never been in a general hospital abroad in peace.

1255. In all those cases for internal fittings, repairs, drainage, ventilation, alterations in the sinks, and so on, you would have recourse to the process which you have described?—Yes; that is the one.

1256. Do you think that it is as short, as rapid, and as efficient as it might be made?—I think that the hospital establishment ought to be very good judges; the officers ought to be good judges of what was required, and I think that they ought to be trusted as to the outlay.

1257. Do not you think that, in case of a dispute between the different authorities as to whether a thing was necessary, there ought to be on the spot some person to decide at once?—I think that the officer commanding the district would be the proper authority.

1258. Have you nobody in the hospital like a governor, who could decide upon a thing and do it?—No.

1259. With regard to lime-washing and cleansing, that stands in the same way, does it not, on application to the barrack-master?—Yes; all repairs.

1260. You have stated that you never fumigate?—It is never necessary; we change the bedding twice a week.

1261. In the case of washing linen, it is not necessary to fumigate likewise?—Never.

1262. Mr. Dartnell, in his examination before the House of Commons last year, on the Medical Department of the army, was asked, "What do you do in the case of linen, either bed linen or personal linen, that has been used during an infectious disorder?" to which he replied,—"If it is a straw bed, it is destroyed, and articles of clothing are fumigated and washed." He was then asked,—"Who sees to the fumigation?" and he answered,—"They are handed over to the purveyor." Is that correct?—I have never had anything to do with it. I never knew of any fumigation.

1263. He was then asked,—"Is there any means of knowing medically whether they have been sufficiently fumigated?" and his reply was,—"No; I think not." Do you think that that is not an accurate description?—I have been a great many years there, and I never found it necessary to fumigate any bedding. There were cases of cholera some years ago, and then the bedding was burnt.

1264. You are the paymaster of the hospital, are you not?—Yes; I pay all the bills under authority.

1265. Do you issue the pay of all the officers?—No; they are paid by the general agent.

1266. Do you pay any of the servants of the hospital?—Yes.

1267. But not the medical officers?—No.

1268. And you pay no commissioned officers?—No.

1269. Do you issue pay to the patients?—No; I have nothing to do with them.

1270. You keep an account of their stoppages, do you not?—Yes; I keep accounts of the stoppages due to the hospital, which are sent to the paymasters in whose payment the men are.

1271. And the patient gets the balance of his pay when he returns to his regiment?—Yes.

1272. In the case of a man in the invalid hospital discharged from the service, how is the balance of his pay made up?—The paymaster of the invalid dépôt settles with him.

1273. (*Sir H. K. Storks.*) Do you take the men's packs?—Yes, we have a pack-store and a pack-store-keeper.

1274. You also retain possession of any money that they may have, do you not?—Yes, all property—their watches, &c.

1275. (*President.*) Your impression is, that when his kit comes into store, it should not be used for him in the hospital, but that you should supply everything?—I think that the government should supply shirts, stockings, spoons and forks, and everything that is necessary for him in the hospital; that used to be the case.

1276. And you think that these should be in the store?—Yes.

1277. (*Sir Thomas Phillips.*) Why was the alteration made?—I do not know.

1278. (*President.*) That was always the case, you say, in the general hospital?—Yes; when a man came into the hospital his whole kit was put by in the store, and everything was issued to him when he came out of the bath. In the regimental hospitals I fancy that they used their own shirts and their own knives and forks. There is no difficulty there; but in the general hospital men come in there at all times, and they may lose their knives, forks, and spoons. I have known them come without a shirt.

1279. There would be a difficulty with a regimental hospital in the field, in moving so much baggage as would be necessary to provide them with those things?—There would be; it has been attended with the greatest possible inconvenience, the men having their kits to be supplied from, if a man's kit is put into store, and he witnesses the registering of the articles in his pack, if he wants a shirt or a pair of stockings, he applies to the ward-master. Then there is generally obliged to be a requisition for those things from the man's pack; and the packs have to be opened, and the man would say, "It has been opened since it was registered; there ought to be so and so in the pack."

1280. Who is responsible for the cleanliness of the wards?—The medical officer.

1281. But practically, who is responsible?—The medical officer has a ward-master under him, and the orderly has to see that the wards are kept clean.

1282. Who is responsible for the cleanliness of the patients?—The ward-master.

1283. What means are there for washing at Chatham?—Lately there has been an ablution room fitted up; before they used to go to the pump.

1284. How do those men manage who are not well enough to go to the ablution room?—Then they have a hand-basin.

1285. Have you basins supplied?—Yes, by the barrack-master.

1286. And towels?—Yes, for the use of the ward.

1287. What kind of towels?—There are round towels, but there are no hand-towels; the hand-towels I purchase; and there is an anomaly again, for it is not in the barrack-master's list.

1288. (*Sir H. K. Storks.*) Who is responsible for the cleanliness and the sanitary condition of the outside of the hospital and the hospital yard?—The purveyor is responsible for all the exterior and the medical officer for the interior.

1289. (*Dr. Andrew Smith.*) Would it be practicable to ensure the sick having their dinners and breakfasts in proper time provided the diets were to be marked upon the day that they are to be used?—I think not. My steward is up at four and five o'clock in the morning preparing those diets for the kitchen.

1290. Could no means be provided for that to be done?—I do not think so.

1291. (*President.*) What is the hour of dinner now?—One o'clock.

1292. When do the medical officers come round?—They go at this time of the year at 9 o'clock.

1293. There would be no possibility for the purveyor procuring the quantity of meat and the cook cooking it in time for dinner after that period; not even if the medical officers went round earlier?—I think not. I think that the steward should prepare the night before for the issue of diets in the morning.

1294. (*Dr. Andrew Smith.*) How far can you interfere in regard to hospital expenditure? Supposing

G. Pratt, Esq.

18 May 1857.

G. Pratt, Esq.

18 May 1857.

that you go to one of the outstations, or that the diet-rolls arrive from some outstation and you see in them something which appears to you to be extravagant in quantity or in quality, how far can you interfere?—All I can say is, that if I saw anything very extravagant I should write to the medical officer about it.

1295. Supposing that he paid no attention to your representation, what would you do?—If it was very glaring, I should refer it to the War Office.

1296. Not to the principal medical officer at Chatham?—He has nothing to do with it. I would ask his opinion, and if he concurred with me I should immediately report it to the Secretary-at-War for instructions.

1297. (*Sir Thomas Phillips.*) You would obey his requisition in the first place, would you not?—The requisition has been obeyed.

1298. What means has a patient in the hospital of ascertaining the diet he is on and the extras which are ordered for him?—There is a patient from every ward who accompanies the ward-master to the steward's store every morning, and he witnesses and is present during the time that every article is weighed. Then those articles are put into trays and taken in the custody of the assistant ward-master with the patients to the cook-house.

1299. How does a patient in the hospital who does not go to see, know what is his diet: suppose a man is in bed?—I fancy that the diet-roll remains in the ward.

1300. (*Sir H. K. Storks.*) With regard to extravagant extras, do you think that you can be a competent judge of what is necessary for a patient?—No.

1301. You do not think that you could form a correct opinion of what was necessary for a patient?—No. I have no opinion on the matter.

1302. (*Sir Thomas Phillips.*) Supposing bottled porter were ordered, as your supply is limited to draught porter, would you then say that you thought it was costly?—Some time ago an order was given, that when the medical officers prescribed bottled porter, they should explain how it came to be prescribed, it being considered that draught porter was quite sufficient for the cases.

1303. You would require explanation in such cases as that?—I did not require it, but the War Office required it.

1304. (*Dr. Andrew Smith.*) Can an assistant-surgeon in charge of a detachment in your district order mutton to be provided for the ordinary diet, and not simply as an extra for the sick, instead of beef?—Then he should have mutton.

1305. Can he order it?—Yes, they have power to order anything they choose. If an assistant-surgeon wanted mutton, he could get it. Beef and mutton are supplied for the diets alternately; there is so much mutton and so much beef.

1306. (*Sir Thomas Phillips.*) Do you mean that in the diet itself, the alternative is given to him to order either mutton or beef?—Yes, if he chooses.

1307. (*President.*) Do not you furnish confidential reports to the War Office?—Not now, I have never furnished any.

1308. Do you superintend the packing and unpacking of all the stores that are received belonging to your department?—We have very little of that kind. If I had a large quantity of stores to be unpacked, I should see it done myself, or send my chief clerk.

1309. (*Sir H. K. Storks.*) Supposing that you want transport, what do you do then?—I have authority to hire transport. We have waggons and carts, and I can hire horses.

1310. (*President.*) So far as transport is concerned, you have a sufficient establishment?—Yes.

1311. And you are entirely independent in that respect?—I state to the War Office that it is necessary that so and so shall be provided.

1312. In England you are independent as to transport?—Yes.

1313. You are also independent as to the supplies of rations?—Yes.

1314. You are independent as to medical comforts; and you are independent as to such furniture as is necessary for you, but which the barrack-masters do not habitually provide you with?—That is the case. If anything very essential is required in addition to his supply, it is only necessary to refer it to the War Office to get authority for buying it.

1315. That distinction as to the barrack-master's department is entirely an arbitrary one, is it not?—Yes, entirely.

1316. There is no reason, is there, why he should supply one thing and you the other?—No; I see none.

1317. (*Sir H. K. Storks.*) Do you get supplied by advertising for tenders?—No; the settled price of meat for the troops governs my price for the hospital. I pay a halfpenny a pound above the district price paid for the troops; and as long as the man serves us satisfactorily, he is kept on and he supplies it.

1318. (*Sir Thomas Phillips.*) He is not necessarily the man who supplies the troops?—No; but sometimes in a district the contractor for the troops supplies the hospital.

1319. (*President.*) I see that it is your duty to prepare all wills for patients, do you keep a register of them?—Yes.

1320. And you make all the necessary funeral arrangements, do you not?—All the necessary funeral arrangements are made and I defray the expenses, which are repaid to me by the paymasters of the different corps.

1321. (*Sir H. K. Storks.*) Do you keep any defaulters' book?—No.

1322. Not even of the hospital servants?—No.

1323. And do you make no entry of misconduct?—No.

1324. (*President.*) If misconduct happens, what do you do?—When soldiers were employed they were dismissed to their regiments if it was necessary. Those medical staff men that we have now are sent away from the hospital.

1325. Who keeps the default book?—There is none kept. [I find upon inquiry that the principal medical officer has ordered the chief ward-master to open a defaulters' book for the servants of the hospitals.—George Pratt.]

1326. (*Sir H. K. Storks.*) Is there no entry kept of their crimes?—They are sent with a report of their crimes to the commanding officer of the dépôt.

1327. Supposing that a soldier commits any crime in the hospital, do you keep an account of his default?—I never did.

1328. (*President.*) There is a military officer in charge, is not there?—The commandant there used to be a superintendent of hospitals.

1329. There is a default book kept in a regimental hospital, is there not?—I fancy so.

1330. Can you account for that different practice?—No.

1331. Is it not just as necessary that it should be kept in a general hospital?—When we got out-pensioners for servants it was not necessary to keep a default book; they were dismissed immediately if they were guilty of anything. When the dépôt men were sent away if they had committed any crime, an account of the crime was sent with them to the officer commanding.

1332. Do you think that the hospital would be more efficiently served if the independent power which you have as to some articles were extended to all articles; for example, if you were your own commissariat and barrack-master?—I have stated before that the purveyor could supply if the stores were put into his charge, and be independent of the barrack-master.

1333. Upon the whole, would the service be promoted by it?—I think it would; because, for instance, complaints are made very often of the bad washing in the barrack department; and if the purveyor washed the articles, I dare say he would contrive to do it better.

1334. He would have a greater interest, being the person to issue those things, than the barrack-master who is in another department, and who probably does not hear the complaints?—Yes, it would give a great deal of additional trouble, especially to the purveyor, but I think it would be better for the service if that plan were adopted.

1335. It would save you some trouble too, would it not?—Yes.

1336. (*Sir Thomas Phillips.*) There must be some depôt whether in the barrack-master's department or otherwise?—There must be some stores.

1337. (*President.*) You would require additional store room, would you not?—Yes.

1338. (*Sir H. K. Storks.*) Have you any inspection of the hospitals monthly or weekly, in order to find out deficiencies?—The ward-master is responsible to me.

1339. Is there any inspection as to the number of beds and blankets?—That is generally done yearly. I am not responsible. I am responsible to the barrack-master for the stores that he gives me, and if there is any deficiency in my stores I make it good to the barrack-master.

1340. (*Sir Thomas Phillips.*)—And the ward-master to you?—Yes.

1341. (*Mr. Alexander.*) Does the circumstance of the barrack-master holding your stores occasionally cause delay?—No.

1342. If sickness broke out, and you wanted to fit up another hospital, and you had not stores in your possession, you could not get the articles, could you, beyond a certain hour in the evening?—No. During the time that we received such numbers of sick from the Crimea I never found any difficulty in getting what stores I required from the barrack-master.

1343. (*Mr. Stafford.*) Is your position as purveyor satisfactory with regard to the position of the principal medical officer, or do you propose any change in your relative positions that would be more satisfactory?—I have never found any difficulty in carrying on my duty with the principal medical officer.

1344. (*Sir Thomas Phillips.*) There has been no conflict of authority?—No.

1345. (*Mr. Martin.*) Is your duty well defined?—I think so.

1346. (*Dr. Andrew Smith.*) Have any alterations been lately made as far as regards the cesspools at Fort Pitt?—No.

1347. Are they bad?—Very. I have been trying for 20 years to get drains at the back of the hospital.

1348. Whom have you applied to?—To the barrack-master and at quarterly inspections; there is no drainage.

1349. (*Sir H. K. Storks.*) Who makes the inspection?—The barrack-master and the engineer, monthly, and quarterly.

1350. Do you attend those inspections?—Generally; but if requested by the barrack-master I am bound to attend.

1351. Have you pointed out those deficiencies?—I have repeatedly done so.

1352. (*President.*) Are those deficiencies very great?—There is no drainage to the privies, and two or three times these have had to be opened close to the cook-house.

1353. Is the smell very bad?—Horrible. I have known the emptying of those privies kept on for ten days or a fortnight.

1354. Was the health of the hospital affected?—That I cannot speak to.

1355. (*Mr. Alexander.*) Is there no charcoal used for deodorization?—That is often put in.

1356. (*President.*) What answers do you get to your applications?—They have been pointed out at the quarterly inspections. I do not know that I have made any written applications. The other day an alteration was effected. For several years I had been pointing out the state of the drainage. The rats came up from the drains, and they used to burrow

underneath the necessaries, and run about the yard at night. I asked to have gratings put down at the mouths of those drains to prevent the rats coming any further, and after several years it was done about a fortnight or three weeks ago.

1357. Where is the failure in those representations; where does the stoppage take place?—I do not know that.

1358. To whom did you point it out?—To the barrack-master.

1359. Does he enter it, and report it to the engineer?—They generally put it down, they make notes; but why they are not carried out I do not know. I mentioned again about a month ago that those things were necessary; I said, "I beg to draw your attention to this, it is a very simple thing;" and the barrack-master said that it should be done. It was done, and since that I have seen no more rats.

1360. But the more serious defect, that with regard to the privies, has never been remedied?—No; it would take an immense expense to carry out this drain. There are two ranges of privies, one on each side of the kitchen, and once or twice every year they are obliged to be opened and emptied, and the soil carried away in carts.

1361. The next time the barrack-master comes then you point it out again; does he give any reason why it cannot be done?—The expense and the difficulty.

1362. (*Sir Thomas Phillips.*) You used the expression, "immense expense;" what do you mean by that?—An immense drain must be made to carry it off to the river. I should say between five and six hundred yards in length.

1363. (*President.*) What would be the probable cost; would it amount to 10,000*l.*?—No, not so much as that.

1364. Five thousand pounds?—There would be immense drainage required; you must carry it under the street.

1365. (*Sir H. K. Storks.*) Is the hospital at Fort Pitt well ventilated?—Very. I was never in a hospital so sweet and free from any bad smell.

1366. Are the casemates well ventilated?—Yes, very well. There is thorough ventilation in them.

1367. (*Sir James Clark.*) Are not those privies near the wards as well as near the kitchen?—There is a yard between the hospital and the privies, it is about the width of this room.

1368. (*Sir H. K. Storks.*) Do you know how many cubic feet of air each patient has in the hospital?—No.

1369. (*President.*) Whose business would it be to know that?—The medical officer's.

1370. If he complained to you that the wards were over crowded, could you find any remedy?—The medical officer can take upon himself to order so many beds to be taken out of a ward.

1371. Suppose that one ward was empty, and another seemed crowded, but was still within the regulation, what would he do?—Then the medical officer has only to take the patients out of the one ward and put them into the other.

1372. Would it not depend upon the barrack-master issuing food and light?—No.

1373. (*Mr. Alexander.*) Are not the number of patients marked off on the door in each ward?—No; the barrack-master has a scale of the number of patients that the hospital will hold, and it is nothing to him where the patients are put.

1374. (*Dr. Sutherland.*) How often are the wards limewashed; is there any regulation as to that?—Once a year, or oftener if necessary. It all depends upon the medical officer.

1375. (*Dr. Andrew Smith.*) What is that high chimney immediately outside the Fort Pitt gate?—It was to carry off the horrible smell from the privies when the men inhabited the casemates; that is the shaft, but much to the annoyance of the people who go past. It ventilates a series of dark privies below; and I can assure the Commissioners that I have been

G. Pratt, Esq.

18 May 1857.

G. Pratt, Esq.

18 May 1857.

down there, and I have almost fainted from the horrible smell. It has drawn tears from my eyes, worse than any hartshorn bottle that I ever put to my nose. This was for the relief of the people in the casemates, but to the detriment of the public. When the wind is in a particular direction I can smell it for a quarter of a mile.

1376. What distance do you consider the shaft to be from the general hospital of Fort Pitt?—About 20 yards from the casemate and 100 from the general hospital.

1377. Could you never perceive the effluvia when the wind was blowing in a certain direction?—I have smelt it on the parade.

1378. (*Dr. Sutherland.*) Have you ever been in the hospital early in the morning?—Yes.

1379. What is the state of the air in the casemates then?—It is very sweet.

1380. Is it always sweet in the morning?—You have that monster shaft belching out.

1381. (*Dr. Andrew Smith.*) Are you aware that the hospital at Fort Pitt now requires painting inside?

—Yes, it has not been painted, the time has not come round yet.

1382. What is the time?—Once in so many years, six or seven.

1383. Are you aware that that has been represented several times of late?—Yes; Mr. Taylor told me that he had been unsuccessful in his application. He wanted the inside of the cupboards painted, and I think an arrangement was made with the barrack-master; he thought that he could effect some of the parts that required lime-washing himself, and by so doing he thought that he could paint the inside of the cupboards.

1384. (*President.*) That is, I suppose, calculated sufficiently to preserve the woodwork?—Yes, exactly; they do not look after the health, but the woodwork they look to.

1385. (*Dr. Andrew Smith.*) Will you furnish the Commission with a list of all that you consider necessary for the full equipment of a hospital able to accommodate 200 sick, viz.: furniture, bedding, utensils, and personal clothing for the sick?—Yes.

The witness withdrew.

Robert John
Hill, Esq.

ROBERT JOHN HILL, Esq., examined.

1386. (*President.*) You are governor of the London hospital?—Yes.

1387. You were formerly in the army?—Yes, not very long, for about eight years.

1388. Have you any acquaintance with the system of army hospitals?—Nothing more than any gentleman would have who had occasionally visited them.

1389. How long have you been at the London hospital?—Upwards of fifteen years.

1390. Is it a very large hospital?—Yes, one of the largest in London.

1391. Containing what number of beds?—About 340 patients at all times.

1392. There is a committee of management, I presume?—Yes, a house committee.

1393. Will you describe to the Commissioners what the duties are which you perform as governor of the hospital?—I have the general superintendence of the hospital; the interior arrangement and economy of the hospital. In the absence of the house committee I represent the committee; I look to the discipline, and have the entire control of the officers.

1394. What staff have you under you?—The resident staff consists of a resident medical officer, and an assistant medical officer. We have two house surgeons, two dressers, and three dispensers; there is also a resident accoucheur, a matron, and two clerks.

1395. One of those clerks is virtually steward, is he not?—Yes, the first clerk.

1396. And purveyor for the hospital?—He is not exactly the purveyor, but he examines all the provisions that are brought in, and sees that they are of good quality.

1397. Does he contract for them?—No, the house committee contracts.

1398. Is it done by tender, and is the lowest tender taken?—It is given to the lowest tender. Various butchers and other tradesmen send in their contracts.

1399. It is not an open contract, is it?—We do advertize, but we send to a certain number of tradesmen, four or five butchers and four or five bakers.

1400. What is the division of the duties; take the duties of the medical officers. Have they anything to do with the administration of the hospital?—Nothing whatever.

1401. But they have the entire management of the medical departments?—They attend to their professional duties only.

1402. (*Sir James Clark.*) Are all of those resident?—No. I am alluding now to the physicians and surgeons and assistant physicians and assistant surgeons.

1403. (*President.*) What other medical officers have you?—Three physicians, three surgeons, three assistant physicians, and three assistant surgeons, and an obstetric physician.

1404. All of them are entirely confined to their peculiar duties?—Entirely.

1405. Do they exercise any supervision over the servants of the hospital in any way?—None. If they saw anything wrong in the conduct of the nurses, they would make a complaint.

1406. Or if the provisions were bad?—They might, but they are not there at meal times; the dinners are over when they come to the hospital.

1407. To whom would they make any complaint? They would make it, if it were not of any great importance, perhaps to the matron, and if it were of more importance they would probably come in to me.

1408. You say that the hospital is provisioned by contract, the contracts being made by the committee of management?—Yes.

1409. Who practically manages the provisioning of the hospital? who receives the meat, and examines the quality of it?—The first clerk.

1410. Would he have the power of rejecting bad meat?—Yes, undoubtedly.

1411. Does he supply the medical comforts also?—No.

1412. Who does?—They come from the dispensary, and we do so because it is more convenient. Arrow-root and things of that sort may be wanted at any hour of the day or night.

1413. (*Mr. Martin.*) You consider such articles as half diet and half medicine, do you not?—They are not diet at all; the dispensary is always accessible, day and night.

1414. (*President.*) The ordinary diets are entirely provided by the steward?—Yes.

1415. And extras?—Yes, except wine, spirits, &c.

1416. Are the medical comforts not extras?—No.

1417. Have you got the forms which show how your different diets are composed?—There is, for instance, a form, which hangs at the head of the bed of the patient, a ticket on which the medicines and diets are entered by the surgeon or physician under whose care the patient is (*the same being handed in.*) I have brought some diet-rolls here. This is the scale of the diets at the London Hospital (*the same being handed in.*) I have also cut out some old pages out of our diet-books, to show how it is done; how we order meat for each day. This is for the 6th of July 1855, and these were the diets, and the extra diets (*the same being handed in.*) Here is a

page corresponding with it in the cook's book (*handing in the same*).

1418. Will you describe how the diet-rolls get into the hands of the cook from the clerk?—After the surgeons and physicians leave the hospital, at 3 o'clock, a bell rings, and the nurses then go down to the dispensary to settle their books and their diets, and the first dispenser's duty is to see to that; and if any change takes place, the nurses take down those tickets that show that a change is ordered, if not, it goes on one day like another. These books are made up for the regular and the extra diets, they are not totalled, but he puts the number along, and then it is sent to the office to the clerk, and he totals them, and calculates from that total the quantity of meat he wants from the butcher, and he also makes out from that list the cook's book, showing how much meat she will have to receive the next morning, and how she is to dispose of it. Here is a corresponding page in the butcher's book for those diets (*producing the same*). I extracted them to show how the calculation was arrived at. In these calculations we make a very liberal allowance; there are a great many diets to cut and serve out in the ward, and we allow a good supply of extra meat to balance that, it is done in the presence of the patients in the wards.

1419. Do you make a fixed allowance for waste in cooking?—Yes.

1420. What is it?—It is more than a third; we allow a third for waste in cooking, and we make an allowance for carving; this calculation is for beef, and we allow an ounce, for every diet in carving, for bone and for fat in mutton.

1421. (*Sir Thomas Phillips.*) The dietary is for cooked meat, is it not?—Yes; these pages are all connected one with the other, and they show the whole.

1422. (*President.*) These allowances you have found, I presume, to be about that which is necessary?—Yes; and we find it answer perfectly well; the meat sometimes may be a little overdone, but generally speaking it works admirably.

1423. How do you provide furniture at your hospital?—We have an upholsterer who supplies that.

1424. (*Sir Thomas Phillips.*) You have referred to the waste in meat; suppose the diet to be eight ounces, what extra amount of meat do you allow?—We allow more than a third more.

1425. Does the upholsterer supply beds, &c.?—Yes; it is an old hospital, and has been so long established, that the furniture is all perfect; there are repairs of bedding now and then.

1426. Do you order it?—Anything that is wanted is made out in a weekly order-book; during the week they submit many things to me; the matron comes and says "I want so much linen for new sheets, or 100 pair of blankets, shall I put them in my order-book?" I say "Yes;" and it is then entered in the order-book, and laid before the committee. I sign it first, and the chairman signs it and approves it.

1427. (*President.*) Practically, the committee are obliged to defer to your judgment?—Yes; then the next day the different departments write out their orders and leave them on my desk to sign, the orders then go to the tradesmen; there is a blank form from the weekly order-book, with also a blank leaf of the tradesmen's order book (*producing the same*); I have also cut out from some of our old books the orders for the 23rd March 1852, and the Commissioners will see the various things entered in the order-book, and here I have the counterfoils, or the parts that we retain, showing that those orders were all sent.

1428. Your signature is the warrant to the tradesmen for the supply?—Yes; he will supply nothing without my signature; at the end of the quarter we write to the tradesmen for their bills, and then they send back my orders for every article sent in during the quarter, and an invoice is sent which is signed by the dispenser or matron, and that is security to me

that they have received them, and that they are of the right quality; the accounts are then sent in and checked by the clerk through these three different things, his own counterfoil, the invoice, and the order, he has three things to check them by; in 21 days he is bound to have his quarterly accounts ready to submit to the committee, he then sends his balance sheet in and his accounts to the committee, and the committee direct the secretary to call upon the committee of accounts to look into those accounts and report, the warrant is then signed for the treasurer, and then he pays the amount to the tradesmen in cheques, and that ends the whole affair.

1429. The treasurer will pay nothing without that general warrant?—No; he must get a warrant for every sum that he pays in a cheque, invariably, which is signed also by the secretary.

1430. There is a governor, a treasurer, and a secretary; and you have two clerks, one of whom acts as steward?—Yes; that is the whole staff.

1431. (*Sir Thomas Phillips.*) Is the treasurer your banker?—No; he is one of the governors; he has generally been chairman, and the next post he takes is treasurer. The drugs are ordered generally quarterly, as is shown by this page (*handing in the same*). There is a drug committee, and these are signed by the chairman on the other side. The orders are sent to me and I sign them.

1432. (*President.*) Where do you get your drugs? At various places.

1433. Who is responsible for the safe custody of the furniture when it is provided?—The nurse is answerable for all the furniture in her own ward, she has a very large store under her charge; she has probably 300 blankets, at least some of them have; they are all dated and numbered; the matron sees them once a quarter, and she is responsible.

1434. Is she responsible for the cleanliness of the ward?—Yes.

1435. Is she also responsible that the patients are kept clean?—Yes.

1436. What means have you for ablutions?—We have baths in all directions.

1437. Have you some that can be brought to the bedsides of the patients?—Yes; each ward has its own establishment of baths, and we have also lavatories.

1438. But for the bed-ridden patients how do you manage?—The baths can be brought to their bedside, or they can be wheeled in chairs to the baths.

1439. Have they basins and jugs, and things of that kind?—Abundance.

1440. How is the washing done?—In the laundry.

1441. Does it answer better than by contract?—Yes, it is cheaper.

1442. Have you tried both?—No, but I know what other hospitals do, and it is better done with us.

1443. Do you ever fumigate besides washing?—Not much. If any clothes are reported as being doubtful as to vermin, they are fumigated before they are sent to the laundry.

1444. But not as a precaution against infection?—No.

1445. (*Sir Thomas Phillips.*) What is the annual cost of the washing of 350 patients?—It is about 1*l.* a head, but the washing at the London hospital is different from other hospitals, inasmuch as we wash for all the establishment, all the resident officers, and a great proportion of the female servants. I think in the inner laundry there are 1,100 pieces washed weekly including gowns.

1446. (*President.*) Do you wash for the nurses?—No.

1447. (*Sir H. K. Storks.*) How many nurses have you?—Eight head nurses; nine indeed, for we have a supernumerary nurse.

1448. (*President.*) Who appoints the nurses?—The matron hires them subject to my approval, and then she reports to the committee that she has done so.

Robert John
Hill, Esq.

18 May 1857.

Robert John
Hill, Esq.

18 May 1857.

1449. How much do you pay them?—The head nurses get 37 guineas, and 35 guineas. The nurses in the men's wards get the largest amount.

1450. And rations?—Everything is found.

1451. (*Sir H. K. Storks.*) What do the under nurses receive?—Eighteen guineas.

1452. How many have you?—34 assistant nurses.

1453. (*Sir James Clark.*) How many nurses have you altogether?—We have nine head nurses, and 34 assistant nurses; we have, I think, 17 night nurses.

1454. (*President.*) What do you pay them?—Half a guinea a week, but they have no work to do, they live out; I am sorry to say there is no room for them to reside in the house; they merely come to sit in the ward; they have no scrubbing in the wards at night. We have in addition to these many extra nurses, and probably I pay on the average 4*l.* a week for extra attendants.

1455. (*Sir Thomas Phillips.*) Do you employ scrubbers?—No, they do their own work, the wards are all of that convenient size.

1456. (*Sir H. K. Storks.*) Have you any difficulty in getting the nurses?—None, whatever.

1457. Are they trained nurses?—No, we train them; I do not think we should have any difficulty in getting them.

1458. (*Mr. Martin.*) Where did you get the night nurses from?—They are very often married women, who have been assistant nurses.

1459. (*President.*) It would be more difficult to get the night nurses would it not?—No, I think not.

1460. (*Sir James Clark.*) Are the nurses well conducted generally?—Particularly so.

1461. (*Sir H. K. Storks.*) Do you require testimonials as to their character?—Yes, we are very strict on that score; the matron would not be satisfied with merely letters of recommendation.

1462. She is responsible for them?—Yes.

1463. (*President.*) She is responsible for the duties being properly performed?—Yes.

1464. If any one misbehaves, who has the power of dismissal in the case of an assistant-nurse or a head nurse?—In the case of a head nurse it is a very rare thing to occur, but the matron in that case would come to me and ask me what I should recommend to be done, and if it is a very serious case I should say, "Suspend her, and report the case to the committee "on Tuesday next."

1465. The medical officer would have nothing to do with that?—Nothing whatever; he may make his complaint, but he has nothing to do with the management of the hospital.

1466. With regard to the cooking, have you more than one kitchen?—Only one.

1467. In that is the whole cooking done?—Yes, not only for the wards but for the nurses, and there is a mess besides of eleven who dine at five o'clock—the officers' table.

1468. You can roast and boil, I presume?—Anything we like.

1469. How do you get your cooks?—The matron hires them.

1470. Do you give them high wages?—The cook receives twenty-four guineas a year and is boarded.

1471. Are they all responsible to the matron?—Yes. I am superintendent of everything, and all the different departments are answerable to me.

1472. Do you employ a woman cook?—Yes.

1473. In cases of the drainage or the ventilation being defective, or repairs being required, what is the process; who engages the labour to carry the improvement into effect?—If there is an important work to be done, I send to the surveyor and tell him to come and look at it.

1474. Is he a permanent officer?—He does not reside, but he is elected by the governors, and he is paid a per-centage upon the work done.

1475. You would send for him?—Yes, if it was an important thing.

1476. Supposing something were reported to you, you would send for the surveyor to examine it with you?—Yes.

1477. And supposing that he considers that such and such a course is necessary to be taken, what do you do?—Either he would write to the committee, naming about the probable amount required, or else I should do it myself.

1478. If they approved of it, who would carry it out?—He would. I have my own way of doing things, and I see that things are done as I wish them to be done, but he orders the bricklayers to go to work; I have my own views of matters, and have things done in my own way. Still he directs. Then again he adjusts all their accounts at the end of the quarter. The accounts of the artificers, the bricklayers, the carpenters, and the people whom we employ.

1479. You never do the work by contract?—Some things we do.

1480. Have you permanent artificers belonging to the hospital?—Yes, but we have other works besides. It is a very large establishment. We have no bricklayers, but there is a great deal of work done exclusive of our new works. We have every year a thousand pounds to pay for current repairs.

1481. Who keeps the accounts of the hospital?—The first clerk.

1482. The steward?—Yes. He keeps all the accounts of the tradesmen, but the secretary keeps the general account of the hospital bankers.

1483. I suppose the secretary does not interfere with the daily accounts of the hospital?—Not at all.

1484. He keeps minutes of the proceedings, and writes for subscriptions and so on?—Yes. He keeps all the bankers' books, the ledger, and all the general annual accounts he makes up himself.

1485. Who provides funds for the payments to be made?—We have our dividends and our rents.

1486. Do you pay once a quarter?—Yes.

1487. Who is it that signs the warrant for the payments?—The committee. That is to say, the chairman of the house committee signs the warrant which is given to the treasurer, and the treasurer then says to the secretary, "let the tradesmen come "on such and such a day," and then he signs the different cheques upon the banker.

1488. Will the banker honour the cheque without seeing the warrant?—The warrant is only the treasurer's authority for the amount which he draws, and he must produce his warrant at the end of the year when his accounts are made up. His cheques are produced, and he must produce the warrants.

1489. (*Sir Thomas Phillips.*) First of all you have a quarterly audit, have you not?—Yes.

1490. The tradesmen's bills for the quarter are submitted by you to the committee, having been audited, I suppose?—The committee of account audits them by direction of the house committee.

1491. Then a list of the bills being so audited is presented to the committee, and authority is given to the treasurer to draw?—A warrant.

1492. For that list?—Yes, or for any other; for instance, I want petty cash every fortnight, and no money can be got from the banker except the cheque is signed by the treasurer and by the secretary, and he cannot draw for money without a warrant, which is his voucher for drawing the cheques, and he keeps them till the end of the year and then he brings them forward as his authority for drawing so much money.

1493. (*President.*) What check have you upon the general expenditure of the hospital supposing that extravagant demands are made by the medical men?—We have none, we leave it to them.

1494. Practically, do they make extravagant demands?—We are disposed to think that they do rather.

1495. The whole scale of the living you think is higher than it need be?—The diet scale is not strictly adhered to, they may mix up other diets with it. They

may give a man full diet, and they may have in addition to that fish, or beef tea, and frequently they give two mutton chops, one for breakfast and one for dinner, and 20 ozs. of wine.

1496. Ought there not to be some means of checking that?—It is one of those difficult things that people who are not professional would not like to interfere with. We say sometimes that the consumption of wine has been large during the previous month, or of meat.

1497. Compared with other hospitals in London, you think that the diets required by the medical men are large?—Yes. At St. George's Hospital they give them 3 ozs. of cooked meat, and at Middlesex Hospital they give 4 ozs. while we give 8 ozs. full diet.

1498. Your rule is to give whatever is desired by the medical man; they are limited to the extras which they see on the list, but any amount of those things on that list they may give?—Yes.

1499. (*Mr. Martin.*) Do you apprehend that the patients who are admitted into your hospital are of a reduced class who require more diet than those who go into St. George's hospital?—No, I think it is just the other way, I am told that it is quite the other way. The men whom we get into our hospital are generally sailors and artificers, and men who consume a great deal of animal food, and they require more; they are better fed than the poor people who go into St. George's hospital; they are labouring men getting high wages and they live high.

1500. (*Sir Thomas Phillips.*) They are frequently men who are employed in the docks?—Yes; I have here a list of the patients that we have had in, and the Commissioners will see the enormous proportion of accidents that we receive; the proportion of surgical cases to medical is enormous.

1501. You have stated that sometimes you think the scale is extravagant for the diet and wine; I see that the average cost of each patient is not high; it is 8*d.* a day?—Yes.

1502. What is it that produces the great difference between 8*d.*, as the daily cost of the diet, and 2*s.* 3*d.*, which is the daily cost of each patient altogether?—There are the salaries and coals, and a general estimate of 1,000*l.* for current repairs annually.

1503. (*President.*) You have not included in that the interest of money sunk?—No, they are disbursements in the year.

1504. (*Sir Thomas Phillips.*) What is the average cost of each bed?—50*l.* is the cost of each bed at the present time.

1505. (*Sir James Clark.*) Do you ever pension your nurses after they become old?—Nothing of the kind. We generally give them a handsome gratuity.

1506. Is your hospital well ventilated?—Yes, excellently; we have nothing artificial; we trust to the windows, and we have very fine fire-places.

1507. (*Sir Thomas Phillips.*) Have you large passages and corridors?—Very fine corridors and fine lobbies between the wards where the patients dine; they do not dine in the wards, and in the lobbies there are fire-places.

1508. You have a large reservoir of air external to the wards themselves?—Yes.

1509. What space do your wards afford to each patient?—About 1700 feet.

1510. (*President.*) What is the distance between the beds?—8 feet.

1511. What is the height of your wards?—12 feet.

1512. (*Sir Thomas Phillips.*) Do you mean 1700 feet for each patient, exclusive of the space in the corridors and passages?—I mean exclusive of that large lobby, which is a very large space in addition, and is common to four other wards. Our wards are 72 feet by 20 and the height is 12, and we have ten patients in those wards.

1513. (*Dr. Sutherland.*) How many sick have you in each ward?—Ten.

1514. (*Sir Thomas Phillips.*) I suppose the diets are altered by the resident officers, day by day in the diet books?—Quite the contrary. They are not permitted to alter them except upon very rare occasions. The surgeons are very stern about that indeed, and the physicians particularly so; they study the diets very much. In many of the cases they give no medicine in the surgeons wards at all, and they effect a cure by diet, as far as I can make out.

1515. (*Sir James Clark.*) I suppose you have many applications for admission from patients whom you cannot receive?—Yes, we have.

1516. (*Sir H. K. Storks.*) Do you always take accidents in?—Yes, and all urgent cases.

1517. (*President.*) You have a greater proportion of accidents at your hospital than at any other hospital?—Very much so.

1518. (*Mr. Alexander.*) How many patients does one nurse attend to?—The head nurse has about forty patients, and the assistant nurses have ten. Each nurse has six assistants under her for forty patients; she has four by day and two by night.

1519. (*President.*) Would any neglect in any of the wards to report an offence to you constitute an offence in itself?—Undoubtedly.

1520. And it would be visited upon the person so neglecting?—Yes; there is a general system of responsibility. I oblige the nurses to report to the matron, and the matron reports to me; and so in the dispensary, the resident medical officer I hold responsible for his department, and if anything goes wrong and I find it out, I call him to account; they are all kept apart; the different departments of the hospital are entirely separate, and the heads of each department come to me.

1521. (*Mr. Martin.*) Does erysipelas arise frequently in patients within the house in the course of treatment?—Very little indeed. I do not say in no cases, but very few.

1522. (*President.*) Do you wash the wards in the hospital?—They are scrubbed once a week.

1523. Are they washed with water?—Yes, soap and water, and well scrubbed one day in the week.

1524. (*Sir H. K. Storks.*) Do you whitewash?—Every year the whole hospital, from the attics to the basement, is entirely scraped, and afterwards is coloured and whitewashed.

1525. And painted?—We paint, when necessary, the wood-work.

1526. (*Mr. Alexander.*) Who takes charge of the sanitary arrangements of the hospital, with regard to the ventilation, the cleansing, and the drainage?—We look to the resident medical officer; it is left more to him than anybody else; if there is anything faulty, (which there is not,) we look to him. The hospital is an old hospital, and has been standing for a hundred years.

1527. Supposing anything goes wrong in the drainage, how would you hear of it?—I should hear of it, and I should immediately employ the surveyor to see to it. The head engineer goes round every day to the water-closets to see that the taps are right; he looks into every water-closet to see that they are all sweet and pure. We have five water-closets to each four wards.

1528. (*Dr. Sutherland.*) You have got one ward fitted up with Parian cement, have you not?—Yes.

1529. How does it answer?—It failed in consequence of the colour, but the substance is admirable. The colour was so bad that we were obliged to have it coloured for appearance sake.

1530. What was the colour?—It became a deep brown colour, and the consequence was that we were obliged to colour it.

1531. If it had been properly coloured it would have been an admirable article?—Yes; we have one ward where the colour is good.

Robert John Hill, Esq.

18 May 1857.

The witness withdrew.

Adjourned to Wednesday next at One o'clock.

Wednesday, 20th May 1857.

PRESENT :

The Right Honourable SIDNEY HERBERT, M.P.
AUGUSTUS S. STAFFORD, Esq., M.P.
Col. Sir HENRY K. STORKS, K.C.B.
Dr. ANDREW SMITH.
THOMAS ALEXANDER, Esq., C.B.

SIR THOMAS PHILLIPS.
SIR JAMES CLARK, Bart.
JAMES R. MARTIN, Esq., F.R.S.
Dr. JOHN SUTHERLAND.

PRESIDENT, The Right Honourable SIDNEY HERBERT, M.P.

J. Meyer, Esq.

JOHN MEYER, Esquire, further examined.

20 May 1857.

1532. (*President.*) You promised to bring to the Commissioners some forms that were used in the Smyrna hospital?—Yes.

1533. What are they?—This (*producing the same*) is the bed-head ticket which was affixed to a small board and fastened up above the bed of every patient. These are the abstracts of extras (*handing in the same*). One return lasted for a week for each division.

1534. Have you the general diet table there?—Here are abstracts of the general diets (*handing in the same*).

1535. Is there anything that you wish to add to your former evidence?—I would merely mention one circumstance. With reference to the signing of those abstracts of the diets, I stated that they were invariably signed by the medical officer—we commenced in that way—it is upon the signing of those abstracts that the whole check of this plan hinges. They must be examined by somebody in whom confidence can be placed, or a door would be opened to all sorts of roguery and deception. First, the medical officers had to sign them daily, but it was found difficult to get the medical men to pay attention sufficient to secure the correctness of the abstract, and later it was placed, in each division, in the hands of some trustworthy person as one might have a person at one's command—sometimes a lady nurse, or occasionally a trustworthy ward-master—the latter were very well paid, and many of them were

exceedingly trustworthy men; here is the scale of diets that was adopted at Smyrna (*producing the same*).

1536. (*Dr. Sutherland.*) With regard to those diets you have had experience of dietaries in this country and in the colonies, have you not?—Not much in this country.

1537. Considering the variety in the quality of the supplies which you obtain, is it possible to draw up a diet list that will answer generally, or must you modify it?—I think that it was very necessary to modify it, and this was done at Smyrna very considerably; there were many extras that would not be used in a different climate and in a different place, and the quantities used would be different.

1538. (*Sir Thomas Phillips.*) Was not the ration of meat large for such a climate as Turkey?—The meat was so bad that you could not insure a dinner out of a smaller ration.

1539. (*President.*) Being lean, the proportion of bone was far greater?—Yes; the sheep did not weigh 20 lbs., and they were of very poor quality. The great object in framing the diets was to avoid the use of extras, and the men generally suffering from long disease, when they were convalescent and placed upon full or half diet, required a good deal of food.

1540. (*Sir Thomas Phillips.*) Is the meat weighed raw?—Yes.

The witness withdrew.

J. Scott
Robertson, Esq.

J. SCOTT ROBERTSON, Esq., examined.

1541. (*President.*) What rank do you hold?—That of purveyor-in-chief.

1542. You heard the evidence given by Mr. Pratt the other day, did you not?—A part of it I did.

1543. You have been purveyor-in-chief of a hospital abroad, have you not?—Yes, I was purveyor-in-chief at Scutari to the army in the East.

1544. Have you not been purveyor-in-chief of the hospitals at home?—I am now considered so.

1545. Where are you now?—At the War Office. I am not in a hospital, but at the head of the department. I was not in charge of any particular hospital in the East, but was placed over the department in the East; there was a separate purveyor for each hospital, and I was responsible for the management of the department generally.

1546. There is a considerable difference in the system abroad and at home, is there not?—Not so much in regard to the management of hospitals in the East.

1547. In this respect, Mr. Pratt stated that he was virtually a commissariat officer?—The purveyors in the East were likewise so.

1548. But only so far as the hospitals were concerned?—Mr. Pratt is, properly speaking, only purveyor so far as the hospitals are concerned.

1549. Does he not act as commissariat officer for the provisional battalion at Chatham?—In some respects, I believe, his duties differ from those of purveyors at home; but the differences are peculiar to Chatham. I do not think that they deserve to be considered as purveyor's duties.

1550. (*Sir H. K. Storks.*) He does not supply the troops at Chatham, does he?—I am not aware exactly. I think he supplies necessaries to the invalid dépôt. I believe he also supplies rations to the convalescents discharged from hospital.

1551. (*President.*) At Scutari you supplied the rations as well as all the hospital comforts?—Contracts were made by the commissariat for bread and meat, but the purveyor was responsible that the diets of the sick were properly provided.

1552.—How were they transferred to you?—We got them from the contractor direct.

1553. Without the intervention of the commissariat?—Yes.

1554. Had that been the system followed at Scutari?—Yes.

1555. You do not know what was the case before you went out?—I believe that was the system throughout.

1556. Do you think that the system of the purveyor drawing upon the barrack department for much of the

stores of the hospital is a good one?—Yes, I think it is a good one. I consider that the store branch or the barrack branch should be the source from which the hospital dry stores, furniture, bedding, and clothing should be derived; such stores are supplied under the direction of the store department in London. I think that inconvenience results not so much from the system, as from the want of a proper equipment for the hospitals which the barrack master should have at each station. Take Canada, for instance, the average number of troops stationed there is, of course, known, and from this the average sick may be easily estimated; the barrack-master then, or the storekeeper, should have an estimate from the purveyor or the principal medical officer as to the equipment required for the hospitals, and the reserve equipment for emergencies.

1557. Why do you say that he should have that estimate from the medical officer? Ought not the equipment of dry stores for the hospital to go, as a matter of course, according to the number of patients?—Certainly, but I do not think that the barrack-master can judge of the per-centage of sick or the necessities of the hospital so well as the medical officer.

1558. Instead of having a requisition made upon the purveyor for all the different things that are thought to be necessary upon each occasion, would not it simplify matters if you had a table in which should be included everything that was necessary for every patient in the hospital?—Yes; there are tables now in existence printed both in the barrack and hospital regulations; but many articles are from time to time required that are not included in these lists. It would be necessary to have an enlarged list, with a much more liberal equipment for each hospital.

1559. For each patient such and such things should be in store, should they not?—Yes; that is, with regard to hospitals generally; but my opinion with regard to a general hospital is, that the purveyor should have those articles in his possession.

1560. That he should have them in store in the hospital, whether in use or not?—Yes.

1561. So that if there were any delay in obtaining supplies from the barrack-master, the service of the hospital should never be impeded?—Yes; I acted upon that principle at Scutari, and I believe successfully.

1562. (*Sir H. K. Storks.*) But you had those things in your own charge, had you not?—Yes; we received them from England or purchased them at Constantinople when requisite; but I do not think that the convenience resulted so much from that as from taking the number of beds in each ward, and having the full equipment in the hospital, with a reserve in the purveyor's hands, in case of emergency.

1563. (*President.*) The barrack-master is a servant specially of the Ordnance branch in the War Department, is he not?—I think that the inspector-general of fortifications is now over the barrack department.

1564. His immediate business is the supervision of barracks rather than of purveyors and hospitals?—Barracks and hospitals.

1565. The inspector-general of fortifications is more intimately associated with the question of barracks than with the question of hospitals?—I should think that his duties included both.

1566. But you may have a hospital not connected with a barrack, may you not?—That depends upon circumstances; if troops were in quarters a house would require to be hired for a hospital.

1567. Have you found practically that there is any delay in answering the indents made upon the barrack-master?—I have had nothing to do personally with indenting upon the barrack department; there was no barrack department in the East.

1568. Under your instructions in Constantinople, you had the power, had you not, of purchasing in the market anything that was necessary for the hospital?—Yes, in the shape of utensils,

1569. Did you consider that that was a special power intrusted to you for the occasion, or would you now as the head of a general hospital be able to do the same thing?—I conceive that the purveyor at home has no right to purchase furniture; but a purveyor abroad, with the authority of the principal medical officer, and the General Officer, might be authorized to do so.

1570. Would he be distinctly told that he could not do so by his instructions?—There are at present no instructions generally applicable to purveyors.

1571. Under the new instructions would it be so?—There is an article there which would authorize it; but those instructions have been drawn out upon the principle authorized by the War Office, that the purveyor was to be in his position with regard to the medical department, what the commissariat now is to the army generally.

1572. Would that imply that the purveyor is bound to provide everything that the medical officer makes a requisition upon him for?—That the medical officer requires in his department; but I do not think that furniture would, properly speaking, belong to the purveyor's department.

1573. If the furniture was deficient or bad, would you consider that he had nothing to do with it?—I think the recourse is first to the barrack branch from the surgeon in the case of regimental hospitals.

1574. I refer to the general hospitals?—In the general hospitals abroad? I do not think there are any.

1575. Are there none at Malta or Gibraltar?—No, they are all regimental hospitals; but the principle abroad should be, I think, very much the same as at home, except that the purveyor should have more power in purchasing than at home, because reference is not so easily made to head quarters.

1576. The only existing instructions for purveyors are, the instructions that were issued in 1854 for the army in the East?—Yes, but they are of no use to the purveyors of districts; they are not applicable to purveyors for their general duty, they are applicable only to general hospital purposes; and I consider that they rather led to a misunderstanding in the East, than otherwise.

1577. With respect to barrack furniture, you think you ought to have a store yourself?—The purveyor of a general hospital should have a store.

1578. You think the purveyor of a general hospital ought always to have all stores within the building that were required?—Everything for the equipment of the hospital; if it contain 1000 beds, he should have the full equipment for 1000, and a reserve in store to meet any emergency, or to replace any articles damaged or lost.

1579. Do you think that the supplies which are now given by the barrack department are sufficient?—No, I think not.

1580. You would require an enlargement of the list?—I think that probably the director-general, or the officers who are best qualified to decide what is proper for a hospital, should make out a list, and the barrack department should be required to furnish accordingly.

1581. If you ask for anything at present which the barrack department has not got, you simply do not get it?—They would not give it at present, but there are several things now as to which some of the purveyors apply direct to the War Office for authority to purchase, others apply to the barrack department on the station. I think that those who apply direct to the War Office get their answers much sooner than the others; the authority goes from here, probably, to the purveyor to purchase.

1582. What is the reason of that difference?—I presume it is that the barrack-master has no stores in hand, and probably he does not consider that he is called upon to supply them.

1583. (*Sir H. K. Storks.*) It is virtually the same application, except that the one through the barrack department is more round-about?—Yes.

*J. Scott
Robertson, Esq.
20 May 1857.*

J. Scott
Robertson, Esq.
20 May 1857.

1584. (*President.*) If the barrack-master finds that the medical officer who makes his request is satisfied with his stating that he has no such thing in store, he would probably not trouble himself to represent the deficiency?—I do not think he would.

1585. You have two systems actually in use for the purpose of obtaining the same supplies?—Quite so, but of course the quickest means the purveyor has of getting stores is to apply for authority to buy them. Since I have been home I have had several applications of that sort before me.

1586. Did you allow them?—The War Office authorized the purveyor to purchase them.

1587. In your discretion you think it is better that they should be allowed to do so, rather than that the barrack department should be applied to to purchase and issue them?—It does not matter which. If the barrack department supplied them, well and good; but there is at present so much reference from one department to another that it is much better that the purveyor should get them.

1588. It would be the easiest in practice?—It does not follow that it would be the easiest in practice if the barrack department were authorized to supply those things upon application.

1589. Are they not authorized to supply them now?—I do not think so; they have a certain list beyond which they cannot go.

1590. Is it not somebody's business to authorize the barrack department to issue those things?—It is the business of the Secretary-of-State.

1591. Therefore the deficiency of the barrack department ought to be brought to his notice?—Quite so.

1592. Where anything is required in a hurry, however well intentioned the barrack department may be, does not application to another department for small articles produce much unnecessary delay?—Certainly. It would be the more expeditious way of getting the wants of the hospital supplied, if the purveyor of a general hospital were authorized upon the approval of the principal medical officer, or whoever is the head, to buy those things on the spot without reference.

1593. If you had a table of everything that should be supplied, and you had them in store, and once a quarter you took stock to see how much you had in store over what you had in use, and you made up that which by the regulation was to be the standing store, you would have very little trouble with the medical officer, and you would require but few requisitions?—A very few indeed.

1594. You have no reserve within the hospital?—I think in but few cases have they a reserve at present.

1595. In the East you say that you procured things yourself, without reference to the barrack department?—Yes, the barrack department rather depended upon us for things in the East.

1596. At Constantinople there was no representative of the barrack department?—Not properly speaking so. There was a store-keeper. An army in the field does not have a barrack-master.

1597. If you pursue the practice in peace of getting everything through the barrack-master, it is always necessary to change it in war, is it not?—That does not follow.

1598. The barrack-master is not there?—Just so; but an officer of the store branch would be there, as is now the case in China; they have taken the equipment for the hospitals out there.

1599. But at Constantinople you did not take that course?—No, there was no previous organization.

1600. With a general store-keeper out there, I suppose the tendency of the way of performing their duty was to send everything by preference to the front, where it would be most required?—There was a store-keeper at Constantinople, but I think it was entirely army-stores for effective service that he had charge of. He had nothing to do with the hospitals. I do not know exactly what description of stores the store branch had at Constantinople. I know that he had nothing for us, except in one or two

instances he bought, or, I think, the engineer got some bedsteads made for us.

1601. If the purveying of the hospital, not only of the rations but of the medical comforts, and so on, had been put upon the commissariat, could they have done it as effectually as the purveyor?—No, I think not.

1602. Will you state why?—Simply because the subdivision of labour always, I think, ensures the work being done more correctly. I should expect a shoemaker to make my boots much better than a tailor; and I expect the purveyor, whose duties are to attend to a hospital, to do the work of the hospital much better than a commissariat officer who has the effective army to provide for, and who, even if he had the work of the hospital to do, would consider it a subsidiary duty.

1603. Is not an arrangement which is good as between the purveyor and the commissariat good as between the purveyor and the barrack-master?—Exactly so.

1604. The best security to have a hospital efficient is, that the purveyor in the hospital should be the source of supply?—Yes; to the medical officers; but when the commissariat have existing general contracts for the supply of bread and meat, the purveyor should be able to avail himself of them; and when the War Department storekeeper has stores in his possession for the different branches of the service, the purveyor should apply to him for the articles he requires for hospital use.

1605. To draw upon?—Yes; the purveyor should send him an estimate of the stores that he may require for the year, just as he sends to the commissariat an estimate for money.

1606. There are certain stores necessary for a hospital, are there not, which the store-keeper could not have?—I think he should depend upon the purveyor, or the principal medical officer of the hospital, to give him the necessary information, and he should then provide accordingly.

1607. All the medical comforts could be provided by nobody but the purveyor?—The provision of these is distinctly the purveyor's duty.

1608. You think that they could not be transferred to any other body?—Not with convenience. I think it is quite possible to do away with all the departments by bringing them into one, and making the commissariat everything, but I do not think it would work well.

1609. You think that the commissariat would have its attention too much fixed upon the efficiency of the army in the front to think of the hospitals in the rear?—I think it was frequently found so in the case of the hospitals in the East, where purveyors depended on the commissariat for bread and other articles.

1610. You see no difficulty in the purveyor, whether he originally gets his stores from the barrack-master or not, issuing for every patient certain things without a requisition from the medical officer?—Each bed in a hospital should be fully equipped; so many sheets, so many blankets, and changes, of course, of everything, as part of the equipment.

1611. And the admission-book of the hospital would be a voucher to the purveyor for the number of beds and other things issued?—Yes, exactly so. Suppose a hospital with 1,000 beds, of course there should be to each a bedstead, a mattress or paillasse, bolster, pillow, blankets, sheets, and coverlid.

1612. You would include other things, would you not?—Yes, all necessary utensils, plates, knives and forks, &c., those would all be in the ward under the ward-master's charge, of course; then there is the personal equipment, there would be the necessary changes of clothing for the patient; probably three sets, one in use, one being washed, and the other in the charge of the ward-master for the next change of linen. The purveyor would receive the dirty linen on the day it was changed, and would send it to be washed, and when it came back he would

*J. Scott
Robertson, Esq.*

20 May 1857.

receive it into store; the ward-master in the meantime would, of course, having sent so much dirty linen, receive from the purveyor's issuing store, so much clean linen, and the ward by that means would be continually in a state of equipment for the full number of patients.

1613. Is the present equipment sufficient?—It is difficult to answer that question because of the present unsettled state of matters connected with hospitals generally. In regimental as well as general hospitals the soldier supplies the most of the things he requires; but I believe the Secretary of State has decided that the patients are to be allowed in future certain articles of clothing for use while in hospital; therefore their packs and their clothing will go to the pack store.

1614. Are you at all acquainted with the interior of the Chatham hospital?—No, I have never been there. I am not much acquainted with the interior of any of the hospitals at home. Since I have been at home I have been principally performing my duties at the War Office. The practice is so varied just now in different districts, that to give an answer to any particular question one would have to know the district to which it refers.

1615. You are in a transition state?—I do not think that it has ever been different. I think that the system all along has been most unsatisfactory.

1616. Still at present you have regulations put out for the future which did not exist before; for instance, such a one as you have mentioned that the soldier's kit is not to be drawn upon?—Yes, when that is promulgated it will extend to the general hospitals both at home and abroad. I do not know whether it extends to the regimental hospitals.

1617. Ought every general hospital to have a laundry attached to it, or would you wash by contract?—At Chatham and Dublin the system of having a laundry has answered very well, and in an economical point of view, so far as the washing of the personal linen is concerned, it has been very successful.

1618. (*Sir H. K. Storks.*) How did you wash at Scutari?—We began originally by contracts; then a great proportion was washed at a public wash-house erected by the engineers in the valley between the general and barrack hospitals.

1619. Did you perform any washing at Scutari besides the washing for the hospitals there?—When the men brought down their blankets, we washed them.

1620. Did you wash for the hospitals in the front?—Yes. When I visited the Crimea, I found that the washing was so badly done there, that I requested that the dirty linen should be sent down to Scutari every week.

1621. How did you wash it?—Partly by contract; what could not be done at the wash-house, we gave out to a contractor.

1622. Was it as well done by contract?—I think it was done very well. The things were in such a dreadfully filthy state, that I think any system would have failed to wash them clean.

1623. (*President.*) Upon the whole, you think that you should still receive your stores from the barrack-master, but retaining such a reserve in store as should give you security against any deficiency?—With regard to general hospitals, and under the circumstances I have already stated, I do not think that we should have to go to the barrack-master more than once a year. At the end of the year the purveyor would find out how much had been expended, and what his reserve store would be equal to supply, and he would merely have to send in an estimate to the barrack-master for the additional articles required.

1624. Would you have the same confidence in the goodness of the materials to be supplied by the barrack-master, as you would have if you were in the hospital and you were the person to judge of the quality of the articles, and made the contracts?—I have not the least doubt that the purveyor and the medical officer are the best judges of what is needed for a hospital, and upon that principle I should say that

they would know the description of bedstead, and the quality of the bedding and linen, as well as the quality of the food that was best suited to the patient.

1625. You would have more authority in the rejection of what was thought unfit than if you merely had to pass your rejection on to another department, who naturally would justify their purchase?—Yes.

1626. There would be greater security, would there not, for the excellence of the supply, if you furnished it yourself?—Yes, just the same as if I bought articles for my own private consumption instead of intrusting the purchase to another person who had less interest in the matter.

1627. Take the question of repairs and alterations at Scutari; how did you do that?—The system varied a little at Scutari. At the general hospital the principal medical officer made a demand on the purveyor, who forwarded a requisition to the commanding engineer. The course at the barrack hospital was for me to send a requisition to the Quartermaster-General, who approved of it or not, and if approved it went to the engineer to be executed.

1628. (*Sir H. K. Storks.*) Who approved of them?—Captain Macdonald.

1629. Did he approve upon his own responsibility?—Always; except in large alterations.

1630. Say for a pane of glass?—I do not think the engineers would necessarily require an approval to such small repairs; but when I went to Scutari, for instance, the latrines had no coverings, and I made a requisition for seats; those were put in by Captain Gordon, I presume only with the approval of the Quartermaster-General. I do not think that Lord William Paulet ever saw the requisition; but in the case of a large expenditure, I believe the Quartermaster-General or engineer would lay it before the General Officer commanding, for his approval.

1631. (*President.*) You have had no experience of hospitals at home in that respect?—The system at home is, I believe, for the purveyor to make a requisition upon the barrack-master and the barrack-master forwards it to the engineer, who then executes the repairs.

1632. Does the barrack department invariably execute them?—That is a question I cannot answer. That is the system; the purveyor has nothing to do with the engineer; he sends his requisition to the barrack-master, who sends it to the engineer.

1633. You do not know practically whether the engineer employs an engineer to do it, or whether he does it by hired labour?—Possibly by both systems, according to the wants of the station. At Scutari the engineer employed his own men; but he also engaged labour, and did the work partly by contract.

1634. In the case of insufficiency of ventilation, who is the judge as to the number of patients that there ought to be in a ward in the hospital?—Decidedly the principal medical officer is the most competent judge.

1635. It is laid down in the regulations that there shall be so much space for every man, and a certain distance between the beds?—It is so stated in the hospital regulations of 1845.

1636. If the medical officer complained that there were more beds than the ward would hold consistently with the regulation, what would the purveyor do; would he have any remedy?—On the order of the principal medical officer he could alter it.

1637. If the wards are full, and the fulness of the wards militates against that regulation as to the number of men to be in each ward, and the principal medical officer complains to the purveyor, to whom has the purveyor recourse?—He could have recourse to the engineer, but I do not think that the purveyor in that case would be referred to; it would be a case for the principal medical officer to report. We have had a case of that sort recently, I think. When a purveyor was sent over to Jersey, he made a representation that the hospitals there were in an unfit state for the sick, but he could do nothing on the spot, and therefore he referred the question to the War Office.

*J. Scott
Robertson, Esq.*

20 May 1857.

1638. Were they unfit from being too small or otherwise?—I do not remember the particular circumstances of the case; at any rate they were unfit from their position. I think from dampness.

1639. If they were large enough, but unfit from the want of ventilation, could the purveyor open a ventilator?—No, unquestionably not; he cannot make any alterations in the building.

1640. He could apply to the barrack-master, could he not, and ask him to do it?—By the direction of the principal medical officer he might do so.

1641. Did the barrack-master exercise any discretion in that matter? did he execute it or refuse, or say "I do not think it is necessary?"—I should think that they would, in cases of difficulty, refer to the officer commanding, and would not take upon themselves to refuse. The commanding engineer has a certain amount of money at his disposal, and he might say "I have no money to do so;" if it was a matter of very great importance, he might refer it home to head quarters, if he was urged to do what was required.

1642. Do you happen to know whether, in the estimates, sums are voted separately for barracks and hospitals?—I think that a certain sum is voted for each station.

1643. But for barracks as separate from hospitals?—I cannot answer that question.

1644. Applying the same test that you do to the case of food and the supply of dry stores, would not the hospital service be far more efficient, if there was some limited authority vested in some one on the spot to make alterations when a necessity occurs?—Decidedly. I conceive that the principal medical officer on each station, who is a man of experience generally and of high relative rank, should be invested with the power, in cases that he saw necessary, to request the proper officer to make such alterations as were required for the interests of the sick.

1645. With regard to the ventilation of the building and to the correction of insufficient drainage, ought there not to be somebody on the spot to order such things to be done?—In a case of that kind, involving a large expenditure of money, I think, on the representation of the principal medical officer, the general officer commanding should be invested with power to make alterations.

1646. You would not have some person within the hospital, in the nature of a commandant, who should have that power?—That applies to the general hospitals, does it not?

1647. Yes.—I think, as to general hospitals, there should be a directing power, and that power should be vested in a military officer as commandant, and that he, together with the principal medical officer or physician, and the purveyor, at a board, should decide what was to be done in the hospital, and that power should be vested in them to carry out their decision.

1648. Having three departments co-operating in the hospital, the medical department, the purveyor, and for building, the engineering department?—An engineer officer might be attached to the building, under the direction of the commandant.

1649. Instead of those three departments always referring up to the central authority at Whitehall, there should be some one person able to bring those three bodies into co-operation, upon his own responsibility; and when he felt the task too heavy for himself alone, he should be able to refer to the Secretary of State?—I think the want of such a directing power is the great evil of the present system.

1650. Would not that simplify the thing very much?—Very much. I think it would work admirably well; that was the old system, I think.

1651. Why was that system abandoned?—I suppose it was from principles of economy.

1652. (*Sir Thomas Phillips.*) What book are you referring to?—I have the general hospital regulations of February 1820.

1653. (*President.*) Will you read that rule?—"The Commandant is invested with the entire control of the

hospital." It does not invest him with the power of altering the hospital; but I should think that in such a case he would be the proper person to authorize expenditure for alterations, and that with his concurrence, on the recommendation of the board in the hospital, the alteration should be made.

1654. (*Sir Thomas Phillips.*) That rule refers to the Commandant-General of hospitals, does it not?—Yes; and the commandants under him.

1655. Is there any such officer now as the Commandant-General of hospitals?—There is no such officer.

1656. (*President.*) Do you consider that there ought to be a separate transport for the medical department?—My opinion is this, that with regard to an army in the field, there should be a Commandant-General of hospitals with the army in the field in operations, and that he, with the purveyors and others under him, should have everything for the sick.

1657. (*Sir H. K. Storks.*) Transports and all?—Yes, everything. That there should be a purveyor's clerk attached to each regiment, having charge of the stores, who would also prepare the hospital returns, financial or otherwise, and who should, after an action, have, under the commandant, the duty of removing the wounded.

1658. (*President.*) From the necessity of the service they must have distinct means of carriage?—The necessities of the service require distinct means of carriage in the removal of the sick.

1659. Therefore, the question is, whether or not they should apply to the Land Transport for horses, or have horses of their own?—There would be ample work, of course, for horses of their own in carrying hospital stores, and therefore it would be no matter of extra expenditure, I should think, for the hospital branch to have everything within itself; but there would be no difficulty in transferring to the Commandant-General a portion of the military train for the purpose.

1660. It would not, you think, produce complication?—No, I think that they have that arrangement in the French service; but there should be a superior military officer, equal in rank to the Quartermaster-General, who should have the whole management of those things.

1661. In the French service the Intendance supplies the army as well as the hospital, and everything to all the departments, does he not?—I do not know that he does; I understood that he was over the hospitals only.

1662. In the report of Mr. Cumming upon the state of the medical department in the Crimea, he mentions this:—"We learnt that the issue to regiments of huts and marquees and other articles was made only upon requisition. We think that the consequence of this practice may be observed in the hospital accommodation which the above table exhibits. The condition of the sick varies in every regiment, and it varies in great measure with the energy and zeal of the commanding and medical officers, and with the means of transport at their disposal." And the third suggestion that he makes is, "That every regiment should always be supplied at once with its due allowance of hospital accommodation and furniture without requisition?"—Yes, quite so; they should follow the division. The probable number of sick and wounded should be calculated, and then the equipment for that number should follow with the rest of the baggage.

1663. The fourth suggestion is, "That a store of medicines and medical comforts, sufficient for the probable wants of the army for three months, should always be kept at head quarters, or some other place easily accessible to the various divisions of the army." All those details you probably agree with?—Yes, quite so. That is the principle upon which I provided the stores in the East, and upon which we are acting with regard to the Chinese expedition.

1664. "That these stores should be replenished periodically from the principal store without requisi-

tion." That is, in fixed quantities from the principal store at the base of operations?—The proper course in such a case would be to supply on requisition; I think the system at Scutari will perhaps very much illustrate it. The general store was apart altogether from the separate hospital stores. When I arrived at Scutari the surplus stores were mixed up with the individual hospital stores; I separated them altogether from the hospital stores, and equipped each hospital with medical comforts equal to three months' consumption, after which I had the reserve placed in the general store; I refer to the hospitals in the Bosphorus only. From the general store were supplied, upon the requisition of the purveyors, such quantities of dry stores and other things as they required. We supplied the hospitals in the Crimea as well, upon the requisition of the senior purveyor there. He kept a subsidiary store for the use of the hospitals in the Crimea and the regimental hospitals in the front. His demands upon the general store at Scutari were very large, so much so that at first when I went out his requisitions could not be complied with in full until I went into the market at Constantinople to purchase.

1665. (*Sir Thomas Phillips*.) Did you send those supplies off upon requisition only?—Yes.

1666. Is there any inconvenience in requiring a requisition to be made to you?—No inconvenience at all. We cannot, unless we have returns, know the actual expenditure of the hospital; and I consider that the purveyor in charge of the hospital is the best judge, as he would, from his accounts, know the state of his store and the rate of consumption, and accordingly would frame his requisition upon the principal dépôt.

1667. (*President*.) If the ration of the soldier was enlarged, and consisted of other things besides a pound of meat and a pound of bread, would not that diminish the number of extras, and so diminish the number of requisitions?—The number of requisitions need not be very large in a hospital in ordinary circumstances; the extras are all placed on the diet rolls, or should be so; of course when a medical officer visits his patients in the course of the day, after the extra diet roll has been made up, he may think it necessary to make a requisition on the purveyor's stores for extras required on the instant; but this is not a source of inconvenience.

1668. You would have in your store everything included in the list of extras?—Yes.

1669. And wine?—Yes, clearly so, everything of that description; for these the purveyor should only require requisitions. In the first instance I believe in the East they had no diet rolls or requisitions; the number of sick was so great, and the staff so inadequate, that they supplied the list without reference to requisition or any other voucher; such was the case at the general hospitals at Kulali and Scutari.

1670. How was that done? There must have been some record to help the man's memory?—All the men that came down were placed on half-diet. The purveyor issued the half-diet, and a quantity of extras which were divided among the wards to meet the necessities of the sick.

1671. Mr. Wreford states that when he first arrived there, "porter, ale, and occasionally barley, sugar, and rice, are procured for the hospital from the commissariat, who also supplies straw, wood, and charcoal, and, according to Mr. Stuart's evidence, candles and oil." "When the hospital was first established the purveyor made the contract; afterwards, the commissary-general claimed the right of making the contract, but appended the condition that the purveyor was to pay. This was done about July or August. Things continued under that arrangement till 1st January. Since that time we have reverted to the usage that the commissary pays the contractor on the verified account of the purveyor." Is that the course that you pursued?—Yes; the contractor supplied us with the provisions, and the commissariat rendered to us, quarterly or monthly, an abstract of the supplies furnished by the contractor. The purveyor then pre-

pared a draft on the commissariat chest in favour of the commissariat officer, who paid himself, and gave the purveyor a receipt for the amount; there was no money transaction.

1672. Mr. Cumming and Mr. Maxwell state, "We think that the duties of the purveyor in our hospitals in the East are too numerous and heterogeneous to be efficiently performed by one person." Do you agree with that?—Probably so; but not with a sufficient staff under him.

1673. Mr. Cumming does not mean one man, but one class of officers?—Then I do not agree with him.

1674. They further say, "he has to provide clothing, stationery, provisions, and washing; and to issue the former and superintend the last. He has, further, to superintend the servants, and the cooking and distribution of meals; to see to the cleanliness of the passages and exterior of the building; to report its want of repair; to make funeral arrangements; to keep a register of the patients, officers, and servants; to make out the pay and ration returns of officers, their servants, and horses; and to make the wills of any patients needing that assistance." Practically, can the purveyor be made responsible for the cleanliness of the wards, and the proper usage of the furniture and stores that are in them?—I do not think he can.

1675. There is no officer permanently in the ward, is there?—The ward-master is there; but it is impossible for the purveyor to exercise proper control over him, unless the ward-master is his servant.

1676. Is not the ward-master the proper person to be held responsible?—Under the surgeon.

1677. And you think that some chief attendant in each ward should be responsible for the care of the furniture, and for the cleanliness of the ward, and the cleanliness of the patients?—Most certainly.

1678. He ought to be under one chief?—Under the senior medical officer of the division of the hospital. I think it would be found to work very badly, to place the purveyor over the ward-master, or the orderlies within the ward, under the present system.

1679. His responsibility should end, so far as the care of the stores is concerned, when he has issued them?—I think so; but that he should make his inspections with the barrack-master, weekly or monthly.

1680. You now send back to the barrack-master the barrack bedding to be washed?—At present the bedding is washed by him.

1681. Is it well done, or are there complaints of it?—I hear no complaints of it. At Woolwich the system works very well, but the contractor for the hospital personal linen and the contractor for the bedding is one and the same person, and they are both done well. I see no reason why it should not work well; the purveyor would have his necessary equipment, and he would be independent of occasional delays, if such occurred.

1682. Would it not be better if all the washing was done within the laundry of the hospital?—Where there is a laundry it might be so, and it would simplify the matter.

1683. Would it not also obviate the complaints that are sometimes made, that the washing is insufficiently done?—I did not know that such complaints existed.

1684. The same principle will apply again there, that those who are interested in having things done, are most likely to have them properly done?—The purveyors are the responsible officers, therefore all the blame would be attachable to them, and they, being under the control of the supreme authority in the hospital, there would be greater power over them than there could be over the barrack-master.

1685. When you were at Scutari, had you the medical staff corps?—Yes, we had the medical staff corps latterly.

1686. Were they then in full operation?—Yes.

1687. Members of the medical staff corps, acting as ward-masters?—Yes.

1688. They were persons, were they not, in whom you could place confidence for the responsibility of the wards?—Some of them were very good men, I believe.

*J. Scott
Robertson, Esq.*

20 May 1857.

1689. You occasionally sent round one of your own clerks, did you not?—I took that step at first, in order to satisfy myself, not with regard to the medical staff corps, for they had not arrived, but with regard to the cleanliness of the wards generally. I believe one medical officer objected to it, but Mr. Cumming supported me in it, as he generally did.

1690. It was found that he had not the same authority in the ward as the man whose authority was recognized there day and night?—He could not have.

1691. Nor could he know what was constantly occurring?—No.

1692. The ward master would have more authority than even your clerk going round?—Clearly so; the ward-master I consider to be the responsible person under the surgeon for the cleanliness and proper conduct of the ward.

1693. (*Sir H. K. Storks.*) Was the purveyor at Scutari responsible for the cleanliness of the interior of the hospital?—Not for the interior; he was for the passages and the privies.

1694. The exterior?—Yes.

1695. Was the question raised as to who was responsible for the interior, and who was responsible for the exterior?—I think it was so with one of the purveyors.

1696. How was that decided?—It was decided that the purveyor had only to do with the exterior, the passages and the open places, and that he was not responsible for the cleanliness of the interior of the wards.

1697. And that he was not responsible for the conduct of the kitchen?—Yes. For the kitchen he was responsible.

1698. By whom was that order issued?—I think by the general officer in command.

1699. (*Sir Thomas Phillips.*) Are you aware that in a civil hospital that is not so?—I believe that the medical officer simply performs his professional duties in a civil hospital.

1700. How do you think that system would apply to a military hospital?—If the medical officer were only held responsible for his professional duties, I do not see why it should not answer very well. You would simply require to have a resident officer, to be supreme over the servants.

1701. That would be making the ward-master the servant of the purveyor instead of the servant of the medical officer?—Yes, it would be extending the duties of the purveyor and making him supreme over the servants. He has, by the old regulations, the general supervision of the servants, but I think that is in practice obsolete. I do not think he can exercise any supervision where they are under the charge of the surgeon.

1702. With regard to the supply at present in a general hospital,—supposing I were to divide the actual supplies into four classes, and to call one fixed stores or equipments, the other rations, the third medical comforts, and the fourth medicine; the fixed stores are supplied from the barrack department, are they not?—Yes.

1703. At least, certain portions of them; that is to say, those articles which are kept in store in the barrack department?—Yes, those the barrack-master supplies.

1704. Whatever is needed of that class of necessities which is not in the barrack-master's list, is the purveyor himself then authorized to supply by purchase or otherwise?—He applies to the War Office for authority to purchase.

1705. Without that authority he has no power to supply articles which may be needed, but which are not in the barrack-master's list?—At home he has no authority. Abroad I should think that the authority would be in the principal medical officer or general officer commanding; there is no regulation to that effect.

1706. (*President.*) Is not this the fact, that for the supply of round towels you apply to the barrack

department; but as the barrack department does not supply square towels for the men who are confined to bed, you have to make an application to the Secretary of State to be permitted to purchase square towels?—It would be so in that case.

1707. (*Sir Thomas Phillips.*) Then there is no express authority, so far as you know, to any officer to provide those articles without application to the War Office?—No.

1708. Now take the question of rations; are they supplied direct by the purveyor; does he contract for them, or is that contract made by the commissariat and supplied through the commissariat to the purveyor?—The purveyor provides the medical comforts, that is, wine and such articles; but for meat and bread the purveyor takes advantage of the commissariat contracts, where they exist.

1709. That is to say he derives all his supplies through the contracts that the commissariat enter into for victualling?—Yes; he has power to make contracts for himself, but in practice he generally takes the commissariat contract.

1710. Is he absolutely authorized to make any contracts that he pleases for victualling the hospital?—Yes.

1711. (*Sir H. K. Storks.*) How do you show that?—By the present practice and the written instructions with which he is invested.

1712. Can you show the Commissioners those instructions?—I have not got a copy of them; but much of the same spirit is in the proposed instructions now in your possession; and instructions have been issued provisionally which have been sent to foreign stations.

1713. (*Sir Thomas Phillips.*) Apart from this do you know any instances in which a purveyor has victualled an hospital independently of the commissariat contracts?—In the case of Chatham it is so, and I think it was the practice in Dublin: I believe the purveyor there now takes advantage of the commissariat contracts.

1714. Are you of opinion that the purveyor ought to have full authority to victual the hospital independently of the commissariat?—I think he should have power to act according to his own discretion in the matter.

1715. Then we come to the medical comforts; by what authority are they supplied?—That is considered to be the province of the purveyor, and he supplies them without reference to the commissariat; bread and meat are the only articles regarding which a distinction may be made.

1716. What is the distinction that you draw?—That he uses if he pleases the commissariat contract for supplies of bread and meat to the troops; but for all other supplies he arranges himself with the tradesmen direct.

1717. That is only as a matter of convenience to himself. As I understand you, he has absolute authority to victual the hospital at his own discretion?—Yes.

1718. And it is only in exercising that discretion that he goes to the commissariat?—Yes.

1719. He has absolute power to victual and to supply medical comforts to the hospital to any extent, has he not?—Yes.

1720. Upon his own individual responsibility?—Yes; his acquittance being the proof of the authorized consumption in the hospital of the things purchased.

1721. (*President.*) The nature of the things depending upon the opinion of the medical officer?—Yes.

1722. And that you would obey always?—Yes.

1723. Would you obey it if it was an extravagant demand?—Yes, provided the demand were in the handwriting of the surgeon. There was an instance in Dublin in which a man was, I think, provided with an average of 12 bottles of porter a-day, and other extras in proportion; the purveyor, very properly, I think, brought the circumstance under the

*J. Scott
Robertson, Esq.*

20 May 1857.

notice of the principal medical officer personally; but the principal medical officer considered it a delicate question, and would not interfere. I suppose the disease with which the man was afflicted justified the expenditure of so many comforts; however, that was an extraordinary case, and it only instances the point where the purveyor might very properly call the principal medical officer's attention to a particular diet-roll.

1724. (*Sir Thomas Phillips.*) With regard to the equipment and the standing provision for the supply of the hospital, are the Commissioners to understand you to say that you think it would be more convenient that they should be supplied independently by the purveyor's department, or that it could be conveniently supplied from the barrack department, as has hitherto been done?—The advantage of the barrack department equipping the hospital is this, that they, I presume, have larger contracts for certain articles, and they furnish the things cheaper under those contracts; that is the only advantage that I know of.

1725. You stated, did you not, in answer to a question which was put to you by the Right Honourable President, that if the contracts were made by the purveyor's department independently of the barrack department you thought that you would have better means of satisfying yourself as to the quality and description of the article supplied?—Clearly.

1726. And thereby ensuring a better description of articles?—Yes; but not on such an economical scale.

1727. Economy, you think, would be consulted by means of the barrack department?—By their larger contracts.

1728. And quality might also be ensured?—I do not see why not. If the barrack department were impressed with the necessity of procuring a superior thing for the hospital, they certainly could provide it.

1729. Supposing that the purveyor of a hospital in Great Britain, instead of communicating as at present through the barrack department, communicated through the purveyor's department in London, would that in your judgment facilitate the supply of any article that he might need?—I think that it would facilitate it very much if the estimates were forwarded to the branch here, when I could express an opinion upon them and then forward them to the store branch to supply the necessary articles.

1730. (*Mr. Martin.*) Is it not the practice of the service that the commissary contracts, and that you receive and dispense?—The service abroad has been so; it was so in the East.

1731. (*Sir H. K. Storks.*) Is it not within your knowledge that all contracts are to be made by the commissariat, particularly for bread and meat?—It is stated so in the hospital regulations of 1845, but the provisional instructions with which the purveyors are furnished, give them, as far as I recollect, the option of making contracts for hospital supplies. Though the power is vested in the purveyor, I do not think that it has ever been exercised.

1732. Will you show the Commissioners how that power is vested in the purveyor by the existing regulations, which authorizes him to enter into contracts?—I will.

1733. (*Dr. Andrew Smith.*) Is it the practice now for the purveyor to be required to take the meat and bread for the hospital, such as the troops have to receive, or is not the purveyor allowed to give an extra payment for better meat and bread?—I think that refers to home. I do not think, with regard to the purveyor, that that is placed in the hospital regulations; nor do I believe that abroad it is the practice for the purveyor to do so. In the East we used the bread and meat that we got from the commissariat. At home the purveyor is allowed to pay a halfpenny a pound extra for meat beyond the contract price for the troops, to ensure better quality for the sick.

1734. For instance, at the Cape of Good Hope, or any other station, there is a purveyor, and that purveyor would not be required to receive the meat and bread usually issued to the soldiers, agreeably to contract, but there would be the privilege granted to him of paying a higher amount in consequence of the bread and meat being required to be of a superior quality?—Yes; I presume he would have that discretionary power.

1735. (*Mr. Martin.*) Is there any preparatory training for young men for your branch of the service?—They enter the purveyor's office and are trained there. The purveyor's department is one that has been resuscitated in a measure, but it has been in abeyance for many years.

1736. Its existence is not permanent but occasional?—During the war in the peninsula it formed a part of the army establishment, but since then it has been until very lately in a great measure discontinued.

1737. Are not their functions in abeyance during peace?—To a certain extent they have been discontinued.

1738. What are the distinctions which you consider proper as separating the duties of the purveyor and those of the commissariat; how should you distinguish between the two?—The purveyor's duties consists in the preparation of the financial accounts of the hospital, the examination of the hospital diet rolls, the providing comforts for the sick which are not contracted for, or provided by the commissariat for the troops.

1739. Are you aware that for the service of the hospitals in the East Indies, both regimental and general, one department only existed, namely, the commissariat, for the supply of all the hospitals?—I am not aware of the existence of that principle.

1740. Did not the two departments clash in the Crimea, one party furnishing and another paying, and one party furnishing some articles, and another party furnishing other articles, so as to appear to be incongruous?—I am not aware of any clashing, but I represented at home that the simplest and most agreeable way, and certainly the safest way for me, as being responsible for the conduct of the department, would be for me to have the whole responsibility of supplying everything required for the sick.

1741. Not to share the duties with the commissariat?—No; but the authorities at home did not agree with me. The instructions issued were that I was to buy such hospital utensils as were necessary, but that the contracts for provisions were to be made by the commissariat.

1742. Are not the duties of the purveyors and of the commissariat in both instances essentially commissariat duties and none other?—Purveyors are the commissaries of hospitals; but their duties go further than that. With regard to general hospitals especially, they have charge of the furniture, bedding, &c., and have much to do with the internal and external order of the hospital.

1743. Is there anything in the service of a general or regimental hospital which is now performed by the purveyor, which might not be equally performed by the commissariat?—I think it would not signify what name the officer went under who performed the duties. The same staff would be required in either case. I think that the name does not in the least matter.

1744. (*President.*) If there was a separate portion of the commissariat devoted to the hospital service, as it is in India, the difference is not so much, except that we have two names and the Indian service one?—I think that the name of "purveyor" does not exactly express the duties that he has to perform. "Hospital commissariat" would answer the purpose equally well; he is the commissariat officer of the hospital; his duties go further, especially in regard to general hospitals. The purveyor of a district at home is undoubtedly the commissariat officer of the hospitals in his district.

*J. Scott
Robertson, Esq.*

20 May 1857.

1745. With this difference, that the commissariat officer rides over them occasionally?—In preparing general contracts for the troops.

1746. Our troops are fed by the commissariat in all the colonies?—Yes; but if the purveyor were satisfied that the bread and meat supplied were not such as were proper for the sick, he has the power to make other arrangements. The great evil is that the existing regulations are in a great measure obsolete, or altered, and that in some respects there are no regulations whatever.

1747. (*Sir Thomas Phillips.*) Do the purveyors at present perform part of the commissariat duties?—Not for the troops.

1748. Why should they not?—I see no reason why they should.

1749. (*Mr. Alexander.*) Would it not facilitate the matter if the purveyors had in their charge all the hospital stores, bedding and everything?—Decidedly; if the purveyor had, from whatever source he received them, all those stores in his own possession and in his own charge, there could be no difficulty in supplying the wants of the sick.

1750. Do you not think that they ought to supply all those stores and keep them in their possession?—I think that they ought. I think that the purveyors should have everything for the use of general hospitals; with regard to barrack or regimental hospitals, it would be almost impossible to do so.

1751. Suppose you had a purveyor's clerk, could it be done in the one case as well as the other?—Yes; but we must very much increase the purveying department.

1752. You have now at Montreal three men to look over one hospital and one detachment; could not those three men also take charge of the barrack furniture?—If we retained those three, there is no reason why one at each sub-station should not perform all the duties required at the hospital, except professional duties.

1753. Is it necessary to have an officer at a small station; could not you give the hospital stores and the hospital furniture over in charge to the steward of that hospital, holding him responsible for the same?—That is to the hospital serjeant?

1754. The steward or serjeant?—He has now the charge of the stores in a regimental hospital. It must be understood that in a regimental hospital the system is for the hospital serjeant under certain restrictions to have charge of everything in the hospital under the surgeon; but when the regiment leaves the station he transfers the stores to the barrack department officer. But if the purveyor did so instead, one of his officers would require to reside on the spot, and there does not appear a necessity for this increase of expense.

1755. According to your previous answer, you consider that you ought to make requisition upon the storekeeper, and that the storekeeper should issue those things to the department. Do not you think that it would be better to have everything, such as hospital, bedsteads and bedding required for the hospital in their own store, and that they should issue them, and have nothing to do with the barrack-master?—Take the case of the purveyor at Quebec, there are two purveying officers there; the purveyor's clerk would, upon your principle, have everything for issue to the hospitals in Quebec; that would answer very well for hospitals in the city itself, but then suppose there are two or three detached hospitals miles from Quebec, but in the same purveying district, and suppose a barrack serjeant to be in charge of each of those stations, it would very likely be attended with inconvenience, if the hospital stores were in the purveyor's possession; you could not send from the purveyor's stores at Quebec as readily as the barrack-master on the spot could supply them.

1756. (*Sir H. K. Storks.*) If he issues, in the first instance, the equipment of the hospital from headquarters at Quebec to the out-stations, they would be in charge of the hospital-serjeant, independent of the

barrack department?—Yes; but under the purveyor the inconvenience would be, that there would be no resident officer to inspect or to receive the stores when the regiment left, and that sometimes the authority of the purveyor over the regimental hospital servants, of whom the steward is one, would clash with that of the medical officer in charge.

1757. (*Mr. Alexander.*) How could they clash?—That depends very much upon the medical officer; probably he would not allow any interference with his steward.

1758. (*President.*) If the purveyor was made responsible for the whole supply of furniture, and the medical officer were relieved from duties of that kind, there would be then no confusion?—None at all; if the purveyor's duties were so defined that he was made responsible for the interior arrangements of the hospital, and had the charge altogether of the stores and the servants, and the cleanliness and everything, and the surgeon had merely to perform his professional duties.

1759. The purveyor being still obliged to provide everything that the surgeon thought necessary for the patients, and in case of his failure to keep the hospital in a proper state, the medical officer having his remedy by complaint against him?—Then there could be no difficulty; but you would have to extend the purveying establishment very considerably to carry out that system effectually.

1760. (*Mr. Stafford.*) How do you mean?—It would require a purveying officer at every sub-station to do that duty properly. At large stations there would be no difficulty. The Cape of Good Hope is probably as good an example as any; the sub-stations there are very numerous.

1761. (*Sir H. K. Storks.*) You would not have a purveying officer for a detachment composed of 50 men?—There would be the inconvenience.

1762. The purveyor would issue a certain number of stores to equip the detachment hospital, and he would give them to the hospital serjeant, who would be responsible to the purveyor instead of to the barrack-master?—That steward would require to be attached to the building to make the system work well; he would be the purveyor's serjeant in charge; if the detachment were removed in a hurry, and the steward was removed with it, and there were deficiencies, who would be responsible if there were no officer of the purveying department to take over the stores?

1763. (*President.*) Is there any one permanently belonging to the building?—The barrack-master or his serjeant.

1764. (*Sir H. K. Storks.*) Not for detachments?—There is always a barrack-serjeant at stations, I think, where there is a barrack.

1765. (*Mr. Alexander.*) Suppose a detachment of 50 men was going out and you were the purveyor at head-quarters, could not the supply for the sick of the 50 be issued and carried with them to the station they are going to, instead of from the barrack department?—I think that the proper way would be to make the hospital stores permanent with the building; if there were room for 50 men it would be to make the equipment in the house permanent, and when the troops move out, the purveyor might take over the stores, and retain them for a subsequent detachment.

1766. (*President.*) Would not the hospital serjeant hand them over to the other hospital serjeant who succeeded him?—He might not be present.

1767. (*Sir H. K. Storks.*) He must be; is not that the practice of the service?—That I cannot answer, I think not.

1768. (*President.*) If it is the practice of the service thus to do the duty of the barrack department, could it not be done in the same way for the purveyor's department?—I have a difficulty in answering those questions, for I have only been connected with the purveyor's department two years. My experience was in the East, and I have had no experience at home to

enable me to speak correctly of the proceedings of barrack-masters and their serjeants.

1769. (*Mr. Alexander.*) You stated that you thought it would be better for the service if the storekeeper or the barrack-master kept those stores; I ask you whether it would not be better for the purveyor's department to have a large hospital store in their charge, and not to go to the barrack department at all?—Upon that understanding you would have him to provide such things originally?

1770. Certainly; and have certain store rooms in each hospital where bedding, blankets, and everything connected with the hospital could be supplied from, without going to any barrack department?—I think it would work very well, apart from the question of economy.

1771. (*Sir H. K. Storks.*) Was not that the practice in the hospitals on the Bosphorus?—Yes.

1772. Did it not work well?—Yes, very well.

1773. Did it work better than if you had applied to the barrack department for the things?—Certainly, but the system was circumscribed. We had large hospitals, and were not troubled with many small detached hospitals.

1774. Could not you apply the same system to a large number of stations?—Certainly we could, but I fear that there would be inconveniences resulting in regard to some of the stations.

1775. (*Mr. Alexander.*) Do you think that there would be any inconveniences in large stations?—No; not where the troops were within a given radius, with a purveyor on the spot.

1776. What inconvenience do you think would arise?—From the transfer, where the purveying officer was not present, of stores from one detachment to another.

1777. If no inconvenience arises now where there is no officer of the barrack department present, why should it occur in the purveyor's department?—I see no reason, if such is the case.

1778. (*Sir H. K. Storks.*) You do not know, of your own knowledge, that such is the case?—I do not. I understand the principle to be, that where there is a body of troops, there will be an officer of the barrack department there. It may not be carried out in every instance, but I think that, as a rule, it will be found that a barrack-serjeant, acting under the barrack-master for the station, is in charge at each barrack.

1779. (*Dr. Andrew Smith.*) Why did you apply to me on Monday last for my sanction to purchase certain candles that were required for the 3rd regiment, which was about to embark for China?—Simply because I consider your authority to me to buy such articles, as paramount.

1780. Am I to understand you, that by your instructions I am the referee as regards anything that you consider to be wanted for a hospital; and that on my authority anything may be procured for the hospital, without the intervention of the War Office?—That was with regard to China. You will understand that my position is not at present defined, but I had verbal instructions from the Under Secretary of State to take your orders in all matters connected with China, and therefore, with regard to the supplies for hospitals in China, I have placed my propositions before you for your approval, and made such suggestions from time to time as I considered proper, and have taken your directions thereupon.

1781. (*Mr. Martin.*) The instance of China being an exceptional one?—The case of China being, with reference to supplies, the only one in which I have been engaged since I came home.

1782. (*Dr. Andrew Smith.*) If I sanctioned the supply, you would furnish it without reference to the War Office?—Yes.

1783. In case of anything else being required for the use of a hospital in camp, and the purveyor made an application to you for it, what course would you take? Would you then refer to me or to the War Office?—With regard to anything not connected with

the army in China, for that is a special case, I would follow only the old system of taking the authority of the War Office for my guidance.

1784. Would the War Office decide at once whether you were to provide those articles or not?—I think they have in several recent cases, in which, for small articles, the purveyor has referred for authority to purchase, and they have allowed it.

1785. Without any reference to me?—Yes; but they were things that did not require a reference to the medical department. In the cases I refer to they were weighing machines, but anything that concerned the sick, such as the description of bedstead, would be referred to you for your opinion.

1786. Suppose that a medical officer were to ask to be allowed to be supplied with oil cloth to cover the surgery table, what would be the course in that case?—The surgeon would in that case either apply to the purveyor in the district, to the barrack-master, or directly to yourself, not to me; I believe the practice would depend much upon the surgeon himself, but in all probability he would refer the matter to you, and you would write to the War Office.

1787. Are you aware that an instance of that kind occurred lately, in which a surgeon applied to the purveyor to be allowed to purchase two door mats, and some oil cloth to cover the surgery table; in that case would the purveyor apply direct to the War Office or to you?—The purveyor would apply direct to the War Office for authority to purchase the articles.

1788. In that case who would decide?—The War Office would authorize the purveyor to purchase, or probably the store branch would be directed to supply the articles.

1789. With reference to this case, are you aware that instead of the War Office deciding one way or another they addressed me on the subject, and wanted my opinion whether those things were necessary or not?—I am not aware that they did so; I should think that it would be a question not requiring much reference.

1790. Are you of opinion that there is any established or fixed regulation in reference to carrying on those duties?—I believe there is not, except the regulations of the War Office itself.

1791. (*President.*) If there were a complete table attached to your instructions, showing what ought to be issued in a large hospital of a certain size, none of those confusions would occur?—None whatever. There is, however, a great want of some clear definition as to where the purveyor's province begins and where it ends, in providing such small articles.

1792. (*Dr. Andrew Smith.*) In answer to a former question, you stated that you thought that the medical officer ought to apply to the purveyor for whatever was necessary for the equipment of the hospital; are you of opinion that the medical officer, from his education and from his occupation, is a person calculated to say what quantity of brooms, and of all kinds of utensils, would be necessary for the working of the hospital?—Does the question refer to general or regimental hospitals?

1793. To either.—In a general hospital, with the purveyor residing within the hospital, I have no doubt he would be the most competent to give an opinion. In a regimental hospital, I should think that the surgeon at present would be the best officer to form a correct opinion upon the matter, there being no purveying officer; but there would be no necessity for the surgeon in either case to give an opinion on such a subject, if the internal conduct and guidance of each hospital was part of the duty of the purveyor.

1794. Do you not think that the purveyor ought to be held entirely responsible that every necessary for the hospital is there, without trusting to the medical officer?—Yes. I believe that the system would work well if it were so. I think that the purveyor, or his officer, ought to be held responsible for the proper equipment of the whole of the hospital establishment. He would have to make his annual inspections instead of the barrack-master and where he saw deficiencies

*J. Scott
Robertson, Esq.*

20 May 1857.

*J. Scott
Robertson, Esq.*

20 May 1857.

he would supply them from his store ; and in the case of damages he would submit the matter for directions to the principal medical officer on the station.

1795. You do not think that the medical officer ought to be required to make a requisition for an additional frying-pan for the kitchen, do you?—I think that the medical officer's professional services are far too valuable, and that he should not be required to perform such duties, but should be relieved as much as possible from every non-professional duty ; therefore it would devolve upon the purveyor or some other responsible officer to perform the work, the purveyor being the most eligible under the circumstances.

1796. You have stated also, in reply to a question that was asked you, that you thought the surgeon and the hospital-serjeant in a general hospital should be held responsible for the bedding and other articles in the wards?—I answered that question upon the understanding that the purveyor has no right whatever to interfere in the internal management of a regimental hospital, and upon that principle I said that there should be a ward-master or a hospital-serjeant who should be and is now held responsible under the surgeon.

1797. Was it not with reference to a general hospital that you gave that answer?—With regard to a general hospital, my answer would depend altogether upon the power that the purveyor had over the servants. If he were supreme over them he could take as much care of the stores in each ward as the surgeon could possibly do ; and he would also be as capable of seeing to the cleanliness and the comfort of the patients and the floors of the building, as the surgeon who makes his visits professionally.

1798. But the purveyor, as he at present exists, has a right to go into the wards of the hospital, and see that the different utensils and the bedding are correct ?—As to the quantities.

1799. Yes ; he at present holds the ward-master responsible to him ; would it not be impossible and inconsistent to make the medical officer the responsible person between the ward-master and the purveyor ?—The ward-master being the servant of the surgeon, if the surgeon gave him orders to take, for instance, a bed or utensils from one ward to another, he would have to obey that order. The purveyor in taking his inventory would find those things deficient, or it may be that they might be missing altogether, and the ward-master's answer to the purveyor would be that he removed them by the order of the surgeon, the surgeon would in that case be the responsible officer.

1800. The ward-master would still have them under his charge, and he would say, "They are not in this ward but in another," and then the purveyor would satisfy himself upon that point?—Quite so ; in that case the things might be found, but in others they might be missing, and probably removed at the instance of the surgeon, in which case you must hold him responsible.

1801. The present practice is for the purveyor of a general hospital to be responsible for all the bedding and other utensils ; he gives them out to the different ward-masters, and he holds them responsible to him, and if a ward-master was in any way to be troublesome, the purveyor's duty would be to go to the principal medical officer and state that such was the case, and his authority would be brought to bear ; do you think that there would be any difficulty in that ?—Generally speaking there might not, but I can conceive of instances in which there would be a collision. I think that the principle is a good one, either to relieve the surgeon altogether of the responsibility of the charge of the stores and of the conduct of the servants in the ward, or to make him entirely responsible for all. Any middle course is, I think, liable to objection.

1802. Suppose now, as is the case at Chatham, that a medical officer goes there to-day and in three days he is ordered away again ; he has become re-

sponsible for two days, what means would there be of holding him responsible ?—That is an exceptional case, and would require an exceptional arrangement. Chatham is a sort of *dépôt* for medical officers.

1803. All general hospitals would be placed under the same circumstances, would they not?—I think not ; but if so it would be absolutely necessary that there should be some permanent ward-master or other officer responsible to the purveyor, in which case it would be necessary for the purveyor to have, as is given him by the old hospital regulations, the supervision of the hospital servants.

1804. Is it your opinion that, for instance, at Chatham it would be practicable for the purveyor to exist as a separate and independent officer in that establishment, and not amenable to the authority of the principal medical officer?—If the principal medical officer is the governing body of the hospital, the purveyor and his officers should act under his direction ; whoever is the governing body should have entire control over everything within the hospital. The question, I think, is, who is the governing body of the hospital ? In 1820 the commandant was the governing officer ; since this rule has become obsolete there is nothing to show that the principal medical officer is supreme in the hospital, but the practice has been, I think, gradually to bring the ruling power within the principal medical officer. I think that that has been the gradual development of the system since the commandant ceased to exist.

1805. Supposing that there was anything connected with the medical duties to enable them to be properly performed, and that the principal medical officer considered that the purveyor ought to take such and such steps, or obtain such and such articles ; and suppose that the governing body, the commandant, did not take the same view with the principal medical officer ; what then would be done ?—I think that then, the commandant being the governing body, the purveyor should not have the power to act upon the medical officer's order.

1806. Then the principal medical officer, who might be a man of perhaps 40 or 50 years' experience, would not be able to obtain for the sick in his establishment that which he considered necessary, because the power of considering whether it was necessary or not would be placed in a military officer of perhaps only one third of his service?—You are supposing one side of the case. When I say that there should be a governing body, and that I think that governing body should be the commandant, I conceive that for the good working of the system you would require most excellent officers, and therefore the best men on the half-pay list of high rank. I do not think that any one should be the commandant of a hospital under the rank of a field officer.

1807. (*President.*) Would not the instructions to the governing person probably lay down directions to him that he was in no way to interfere with any question of medical treatment, but that the medical officer should be supreme?—I think it is so stated distinctly in the old regulations. "The medical officer is to have the sole superintendence of the professional arrangements of the hospital, and all returns and reports from the other medical officers are to be made to him." Under that rule, I think that no commandant would say to the principal medical officer, "You are not to give this or that to a patient ;" nor, with proper regulations, would he interfere with him in the discharge of his duties.

1808. Supposing that the principal medical officer considered the means of cooking were not sufficient, and that additional means of cooking were required, in that case who is to decide?—My opinion is that the board should decide.

1809. Who decides it now?—I think that now, as to the means of cooking, the principal medical officer would request the purveyor to provide proper cooking utensils, or the latter would probably take the initiative himself in the matter, as he would no doubt be the first to find out the want.

1810. He cannot order the purveyor to make an alteration in the hospital?—No.

1811. The purveyor can only apply to the barrack-master, or the engineer, and it must come to the central authority ultimately to decide?—Yes, under the present regulations.

1812. Under the supposed governor of the hospital, would not the principal medical officer, if he could not get justice done to his patients, in the same way write home and apply to the central authority?—I think that the governing body, or the commandant, should be supreme, but that all questions of that kind should be decided by a board in the hospital, composed of the three different departments, and if the principal medical officer conceived that the board did not decide properly upon his application, he could refer to the head officer of his department in London through the commandant.

1813. Do not you consider that by these references to the superior of each department, and ultimately to the central authority here, the Secretary of State is virtually the governor of every military hospital?—Quite so; that is to say, he individually is not, but his department is, properly speaking, so.

1814. Though not being on the spot, he has to judge of everything by correspondence?—Yes.

1815. (*Dr. Andrew Smith.*) Are you aware that about the year 1820 the Commandants of Hospitals and the Commandant-General of Hospitals were discontinued, in consequence of its being found that there were such constant collisions between them and the principal medical officers of the hospitals, that the duties could not be carried on satisfactorily for the good of the soldier?—No; I am not aware that that was the cause of the breaking down of the system, but the necessity for a collision between the governing body and the medical officer, or between the governing body and the purveyor, if the regulations were properly defined, would not exist, I think. I do not consider that the governing body or the purveyor should have any right to interfere with the professional treatment of the sick; and that principle being laid down, there would be no necessity for collision in that respect.

1816. (*President.*) Are you acquainted with the system in the naval hospitals?—No.

1817. Do you know that there is a superintendent at Haslar?—Yes, I do; he is a naval officer.

1818. And that the hospital is remarkably well governed?—Yes. I believe that in the civil hospitals the governing officer is a civilian, but not a medical officer. I presume that the system works very well there; there is no clashing between the medical authorities and the others in the hospital; and I cannot conceive why there should be any clashing, if a military man were the supreme authority in a military hospital. I think it is necessary for the good of the service, that there should be a military man at the head of each general hospital.

1819. (*Dr. Andrew Smith.*) Can you imagine that every military man will take the same view of what is necessary that a medical man will take, and that he will yield to the medical officer's opinion, particularly if he has any reason (and there may be reasons existing) why he should not take the same opinion?—If he were placed in the position of commandant of the hospital, I would consider that he was responsible for any very great expenditure in the hospital, and in that respect he would probably interfere with the recommendations of the medical officer; but with regard to the treatment of the sick, the diets and extras given to them, the amount of accommodation, the cleanliness of the wards, or any question that involved health, I do not think that the commandant or any man of ability would interfere with the arrangements of the surgeon. I think if the commandant had common sense at all he would be guided by it, and would regulate such things as were in his province alone. It would be necessary and proper, if there was any improper conduct on the part of the medical officer or purveyor, for him to

step in and request them to attend to their duties; but otherwise he ought not to interfere with the professional opinion of the medical officer in his treatment of a patient.

1820. Supposing that there was a cess-pool or two attached to the hospital, and that the medical officers of the establishment considered that those ought to be emptied at least every two months, do you think that the military officer would in all cases agree to their proposition and have it done?—It is a very difficult question to answer, but I should think that it would depend altogether upon whether the commandant saw the necessity of it. With regard to a cess-pool there should be no difficulty.

1821. (*President.*) Under the present system, are such requests on the part of the medical officer always attended to?—No; they would be more likely to be attended to under the system of a commandant as supreme.

1822. Did you hear the statement made by Mr. Pratt the other day, that under the present system such requisitions may be made and be unattended to for years?—Yes, it is quite possible; but with power vested in the commandant to require the engineer to perform certain work these delays would probably not occur. There should be a certain limit of expense for repairs, but if the board decided that they were necessary, power should be vested in the commandant to require the engineer to perform the work.

1823. If he considered them necessary?—If the board considered them necessary; but I should think that in a case of the kind referred to by Dr. Smith the opinion of the principal medical officer would be taken as the most important. His opinion upon a sanitary point I would consider much better than mine, and if I were individually concerned I would waive my own judgment to that of the medical officer; but if it were with regard to the enlargement of the hospital, or any other question upon which a military or a civil officer is equally able to decide with the medical officer, in that case I should think that the judgment of the military officer would be quite as good as that of the medical officer.

1824. (*Sir H. K. Storks.*) When you were in the East, who was the paramount officer?—The general officer commanding I consider was so.

1825. Were there many references made to him about the hospitals generally, particularly about buildings and the question of drainage?—Not in my own personal experience; I believe there were sometimes.

1826. Did you ever know any collision take place, or difficulty?—I think not; I know that there was nothing recommended there by the medical officer in my time which was not carried out as far as workmen could perform it. There were, of course, in a country such as Turkey, delays occasionally; but taking all the service into consideration, I do not think that the delays were greater there than might have been expected.

1827. (*President.*) Would not the medical officer always have the option, as he has now, if justice was not done to him, of referring to the chief of his own department at home, and bringing the subject before the Secretary of State?—Quite so; he would have an ultimate appeal; and I think that then the question, being considered by disinterested parties, would very likely be solved in a fair and proper way for all concerned.

1828. (*Sir James Clark.*) Could he make that application directly to his chief, or must it go through his commandant?—I think decidedly that he ought to have the power of appeal, and that the commandant should not have any right to do anything more than pass on the appeal, with such remarks as he considered necessary. He should, as the head of the hospital, know what appeals go forward, but not stop them.

1829. (*Mr. Alexander.*) Do you consider that it is necessary to have the name of every patient in the hospital written on the daily diet-table?—With regard to a question which was put the other day

*J. Scott
Robertson, Esq.*

20 May 1857.

*J. Scott
Robertson, Esq.*

20 May 1857.

and the answer I heard given here, I yesterday prepared a diet-roll, by which I think that difficulty is entirely obviated.

1830. I am talking about the present practice?—By the present practice it is so, but it is not necessary that it should be so. The diet-roll, I think, might be prepared on Sunday, with the names correctly entered, and the diets could then be issued during the week, without any additional names except those that are newly admitted; and I have prepared a diet-roll which I think would answer that purpose.

1831. (*President.*) It used to be a monthly diet-roll, did it not?—Yes.

1832. (*Mr. Alexander.*) Might not monthly diet-rolls, as formerly, be adopted, thereby saving an immense amount of writing?—I would do away entirely with monthly diet-tables.

1833. Do you know the one that I allude to?—Yes, I do, I have it here (*producing the same*). The monthly diet-table is only for meat diet, it does not include extras; I would have merely the weekly diet-roll.

1834. Why not for a month?—Because the form of diet-table is not complete. The roll must be prepared for the purveyor.

1835. Why cannot he take the returns that he conceives necessary from the monthly diet-table?—It would be impossible, as no extras are stated in the monthly diet-table; but in the form I have proposed the system can be carried out for a month upon the same principle, by merely putting in more fly-leaves, but the purveyor should have one weekly. The only difference between the one that is rendered to the purveyor and that which is kept in the hospital would be, that the latter might be made large enough for a month and bound in a book to lie on the ward table for the patients to examine when they thought proper.

1836. (*Sir Thomas Phillips.*) But the purveyor should be supplied with his copy weekly?—Yes.

1837. There must be for him a separate weekly diet-roll?—Yes, to be made up and delivered to him weekly. There are other returns, which are now prepared by the surgeon, which I confess I think it is not his duty to prepare, and therefore I would propose to abolish them. I have brought with me some of the forms which are used in my department, and which I beg leave to hand in to the Commissioners. (*The same were delivered in.*)

The witness withdrew.

*J. C. Steele,
Esq.*

JOHN CHARLES STEELE, Esq., examined.

1838. (*President.*) What position do you hold in Guy's Hospital?—I am superintendent of Guy's. I have the general management of the affairs of the charity under the committee of management.

1839. You are a medical man yourself?—Yes.

1840. But you do not hold your office in virtue of being a medical man?—No.

1841. Was your predecessor a medical man?—No.

1842. Therefore, I presume you perform none of the duties of a medical officer within the hospital?—Not of a special character, beyond the admission of patients, in which I am generally called upon to distinguish which patients are proper cases for admission into the hospital, to distinguish between the surgical and medical and other cases.

1843. That is, being by accident a medical man, it has been found convenient for the hospital to impose duties upon you which would otherwise fall upon one of the medical men?—Yes.

1844. It is not the natural duty of your position as superintendent?—It is not.

1845. As your predecessor was not a medical man, your successor might not be?—He might not.

1846. What had been your previous experience in hospitals?—I have been connected with hospitals nearly all my life. I was bound apprentice to the Edinburgh hospital and resided there for five years during my studies, and afterwards I was appointed superintendent and apothecary to the Glasgow hospital, and resided in that hospital for six years. From that I came to Guy's, and I was there appointed superintendent.

1847. Will you state in outline what are the duties which you perform at Guy's?—I have here the regulations, which have been drawn up since I went there. "The superintendent shall, under the treasurer, have the control of the household, and shall be responsible to the treasurer for the good order and government of the household affairs, in accordance with such regulations as now exist, or shall be issued by the treasurer and governors from time to time. He shall devote his whole time and attention to the duties of his office, and shall not absent himself from the hospital for one day, without the permission of the treasurer. He shall visit the several wards and other departments of the hospital at least once every day, and see that the bye-laws and standing orders are strictly complied with. He shall exercise a general superintendence over all persons employed within the establishment, and shall

engage and suspend, at his discretion, all the male servants, with the exception of those appointed by the court of committees. He shall report to the treasurer, at the weekly meeting, the names of all persons so hired or suspended, together with the cause or causes thereof. The superintendent shall report weekly on the state of the house, stating the number of patients admitted, discharged, or dead, during the previous week, specifying whether medical, surgical or lunatic; and he shall keep a narrative of all occurrences relating to the business of the hospital, which he may consider of sufficient importance to communicate to the treasurer and committee for taking in-patients, and make such observations or suggestions thereon as he may think conducive to the welfare of the establishment."

1848. What staff have you under you?—For the peculiar duties attached to my office, I have two clerks in my office.

1849. Have you a steward under you?—I have a clerk who has charge of the supplies.

1850. Who does the duty of steward?—Yes.

1851. What number of beds have you in your hospital?—540.

1852. Do you include in that number the lunatics?—Yes. There is a small establishment for lunatics.

1853. (*Mr. Stafford.*) How many beds are occupied in the hospital?—Generally speaking there are about 460 beds occupied daily, on the average, throughout the year.

1854. (*President.*) You are very full now, are you not?—We are; we have about 500 patients at present in the hospital.

1855. Is it the duty of any particular person to attend to the ventilation of the wards?—It is the duty of the clerk of the works to attend to all the works and improvements about the hospital, and it is the duty of the sisters of the wards to attend to the ventilation of the wards.

1856. The sisters are held responsible for the cleanliness of the wards?—Yes; they are held responsible for there being free ventilation.

1857. And for the cleanliness of the patients?—Yes.

1858. And the care of the furniture?—Yes, and to take charge of the diets, and the bed linen of the wards.

1859. Is it the duty of any particular person to attend to the state of the water-closets daily?—Those

sisters have the full charge of the wards, and it is the duty of a man to go round the hospital once a week to examine into the state of the water-closets.

1860. Whose duty is that?—The clerk of the works of the hospital, a kind of engineer. He is resident in the hospital.

1861. For the sanitary condition of the hospital, you trust to the reports of the nurses, and the clerk of the works?—Yes, and from my own superintendence. I have to pass through each department daily, to notice whether there are any deficiencies in any particular department.

1862. Are the supplies attended to entirely by your clerk?—Entirely.

1863. Does he make contracts?—He makes contracts with the parties who send us the provisions.

1864. Are the contracts made on your recommendation, or your clerk's?—My own.

1865. Do they depend a great deal on the recommendation of the clerk?—Yes.

1866. Who is it that makes the payments?—The accountant makes the payments by money received from the treasurer. The larger payments are made half yearly, and the small ones are made quarterly.

1867. You represent in the hospital the committee of governors when they are not actually sitting?—Yes; I make a weekly report to them.

1868. Do you interfere in any way with the treatment of patients?—No. We have one resident house surgeon, and a resident apothecary.

1869. Whatever is ordered by the medical man is supplied without question?—Yes. Such things as surgical apparatus, if not in common use, or medicines, if of very great value, are sometimes not supplied.

1870. In case a thing is pressed for by the medical officer, where does the appeal go?—To me, in the first instance, and I take it then to the treasurer and the weekly committee. This rule refers to that:—"He shall insert in a book, to be laid before the treasurer, a note of all medicines, surgical instruments, stationery, articles of diet, and everything that is needed for the supply of the hospital. It is expressly ordered that no article shall be got for the hospital unless with the sanction of the superintendent, and under his signature, previously obtained."

1871. That is for the financial statement of the establishment?—Yes.

1872. The medical officers exercise no authority in the hospital except with regard to the treatment of the patients?—Except with regard to the treatment of the patients, they have no authority whatever.

1873. They expect to find everything ready to their hands?—Yes, they do so.

1874. If not, they would make a complaint to you, I presume?—Yes. Whatever recommendation they choose to make is generally attended to by me or by the committee.

1875. Practically, does it often occur that they apply for instruments or for diet which you consider too expensive?—Very seldom indeed; we generally agree to their wishes with regard to diet of all kinds.

1876. I suppose there might be some hesitation when something new was introduced at first?—Yes, something that might be introduced for the first time and of considerable value, besides being of questionable utility; the matter is referred to the committee, and they decide whether it shall be given or not.

1877. You supply them with microscopes and everything of that kind, I suppose?—Everything that has any connexion with the medical school of the hospital is supplied from funds which are entirely independent of the hospital funds.

1878. Who superintends the cooking; is that under your clerk?—That is under the housekeeper's care.

1879. The matron?—No. The matron in Guy's hospital has charge of the servants, the nurses, and the sisters, and the housekeeper has charge of the kitchen department, and attends to the diets.

1880. Your washing is done in the hospital, is it not?—Yes, entirely.

1881. By your own servants?—Yes.

1882. Does that answer well?—Yes. It is very efficiently done, and we can do it much cheaper in the hospital than we can outside the hospital.

1883. Will you describe the process by which the diet-rolls are made up, and the check which you have upon the provisioning of the hospital?—Each patient has a bed-card placed above his bed, in which all the medicines prescribed are put, and also the diet. There is a separate column for the diet. The medicines are put in this column (*pointing to the form*). The diet is mentioned once, and if a change is made it is noted; probably the patient may be taking the same diet for a month upon the same order.

1884. How many diets have you on that table?—Only one here, but on the diet-roll we have got five. This is the diet-table (*handing in the same*). We have five different kinds of diet.

1885. Do they enter from that bed-ticket the particular diet which a patient is to have for the day?—Yes.

1886. How is that conveyed to the steward?—The sister of the ward, who has charge of it, writes out on a piece of paper daily the number of patients on particular classes of diet, the number upon extras, but not the names of the patients, because each patient has a separate number. We uniformly number the patients instead of recognizing them by name, and these are entered in this list (*handing in the same*). These lists are taken to the housekeeper by the sisters, and transferred by her to the score. She then makes up the general returns for the day from this score, and sends the same to the butcher who supplies the meat.

1887. The housekeeper?—Yes, she does, and her accounts come into the steward's office daily.

1888. She orders upon a standing contract?—Yes.

1889. (*Sir Thomas Phillips.*) She ascertains the quantity that is wanted?—Yes. Probably there would be twenty of these papers sent to her, and she transfers the totals from the papers on to her slate, and she can tell at a glance how many diets are required for each ward, what number of pounds of meat are required.

1890. What is your check upon her that she does not order more than is wanted?—We have a return from the steward's office made up from those papers also, and we can compare at any time the amount that is said to be required.

1891. Do you compare them habitually?—No, only occasionally; we put so much confidence in this person.

1892. Do you know what the cost of your hospital is, whether it is economically conducted; take the diets first?—Yes.

1893. (*Sir Thomas Phillips.*) Do you do what is done in some establishments of the kind, that is, analyse the distribution of the supplies, so as to show that there is so much meat distributed on full diet each day, and so much on half diet, and so check the aggregate quantity by the number of patients on each particular class of diet?—No.

1894. But that would give a perfect check, would it not?—Yes. If it were required we could do it very easily, but we never have done it.

1895. (*President.*) You do not have recourse to that check, because, I suppose, you can judge pretty well whether there has been any extravagance or not?—Yes.

1896. What do the diets cost upon an average per day?—I can tell you what the patients cost daily.

1897. (*Mr. Stafford.*) Including the medicines?—Yes, including everything.

1898. (*President.*) Including the salaries of the attendants?—Yes, and also of the medical officers. The expense of each patient in Guy's Hospital has been 4l. 12s. 6d. during the last year. The average number of days resident was 33.

J. C. Steele,
Esq.

20 May 1857

J. C. Steele,
Esq.

20 May 1857.

1899. (*Sir Thomas Phillips.*) What is the cost per bed?—The cost per bed per day of each would be about 2s. 9½d.

1900. That is nearly 50l. a bed?—About 50l. Taking 460 patients per day, the daily expenses of the hospital for the maintenance of patients would amount to about 63l. 5s.

1901. Cannot you tell us how much it is per bed?—No; the fairest way of calculating that would be to take 460 patients, as the average number resident daily in the hospital, without reference to the number of beds the hospital contains.

1902. (*Sir H. K. Storks.*) Have you 460 patients as the average number in the hospital?—Yes, 460 has been the daily average during the past year.

1903. (*Sir James Clark.*) Is the clerk of the works permanently attached to the hospital?—Yes; he is resident within the hospital, and he has a staff of some 20 workmen connected with him.

1904. Are you quite satisfied with the ventilation of the hospital at present?—Yes. There are two hospitals at Guy's; one is ventilated by the common free method—that is, the old one which was built by Guy; and the other is ventilated upon a new principle by Mr. Sylvester, an approved artificial and mechanical principle; but the medical men are not so satisfied with the new principle as they are with the old.

1905. Is the new system an expensive one?—Yes, it has been attended with considerable expense.

1906. (*President.*) Except that, the construction of the new hospital must have been cheaper than the old, for you have four sets of beds between two outside walls?—Yes.

1907. (*Sir James Clark.*) Do cases of erysipelas occur in the wards?—Very frequently in the surgical wards, but not in the medical wards.

1908. Have you any cases of pyæmia?—Yes, cases of pyæmia occur very frequently in the treatment of severe surgical operations, and render them very fatal.

1909. Do you find the cases of erysipelas as frequent in the old hospital as in the new?—The new hospital is entirely set apart for the treatment of medical cases, and the old hospital for surgical cases. We have very few cases of erysipelas among the medical cases. When it springs up in a surgical ward we frequently transfer the affected patient to the medical ward.

1910. Have you cases of diarrhœa occurring among the nurses?—No; I have noticed little or none in Guy's since I have been connected with it, as occurring amongst the officials.

1911. Are they attacked with fever occasionally?—I have known only of two instances in which the nurses have been attacked with fever in the treatment of fever cases. Our fever cases are mixed up with the other patients, and I have known but one instance in which a patient was attacked with disease taken from a person in the next bed suffering from fever.

1912. What is the distance between the beds?—There are about six feet between the beds.

1913. Have you many cases of fever admitted?—In some seasons we have a considerable number. At present the number of fever cases amounts to twelve or fourteen, and at present in the hospital those cases are distributed amongst the others.

1914. (*Sir Thomas Phillips.*) Is the fever peculiar to the locality?—No, it is not prevalent in the locality.

1915. Is it low fever?—Different forms of typhus.

1916. (*Sir James Clark.*) Is the drainage perfect?—It is very good.

1917. What cubical contents do you allow for each patient in the wards?—There is no regular system but we consider that the beds should never be placed closer than six feet apart.

1918. (*President.*) What does that give you in cubical contents?—We have wards of different sizes. I think the average amount of room is about 1,600 cubic feet in the old building, and in the new build-

ing it extends to as much as 1,800 or 1,900 cubic feet.

1919. What is the proportion of the different patients in your hospital, of the surgical and the medical cases?—Out of 460 cases there are about 260 surgical cases, including under that head diseases of the eye and venereal diseases, and the remainder are medical cases.

1920. Have you any special department for the treatment of female diseases?—One ward is set apart for the treatment of females with diseases of the womb. With regard to midwifery cases we have a large lying-in charity attached to the hospital for the use of pupils; there are about 2,000 women annually delivered from this charity.

1921. Have you a special ward for children?—No, but the number of children treated in the hospital is very large; at one time it was the rule to have wards set apart for children, but it has been found very much better to mingle them in the female wards with the patients; the female patients take charge of them, and they are much quieter, and get on better, without their mothers.

1922. What is the earliest age at which you admit them?—We take them in as early as one week old.

1923. What number of lunatics have you in your establishment?—Only 15 lunatics now: we had at one time 24; they are all incurables, hopelessly insane, and they must be, according to Mr. Guy's will. But the governors do not intend to continue to take in any more lunatics.

1924. What is the number of your medical officers?—There are four senior physicians, who have the charge of the medical wards, with two obstetric physicians, making six senior physicians.

1925. (*Sir Thomas Phillips.*) You are now speaking of the honorary officers?—No; they are all paid at Guy's, with the exception of the treasurer.

1926. (*Sir James Clark.*) How many surgeons?—We have three senior surgeons in connection with the surgical wards, and one ophthalmic surgeon.

1927. How many assistant physicians and surgeons are there?—Three assistant-physicians, and three assistant-surgeons.

1928. You have not, then, an assistant-physician to each physician?—No, because the appointment of the fourth senior physician is only temporary; it is intended that it should die out.

1929. What number of clinical lectures are given?—About 50. All the pupils are allowed to report, but we have clinical clerks attached to the clinical wards; each physician has two; there are, therefore, eight clinical clerks attached to the two clinical wards, and that appointment is considered a higher office than the regular reporter of cases. From their reports we select the best pupils to fill the best offices.

1930. Are the clerks appointed for any particular time?—Yes; for three months in the summer, and for six weeks in the winter.

1931. Who examines the reports?—There is a medical council formed to examine the reports, and to select, according to merit, the best pupils to fill the highest offices in connection with the charity—the clinical clerks and dressers.

1932. (*President.*) Do they write down a description of the disease, the treatment, and the general conclusions?—Yes, the history of the case, noting the daily symptoms of the case in the hospital.

1933. Do the pupils select any case that they like?—No, they take their week about, according to the number of persons admitted; each clerk takes his week in rotation, and he writes out the previous history with the present condition of each case admitted.

1934. Does the pupil select which case he pleases?—No; the physician orders him to do that.

1935. (*Sir James Clark.*) What number of dressers have you?—Twelve; there are four attached to each of the senior surgeons.

1936. Are they appointed in the same manner?—Yes, they are selected in the same manner.

1937. Are they selected for merit?—Yes, they are.

1938. In that manner do all the pupils of the hospital go through those two classes, the dressers and the clerks?—They cannot all be appointed to the office of dresser; there are only twelve appointments every six months; the number of the pupils attending will be about 180, and it is therefore impossible that they can all attain those offices.

1939. Is it not very desirable that they should do so?—Yes; but if we increase the number it would not give each dresser a sufficient amount of work to do.

1940. (*Sir Thomas Phillips.*) You mean that it would be desirable for the student himself?—Yes, very desirable indeed for the student in the course of his education.

1941. Is any other instruction given to the pupils?—Yes; clinical instruction is given to the pupils in the winter. Each of the senior physicians takes charge of two wards in the winter, and he selects cases for those wards which are of great interest and value. Upon these he makes his comments daily in the wards. The system of clinical instruction is carried out remarkably well in Guy's—better there than in any other hospital that I have seen.

1942. (*Sir James Clark.*) Are all the physicians going on at the same time with clinical lectures?—No; each physician takes two months in his turn during the winter; last year they each took six weeks.

1943. The ordinary physicians do not give any clinical instruction?—Yes; they make a few remarks at the bed-side of each case, and their visits are always attended by the pupils.

1944. How and by whom are the medical officers appointed?—By the governors.

1945. By the whole of the governors?—By the whole body of the governors.

1946. What is their number?—The number is 60, but it is very rare that more than 20 would attend any meeting.

1947. Are the medical officers consulted about the appointments?—They are not consulted.

1948. Is that a good plan of appointing medical officers?—Both the physicians and the surgeons are selected from the medical school of the hospital. It appears that the governors have never gone beyond their own school; but I think if they went further and selected men from the other schools they might possibly obtain a superior class of teachers to fill the various offices in the hospital.

1949. Are your physicians and surgeons always selected from the assistant physicians and surgeons of the hospital?—As far as I know they have been, with one exception. There was one assistant-surgeon who remained, I believe, all his lifetime as assistant-surgeon.

1950. Is it necessary that a man should have been an assistant-physician or assistant-surgeon before he becomes a physician or a surgeon?—I believe not necessarily so, but the rule has always been so.

1951. For what period are they appointed?—For life.

1952. Are the assistant surgeons and physicians also appointed for life?—The assistant surgeons and physicians are all life appointments.

1953. Do you think that that is a good plan?—No; I think it would be preferable if they were appointed for a shorter period, say for 10 or 15 years, and by the end of that time it would be known whether they would be of further use to the medical school, or to the hospital.

1954. (*Sir H. K. Storks.*) Making them eligible for re-appointment?—Yes.

1955. (*Sir James Clark.*) Would that be a better arrangement for the institution?—Yes; and not only for the institution, but better also for the medical school in connection with the institution, because from the body of medical officers the teachers are always selected.

1956. Have you a pathologist?—Yes, who is also an assistant-physician, and who is connected with the museum.

1957. Does he give instruction to the pupils in pathology and morbid anatomy?—Yes, daily in pathology in the post-mortem room. He also gives a few lectures upon morbid anatomy in the general theatre; but it is quite an accident he is an assistant-physician at the present time, because the appointment is singular in itself.

1958. Do you think that the clinical instruction given at Guy's is upon the whole given as well as in any other hospital?—I think it is given upon a very first-rate plan; it is attended during the summer months as well as in the winter. The assistant-physicians during the summer months always give clinical instruction; they have then charge of the two clinical wards.

1959. You consider, I presume, that every pupil should be instructed at the bedside of the patient individually, so as to be able to treat diseases?—I think it is very desirable that every student in medicine should be instructed personally in the nature of disease by the bedside of the patient, and also that he should act as dresser, and be able to manipulate carefully.

1960. Do you think that any man should be licensed to practise medicine without his qualifications having been tested practically at the bedside of the patient?—It is the system throughout the country that there is no examination of that kind required, but I think it would be very desirable if it were otherwise. With the exception of the India Board, I believe none of the examining boards require a student passing to be examined in manipulation by the bedside.

1961. Do you not think that every physician and surgeon in the hospital should be required to give instruction to the pupils at the bedside of the patients?—Yes, every one who has patients. The chief duty of the assistant-surgeons is to attend to the out-patients' department of the hospital. I think it should be the duty of every medical officer at the hospital to give instruction to the pupils; it is usually done.

1962. (*Sir Thomas Phillips.*) Is your out-patient department a very large one?—Very extensive.

1963. What number do you relieve in a year?—36,000 last year.

1964. (*President.*) Is the cost of supplying them with medicines included in your gross estimate?—No, I deducted the amount of medicine likely to be supplied to them from that charge.

1965. Is the new system an expensive one?—If the question alludes to the arrangements of the new hospital, I would say that from the greater uniformity in the size of the wards, and the more equable distribution of labour, which is the consequence of the arrangement, that the expenses attending it will not be found so great as in the old buildings.

1966. (*Sir James Clark.*) What number of nurses have you in your hospital?—We have three classes of nurses; one class is called the sisters, who have chief charge of the wards, and who have charge of the regular day nurses and night nurses; the number of sisters is 18.

1967. Have you more than one sister in a ward?—No, never more than one. The number of day nurses is 27, and the number of night-nurses is 23. Then we have a class of people called helpers or ward servants, who scrub and clean the floors.

1968. (*President.*) The nurses never do that, do they?—They do a little in that way, but we are trying to separate the nursing work as much as possible from the cleaning.

1969. (*Sir H. K. Storks.*) Are the ward scrubbers women?—All; we have no male nurses.

1970. (*Sir James Clark.*) What is the size of the wards?—I calculate that one nurse should have charge of 24 patients.

1971. (*Sir Thomas Phillips.*) And also the sisters?—Yes, but their wards are very different in size; in the

*J. C. Steele,
Esq.*

20 May 1857.

J. C. Steele,
Esq.

20 May 1857.

new building the wards hold 50 patients, and there is one sister who has charge of those 50 patients, with four nurses under her.

1972. (*Sir James Clark.*) Two day nurses and two night nurses?—Yes.

1973. Are all the nurses permanently resident?—Yes, but they are not boarded.

1974. (*Sir Thomas Phillips.*) Do you refer to the night nurses?—Neither the night nor the day nurses are boarded; they go out and bring in their provisions with them.

1975. (*Sir H. K. Storks.*) Where do they cook them?—They cook them in the wards.

1976. (*President.*) Is that a good plan, do you think?—No, it is not.

1977. (*Sir H. K. Storks.*) Do they sleep in the wards?—No, they do not.

1978. (*President.*) Have they separate apartments?—The nurses have dormitories in different parts of the building, entirely separated from the wards. The sisters all sleep in the wards, or rather in rooms attached.

1979. (*Sir James Clark.*) What duties do you allot to the sisters?—They have the general superintendence of the wards, and they are responsible to the physicians for the medicines and wines and for the cleanliness of the patients. They have charge of the ward furniture and the bed linen, and also, if they wish to be very assiduous in their duties, they correspond with the friends of the patients with regard to their comforts.

1980. How are they paid?—At the rate of 50*l.* a year.

1981. From what class of life do you generally obtain your sisters?—We try to get them from as good a condition in society as we can. There are several widows of professional men, governesses, teachers, and reduced ladies.

1982. (*Sir Thomas Phillips.*) Besides the 50*l.*, do you give them rations?—No, only an allowance of porter, a little allowance of milk, and no clothing nor washing.

1983. (*Sir James Clark.*) When they become old, do you pension them?—We have a superannuation fund, and they pay quarterly into that a certain amount. The governors also give a similar amount, which provides them with a retiring allowance of 12*s.* a week at the age of 65.

1984. Then they are, generally speaking, pretty well educated people?—Commonly speaking, they are rather of a higher class than the ordinary nurses.

1985. What is the general conduct of your nurses?—That depends a good deal upon the superintendence of the sister; generally speaking it is pretty fair.

1986. Does your system of nursing work well?—Remarkably well.

1987. There is no improvement that you could suggest?—I think it would be a great improvement to introduce male officials, or orderlies, into the surgical wards of the hospital; they are sometimes much required, and there are many duties that you can scarcely ask a woman to perform in connection with venereal cases, and also with bad surgical cases; the men, when helpless, are very heavy weights to lift in and out of bed, and it would be very useful if we could

obtain the services of one or two orderlies for such cases.

1988. (*Sir Thomas Phillips.*) Do not the dressers dress the cases?—Yes, but they do not attend to the shifting or the cleaning of the patients; they do not usually dress very bad cases, such as extensive burns.

1989. Is your treasurer the administrative officer, and the person who has absolute control in the hospital?—Yes, he has absolute authority in the hospital; he is our executive.

1990. (*Dr. Andrew Smith.*) What is the exact object of this bed-head ticket?—The object of it is to get a record of the medicine prescribed, and the treatment that is adopted; it goes to the apothecaries' shop, as well as to the kitchen.

1991. Is that the only record that you keep of the patients' disease?—There is also a record kept by the reporters in their books, and that always remains in the hospital.

1992. If anything was wanted to be ascertained with reference to John Scott, could it be ascertained?—Yes, the official record is kept in a book at my office.

1993. And the nature of the disease?—Yes; besides that, I should add that over each patient's bed there is a card that states the nature of his disease, his name, the date of his admission, the date of his discharge, and the result.

1994. Is not that liable to get lost or mislaid?—It is always fixed in a little pasteboard case, and is not liable to be mislaid.

1995. When it goes to the pharmacy, does it generally come back to the patient's bed-head?—It is carried by the sister to the pharmacy, where it is entered by the apothecary, and it is taken away again by the sister.

1996. (*Mr. Alexander.*) You do not keep a register of all cases in the hospital?—Not a detailed account of every case; the majority are pretty well kept. There is always a register kept of every case.

1997. But there is very little writing in those cases, I presume?—Very little.

1998. And the students keep them, I suppose?—Yes, except that the physicians sometimes keep notes in their private books.

1999. (*Dr. Andrew Smith.*) Do not they keep the records of the clinical cases?—The cases in those wards are kept very much better.

2000. Do the books in which those are entered remain as the property of the establishment?—Yes.

2001. (*Mr. Alexander.*) Those cases are detailed more fully?—The clinical cases are detailed very minutely and extensively.

2002. They are compelled to detail each case?—Yes, and they are compelled to read it aloud to the physician when he goes round each day.

2003. On the discharge of a patient, are remarks made with regard to the treatment, whether it has been successful?—The result is always mentioned under four heads, cured, relieved, unrelieved, died.

2004. Do you enter the post-mortem examination at the foot of the case?—Sometimes it is. There is also a very accurate record kept of the post mortem by the pathologist, besides that which is kept by the clinical clerk. This is the form in which the report is made (*the same being handed in*).

The witness withdrew.

Adjourned to Friday next, at One o'clock.

Friday, 22nd May 1857.

PRESENT :

The Right Hon. SIDNEY HERBERT, M.P.
 AUGUSTUS STAFFORD, Esq., M.P.
 Col. Sir H. K. STORKS, K.C.B.
 Dr. ANDREW SMITH.
 THOMAS ALEXANDER, Esq., C.B.

Sir THOMAS PHILLIPS.
 Sir JAMES CLARK, Bart.
 JAMES R. MARTIN Esq., F.R.S.
 Dr. JOHN SUTHERLAND.

PRESIDENT, The Right Honourable SIDNEY HERBERT, M.P.

JOHN ROBERT TAYLOR, Esq., C.B., examined.

J. R. Taylor,
Esq., C.B.

22 May 1857.

2005. (*President.*) You are deputy inspector-general of hospitals, are you not?—Yes.

2006. Where are you stationed now?—At Fort Pitt.

2007. Have you all the army hospitals at Chatham under you?—Yes.

2008. There are three hospitals, are there not?—Yes.

2009. How many patients are there in them?—I think there are 450 just now.

2010. (*Mr. Stafford.*) How are they divided?—The general hospital at Fort Pitt is for invalids.

2011. What are the numbers in that hospital?—At present 123. The garrison hospital is for the sick of the provisional battalion, and the Engineer hospital is for the sick of the Royal Engineer corps.

2012. What are the numbers in each of those?—The number varies every day. Just now the numbers are, in the general hospital 123, in the garrison hospital 230, and in the Engineer hospital 76.

2013. (*Sir H. K. Storks.*) You do not know the number for which the hospitals are calculated?—Not exactly; I could give within 20 of the number.

2014. (*President.*) Will you be so good as to fill in the numbers?—Yes. (They are for the general hospital 386, garrison hospital 358, and the Engineer hospital 126.)

2015. Are the wards sufficient for the number of patients they contain?—At present they are.

2016. That is, that the patients being fewer in number, a good many beds are unoccupied?—Yes.

2017. That gives a larger number of cubical contents to each patient?—Yes, at the present moment, because we scatter the patients when there are few.

2018. When the hospital is full or in its average condition, are the wards large enough?—Certainly not. The allowance of space is very small.

2019. What is the allowance calculated for each bed?—I have a specification of the allowance in each hospital. There are two buildings in the general hospital, the upper hospital and the casemates. In the upper hospital there is the ground floor and the upper floor, and the size of the ward is different on the two floors. In the lower ward the length of each room is 59 feet, the height 13 feet 10 inches, the breadth 22 feet 10 inches. The width of each bed is 31 inches; the length of the bed is 6 feet; the distance between the beds laterally 22 inches; the distance between the feet of the beds 9 feet; the number of beds in each ward 27; cubic feet for each patient 690. In the upper room the wards are not so high, the cubic space is 640 when the ward is full.

2020. What is the height of the upper ward?—The height of the upper ward is 12 feet 10 inches, and 13 feet 10 inches in the lower one; there is a foot difference.

2021. That space between the beds is less than is laid down in the hospital regulations, is it not?—No; at least I am not aware.

2022. Who decides upon the number of patients who are to be placed in each ward?—I regulate that. In a great measure the thing regulates itself; it is laid down for so many patients, and you receive so many.

2023. By whom is it laid down, by the barrack department?—By the barrack department I imagine.

2024. There is painted on the door of each ward in the hospital the number it will contain?—Yes.

2025. And you would think yourself bound to put in as many patients as that?—You are obliged to put in as many as that; they would not find you any extra accommodation.

2026. (*Mr. Alexander.*) They would not provide fuel?—No.

2027. (*Sir H. K. Storks.*) It is in the same way as the barrack department would provide for men in health?—Yes, everything would be regulated according to a scale, so many for that ward.

2028. (*President.*) You scatter the patients, do not you?—I do when the wards are not full.

2029. You have three wards which would hold how many?—Twenty-four patients and three orderlies.

2030. If you had patients enough to fill two of the wards according to that scale, but you had the third empty, then you would put the patients into the three wards and a smaller number in each ward?—Yes.

2031. You would have no difficulty as to fuel and light, would you?—No; my requisition would be sufficient.

2032. Are they well ventilated?—I conceive not.

2033. There is a good deal of foul smell in them, is there not?—The wards are very foul in the morning, when the patients get up,—remarkably foul.

2034. Speaking of the hospital below, the Brompton hospital, are the privies in good order?—At the garrison hospital they are not, the water-closets are out of order just now.

2035. Is there not a good deal of foul smell all through the corridors?—Not generally speaking. There is when the closets are out of order.

2036. Is it not the practice, in that hospital, to keep the water-closets closed in the day, as if they were much used they would get out of order, and be foul?—If they are kept closed during the day, that depends on the medical officer; I think he keeps them closed during the day, so that they may not be used by every man indiscriminately.

2037. That they should not be used by anybody during the day?—Patients perhaps, who required the use of a water-closet, would be placed near one, that would be left at their service.

2038. What is the reason for that?—If you left all the water-closets open during the day, they would all get out of order, for no men, however well, would trouble themselves to go to the privies.

2039. Have you seen the water-closets in the naval hospitals?—They are very superior.

2040. They are not kept closed, are they?—They do not appear to be so.

2041. The reason that they are kept closed at Brompton is, is it not, that they are not effective for their purpose, and the fear is, that if they were constantly used they would become offensive?—I think it is on account very much of the carelessness of the soldiers; it is well known that they stuff all sorts of things down them and put them out of order.

J. R. Taylor,
Esq., C.B.

22 May 1857.

2042. Are soldiers more careless than sailors?—I do not know about that; I take the soldiers as I find them; if a water-closet can be got out of order, the soldier contrives to do it.

2043. Have you got an ample supply of such things as crockery, glass, and so on, in your hospital?—Not at present; we are to have a complete establishment of everything.

2044. You are dependent for those things upon the barrack department, are you not?—Yes, the purveyor receives at present from the barrack department the sort of stores which he uses in the hospital.

2045. But do they give to each man a plate?—He has a plate and a basin.

2046. And a tin cup?—Yes, a tin mug.

2047. Do they use the tin cup?—They do not like it; they prefer having their beer out of a basin.

2048. Why do they object to the tin cup?—I do not know, except that they will not use it.

2049. Does it corrode?—It gets very nasty-looking very soon.

2050. (*Mr. Stafford.*) Is it to be continued?—No; there is a thorough alteration taking place in the system of furnishing the hospitals now: the general hospital is to furnish everything; we are to be independent of the soldiers' kits, for their knives, forks, and spoons.

2051. (*President.*) The soldier's kit, though it furnishes those things, does not furnish the cup, does it?—No; we give them plates and a basin or bowl. I think the basin answers very well for the tea; perhaps a mug would be better.

2052. Do not they drink first in the morning tea or coffee; then at dinner they drink their soup; then, after dinner, they drink their beer out of it?—Yes; after the dinner the beer is given to them in a basin.

2053. And they drink their medicine out of it, do they not?—No; the medicine is served up in gallipots: if a draught is sent for, it is sent in a gallipot, a little crockery cup, a very good thing for the purpose.

2054. (*Sir James Clark.*) It is difficult to carry, rather, without spilling, is it not?—You might have a more convenient utensil.

2055. (*President.*) In a naval hospital, what do they take their medicine in?—I think in tumblers.

2056. A glass?—Yes.

2057. Do they have a cup and saucer?—No.

2058. But they have a mug?—Yes.

2059. And they have a complete set of crockery there, belonging to themselves?—They are perfectly independent of any other persons for their supplies.

2060. Is it not impossible almost to drink any hot liquid out of tin?—Yes.

2061. (*Sir James Clark.*) You stated that draughts were sent up in a gallipot, how do you give a mixture?—That is furnished in a bottle.

2062. (*Sir H. K. Storks.*) How does the patient drink it?—It is poured into a gallipot.

2063. (*Sir James Clark.*) Have you no small bottles for draughts?—Yes, we have, but they would be poured out of it. Suppose I am at the bedside of a man and say, fetch the man such and such a draught, the orderly would take the prescription with the gallipot, and bring up the draught.

2064. (*President.*) As regards ablutions, how do the men wash in Fort Pitt?—They have an excellent ablution room in Fort Pitt, and there the men go who are able to leave the ward, those who cannot, have a basin and towel brought to them by the orderly.

2065. Have you a sufficient supply of those?—Yes.

2066. Have you at Fort Pitt?—Yes.

2067. In the hospital below, have you?—At Brompton Mr. Maclean seemed to think that he required more basins, but I do not know where he would put them if he had them.

2068. Why not?—He has no place.

2069. Are there no cupboards?—There is a little cupboard about 18 inches square quite unfit for the purpose.

2070. Cannot that be remedied?—I cannot say that. I know that fresh cupboards have been applied for, but I do not see where you could put them.

2071. You would have to go the barrack department to send for an engineer?—I should probably have to represent the subject to Doctor Smith in the first instance.

2072. You get the jack towels from the barrack department, do you not?—Yes.

2073. And the purveyor only buys the square towels?—They are the soldier's own; the little towel is the soldier's.

2074. It comes in with his kit?—Yes.

2075. That is in future to be supplied to him, is it not?—Everything, without exception.

2076. Have you a good kitchen?—It is pretty fair; it answers the purpose very well: it is not sufficient for roasting.

2077. (*Sir H. K. Storks.*) What can you cook in it?—There are two kitchens; the larger one is fitted up with boilers and dressers in which the soup is made, and the potatoes and meat are cooked; the smaller one is for cooking extras, such as mutton chops and puddings.

2078. (*President.*) What is the size of the large kitchen?—I should think about 30 feet square.

2079. And the little one is how large?—I suppose it is not more than 13 feet.

2080. (*Sir H. K. Storks.*) Is there an oven in the smaller kitchen?—Yes; it can bake 16 puddings at a time.

2081. (*President.*) Not more?—No.

2082. In the other, in the large one, you have no means of baking at all?—No.

2083. Therefore you give boiled beef and soup every day?—Yes, but every medical officer can order his patient any other diet he chooses, roasted and fried; he has only to say so, and it is done.

2084. Yes, but you are dependent upon this little closet which you call the extra kitchen, where the accommodation is so small, that they can only bake 16 puddings at a time?—Yes.

2085. (*Sir H. K. Storks.*) You cannot roast in the small kitchen?—Moderately; if you order a man roasted meat, it is understood it is baked or fried; to roast, you must roast a joint.

2086. Then the mutton chops are always fried?—They are done on a gridiron.

2087. Is there a fire-place?—Yes, the men prefer meat fried to anything else, and if they can have their meat fried, they do.

2088. (*President.*) Is there not a great disadvantage in cooking, now that the privies are almost next door to the kitchens, at Chatham?—There is a great disadvantage there.

2089. They are very often offensive, are they not?—They are not immediately next door, but very close to it; they are very offensive.

2090. Have not many applications been made to the engineers' department to correct that evil?—I believe a great many, but certainly without further effect than the temporary cleaning of them.

2091. There is a large cesspool just outside?—Yes.

2092. Have you been at Chatham when it has been cleaned out?—Never when the cesspool was opened.

2093. With regard to the interior of the building, how often do you lime-wash it?—It is lime-washed every spring.

2094. And painted?—No. The painting is done once every eight or nine years.

2095. Is that sufficiently often?—I should think not. I, not long since, requested to have the cupboards and the woodwork of the wards painted, but my requisition on that point was refused on the ground that the regulated period had not elapsed.

2096. It is almost denuded of paint, and the woodwork looks brown and dirty?—Very much so. I first represented to the commandant the state of the hospitals and requested to have them painted. My application was forwarded by the commandant to the

colonel of engineers, and his answer was, that the period had not arrived. When that answer from the colonel of engineers was forwarded to me through the commandant, I addressed Dr. Andrew Smith on the subject, and he wrote me back to say that if I had any difficulty (he quite agreed with me as to the propriety of painting) in having it accomplished, I should then refer to him. With a copy of that letter I again addressed the commandant respecting the painting; my application was again forwarded to the engineer, who, I suppose, submitted it with an estimate of the expense to the Secretary-of-State for War, because the answer that I got was that the expense would be so and so, and that there were no funds.

2097. Was the expense very large?—415*l.*, I think.

2098. Is it your impression that the mode of doing those things is far more expensive than if it was done by contract?—Very much more expensive than if it was done by contract.

2099. Could you make a contract in Chatham, and would they do it for less there?—I heard a man say so; I heard him say that he thought that the job might be done for 140*l.*

2100. The job of whitewashing?—There was an instance the other day in which the engineer's estimate was 7*l.*, and I think it was done for 3*s.*, certainly under 10*s.* I make no doubt that if we could carry on repairs in that way, by contracts made by ourselves with parties in the town, everything would be done cheaper.

2101. You consider that painting is necessary for the health of the hospital as well as its appearance?—Yes.

2102. Now it has a very dirty appearance, has it not?—A very dirty and uncomfortable appearance.

2103. (*Sir James Clark.*) Do not you think that a dirty hospital has a bad moral effect on the patients?—Very much so, they look neglected.

2104. (*Mr. Martin.*) And that may lead them to neglect themselves?—I dare say it does.

2105. (*Mr. Stafford.*) Have you baths?—Every kind of baths.

2106. Are they sufficient?—Yes.

2107. Have you laundries?—We have a laundry, with every thing that is necessary in it.

2108. (*Sir H. K. Storks.*) Do the orderlies sleep in the wards?—Yes, the orderly on duty sleeps in the ward; we have a spare room for the others.

2109. You stated, did you not, that the wards were calculated for 24 men, and three orderlies?—Yes.

2110. Do they sleep in the ward?—Not now, I have been able to arrange differently, not being pressed for room; the orderlies not on duty sleep out of the room.

2111. (*Mr. Alexander.*) Are the water-closets adjoining your wards, at Fort Pitt, in a good state?—They are badly contrived, and not in good order.

2112. (*President.*) Are those hospitals of very modern construction?—None of them; they are old.

2113. The one at Brompton is more modern, is it not, than the one at Fort Pitt?—They are all the same: the buildings, I think, were never intended for the purpose.

2114. The upper one at Brompton is modern, is it not?—I do not believe it was a hospital, originally; the little building at the back was, but that is a very small portion of the hospital.

2115. Is it not necessary for hospitals to have stone stairs for safety?—Most assuredly, and I have already represented that subject.

2116. Have you stone stairs to that hospital?—Yes; but they are ineffective, because it is a wooden landing; in the main building, where I suppose 200 men are accommodated, it is all wood.

2117. (*Dr. Andrew Smith.*) Have you frequently, during the time that you have been principal medical officer at Chatham, asked for repairs to be done which were not accomplished?—I think that almost all the large repairs have been refused, and all the small ones accomplished.

2118. (*President.*) Very frequently now the engineer when he is called in employs contract labour in Chatham?—Always as far as I know. They had some time since to introduce a warming apparatus into the lunatic hospital, and that was done by contract; it was not done by the engineers themselves.

2119. (*Dr. Andrew Smith.*) On what ground were the alterations refused, on the ground of expense, or their not being considered necessary?—Generally on the ground of expense, I think.

2120. (*President.*) Supposing the thing is done by the engineers, though it is done more expensively, is it done as quickly?—No, it is not.

2121. There are some of those water-closets which are closed at the Brompton hospital marked for repair; when is it expected that they will be fit to use?—From the time of their being out of repair to the time of their being put in repair would probably be a fortnight or three weeks. If it had been in the hands of the purveyor, he would have sent for men in the morning and have had them done before the evening.

2122. (*Mr. Alexander.*) Can no slight leakage be repaired without going to the barrack department?—No, nothing can be done.

2123. (*Mr. Stafford.*) Have the men shelves over their beds?—They have a bedside table.

2124. Are there no shelves?—No.

2125. Does that bed-table contain the medicines?—There are shelves over the mantel-piece where the medicine is put.

2126. Where are the tins kept?—In a cupboard in the ward.

2127. Not over each bed?—No.

2128. Is that a better plan?—Yes, I think that the patient's bed should be as clear as possible; they are incumbrances: it is the business of the orderly to bring everything that the man requires.

2129. (*President.*) Of what material are the chamber utensils made?—Pewter.

2130. Is that as good as crockery?—I think not, it creates more smell and impurity.

2131. Are the men's effects, including blacking brushes, placed under the beds?—The packs are in the pack store; the blacking brushes in the wards with the men.

2132. Ought there not to be some place where those things should be stowed?—Yes, but I think that the system which is about to be introduced will do away with the blacking brushes.

2133. The meat that is ordered for the usual dinner is procured the day before?—The order is sent in the day before.

2134. The extras are always procured the day they are ordered, are they not?—Yes, and there is considerable delay in consequence.

2135. The materials for beef-tea are got the day they are ordered?—Yes.

2136. If you wanted to give beef-tea in the morning to a man who was sinking for want of nourishment, could you give it to him?—Not according to the regulations, because the extras are obtained after the diets of the day are made up, and it would be half past 10 or 11, or later, if the hospital is very full, and those things have to be sent for from the town at a very considerable distance.

2137. (*Sir H. K. Storks.*) Have you not preserved soups or meats in the purveyor's stores?—I dare say he has them, but we should not think of using preserved things.

2138. Why not, if you wanted them?—We do not want them, we want fresh.

2139. (*President.*) In the naval hospital they keep from the supper and the dinner of the day before a reserve for making beef-tea the following morning, do they not?—Yes.

2140. Might not that be done in the army hospital?—I think it might; it often happens, now I think of it, that there may be a little meat over, which they would not send back if the weather would permit it; but I spoke of chicken broth or a little fish that you might want.

J. R. Taylor.

E. q., C.B.

22 May 1857.

*J. R. Taylor,
Esq., C.B.*

22 May 1857.

2141. As to chicken or meat, there ought to be, ought there not, a reserve to meet cases of that kind? I think so. I think it might be arranged; we are particularly inconveniently situated for anything of the kind. At Melville hospital they have only to send a few doors for anything that they want.

2142. Then they keep a reserve?—They keep a reserve of meat, not of fowl.

2143. But it would be no expense whatever?—Not the meat. I do not see why there should be any loss on fowl—very trifling.

2144. (*Mr. Alexander.*) Would not it be very advantageous if estimates were made out at the end of each year for the probable expenses of hospitals separately from those of the barracks?—That is the regulation now. I the other day sent in, not an estimate, but a statement of the various repairs and improvements that would be required in the several hospitals.

2145. (*President.*) To whom?—To the commandant—that is the new system.

2146. To whom does the commandant send it?—Direct to the quartermaster-general.

2147. Does it not get clubbed with the estimate for the barracks?—I do not know.

2148. You do not know whether, when the estimates are submitted to Parliament, the hospital estimates are voted separate from the barrack estimates?—No.

2149. Do you consider Melville hospital to be better calculated for those purposes, and the buildings more ample than the army hospital?—The building is very superior; it was built for a hospital, and is very much more adapted for the purpose; it is very well proportioned to the requirements of the men; and the number of patients is never excessive.

2150. And the amount of cubic feet given per man is very much larger, is it not?—Very much larger I should fancy from what I have seen.

2151. There are 3 feet between each bed?—Fully.

2152. And 12 feet between the beds at the foot?—Yes, and the wards are much nicer.

2153. And the beds are wider, are they not?—I think they are.

2154. Have they the same difficulties as to painting and cleaning them?—I fancy not; whatever the principal medical officer requires is immediately done by his own order, unless it is something of very great expense, he then has to get the sanction of the director-general of his department.

2155. Have they separate lavatories to each ward?—Yes, a small one.

2156. Is their kitchen superior to the other?—Everything is superior throughout.

2157. In supplies, accommodation, quality, and quantity, is it superior?—I should say not as to the diet. I think ours is as good as theirs.

2158. Except that they give alternate roast and boiled meat?—I think they are going to do it, they are having the fire-place altered for roasting.

2159. (*Sir James Clark.*) Are the same quantities given in both?—I think so, as nearly as possible.

2160. (*Sir H. K. Storks.*) Is the hospital at Fort Pitt well ventilated?—No, I think not, no ward can be well ventilated when it is so full.

2161. Are the casemates well ventilated?—No.

2162. (*Mr. Alexander.*) Are you aware that every November an estimate for the ensuing year is sent in by Mr. Drummond, and that he has the power of carrying it out?—Yes, I heard him say so.

2163. (*President.*) You saw the water-closets there were very good and sweet?—They were perfectly sweet, and they had mahogany seats.

2164. (*Mr. Alexander.*) There can be no comparison drawn between the hospital of the Marines, and the military hospital at Chatham?—None whatever.

2165. (*President.*) Did you see their dispensary?—Yes.

2166. It is beneficial to have a sort of dispensary where things can be had at night?—I think that the system is very good.

2167. (*Mr. Alexander.*) Is not the bed linen much better washed in the marine hospital than in the military hospital?—Yes, they do it themselves.

2168. By hired labour?—Yes.

2169. (*President.*) You do it, do you not, by sending it to the barrack department?—Yes, we only wash the personal linen in Fort Pitt.

2170. (*Mr. Alexander.*) Would it not be better if all the washing of the hospital was done in the laundry of that hospital under the purveyor?—No doubt it would be much better and cheaper.

2171. (*President.*) You have stated that you have fewer goods supplied, that you have not the same means of cleanliness, you have not supplied the same quantity, nor the same quality, as in the naval hospital?—I think that the diet is as good.

2172. But with regard to dry stores, furniture, crockery and glass, their supply is better and more ample than yours?—I think so; as to their being more ample, we could have as many as we required. The articles looked to me of a better description.

2173. With reference to cleaning and painting they have facilities which you have not got, as you are dependent upon another department, and they are not?—Yes.

2174. With regard to repairs, it is the same, is it not?—Yes.

2175. Do not you think that the general stinted and meagre appearance of the Chatham hospital, when a young medical officer comes down to it on joining the army, coming flush from the great establishments in London, must lead him to form a low estimate of the value attached to the health and comfort of the soldier?—I think that he would think the hospital very inferior to a civil hospital; I do not know that he would be impressed with the idea that the soldier was little cared for.

2176. Would it not lead to the impression that the authorities did not attach that importance to the medical treatment of the soldier that he requires?—I do not think that that would be exactly his impression, but that the government were not inclined to lay out money on it.

2177. That is what I mean?—I think that those who represent the country are very anxious that the soldier should have everything done for him that he could require.

2178. There is not the accommodation in the way of building that they ought to have?—No, nor does the furniture present the same comfortable appearance that the furniture in a civil hospital does.

2179. Neither does the contracted space give the same chance of health and recovery as the larger space, in a civil hospital?—I do not think that it does.

2180. As to the supply, would you put all that into the hands of your purveyor, as your remedy?—Yes, I should make him find everything, and perform all the repairs. I would make the hospital complete in itself, and between the medical officer and the purveyor everything should be done.

2181. You would expect the purveyor as to diet to obey implicitly the orders of the principal medical officer?—Yes.

2182. With regard to furniture, you would expect him to produce for each patient everything necessary for him, without going through the ceremony of making a requisition for every article?—I should explain that he does now do it; he has a store which he obtains from the barrack-master on requisition.

2183. Do not you make a requisition on him for the things that are wanted?—No; there is a supply in each ward, each bed is furnished, and the orderly in charge of the ward, and the ward-master, are responsible.

2184. In war, would it be for the principal medical officer to make requisitions for all the things?—Yes.

2185. Would it not be better, that the principal medical officer should merely have to say, I have so many patients expected, and you must provide for them?—I think that in war the principal medical

officer should be independent, and be able to order such and such things to be produced.

2186. Ought there not to be certain things to be produced, as a matter of course, without any command?—Certainly, if a hospital is to be established for so many patients, it follows that a certain number of things would be necessary in proportion to each patient. If I tell the purveyor to provide a ward for so many patients, I suppose that he understands that he must have so many blankets, sheets, and utensils of all kinds.

2187. Why do you think that he would do it better than the barrack department?—Because it would be his chief business; he would be responsible that it was done. If I go to the barrack officer it is probably a secondary business with him, and therefore he is not so fully responsible or interested in it.

2188. Would you allow him to make contracts?—Yes.

2189. You would make him the purchaser of the supplies as well as the issuer?—Yes.

2190. And the storekeeper?—Yes.

2191. Whom would you put them under in the ward?—Under the ward-master.

2192. He is the proper person, you think, to be responsible?—Yes.

2193. Is he responsible for the cleanliness of the ward now?—Yes.

2194. But he is responsible under the purveyor, is he not?—Yes.

2195. Is it supposed to be the purveyor's duty?—Yes it is; with me it is merely nominally so. Mr. Pratt is not exactly the purveyor of the hospital; he has a large district to attend to, and his business at Fort Pitt is secondary with him; it should be his first business.

2196. Do you think, instead of its being done by the purveyor, it could be done by the commissariat?—I think the purveying might be a branch of the commissariat.

2197. You would not make the commissariat indiscriminately supply the army in the front during war and the hospital besides?—Certainly not.

2198. Why?—Because then it would become a secondary duty, diminishing the efficiency of the service; if the same man has to supply my hospital with bread and meat who has to supply the effectives of the division, the two duties will sometimes clash; there might be deficient means of carriage or deficient meat or bread, and then the hospitals are neglected.

2199. At present the purveyor can, can he not, at Chatham, supply the hospitals with bread and meat?—Yes.

2200. He has always the power, has he not, of supplying the hospital, even where the commissariat would usually do it if he thinks that he can get a better quality by giving an additional price?—I think so.

2201. You say if the commissariat did it, you think they would consider the supply of the hospitals as a secondary duty?—Yes, I have always found that that is practically the case, that when you go to war you meet with difficulties, and then the main duty is to keep the effectives well supplied in front, and the hospitals are supplied *if possible*.

2202. You have served in India, and besides that in the Burmese war?—Yes, and in America.

2203. Have you ever been in the field in India?—Twice, in the Sutlej campaign, and in Burmah.

2204. In the Sutlej campaign did you find that which you mention now, that the hospitals were less well served than the troops?—The duties were found to clash, and the hospitals were consequently neglected, and Lord Hardinge, seeing that, appointed an officer specially to the hospitals at Ferozepore.

2205. As a separate duty?—Yes; as a separate duty to supply the hospitals, and not only that, but every day he had to visit every hospital and see the medical officer, and to inquire whether he had everything he wanted, and then it answered well, because it was that officer's first duty, but where it is his second duty he neglects it.

2206. The commissariat in India is much better than ours, is it not?—I should say decidedly not. I never found it so.

2207. It is composed of military officers, is it not?—Yes, of men taken from the regiments as young men.

2208. (*Mr. Martin.*) Are you aware, that recently, by an order of Lord Dalhousie, a year's probationary course beginning and ending with examinations is required from all?—I was aware that he was making great improvements in the commissariat department, because it had been found deficient.

2209. A probationer is first received after having passed his examination in languages; he is then placed for six month's in the office of the commissariat at the presidency; then six months more in the office of the auditor-general of commissariat accounts, ending with an examination before a board of officers, extending over three days; were you aware of that?—It was not so while I was in India; I left in 1854.

2210. (*President.*) Is there not this defect in that commissariat system, that an officer who is taken from a regiment goes back to it on promotion?—He did, when he got his regimental majority.

2211. Then you lost to the commissariat service all the experience that he had gained in the commissariat business, and he came back to the regiment having lost his regimental knowledge?—That was the objection.

2212. Has that been remedied?—They make them permanent now, I believe. I never found that the commissariat in India supplied the hospitals more efficiently than our commissariat, quite the reverse; I had incessant complaints; I mean, that things were never sent up until they could conveniently do it. "If possible" was always the answer to the hospital; but they knew very well that they must have the soldiers' rations and rum up, and it was "must;" they were obliged to do so; therefore I wrote to Dr. Smith, pointing out that it should be somebody's first duty to supply the hospitals.

2213. (*Mr. Martin.*) What was your opinion as to the value of the subordinate medical department in the Indian army?—It was very valuable indeed, they could not get on without them, I think it was a most excellent establishment.

2214. Should you think that the introduction of such a department into Her Majesty's army at home and abroad would be a great improvement?—I do not think that there is sufficient sickness or sufficient strength in our colonies to require that assistance.

2215. Not in the West Indies?—I am not certain.

2216. You are aware that the subordinate medical department in India consists of two warrant officers, the one an apothecary, and the other representing the commissariat of the hospital, viz., the steward or the assistant?—He represents the purveyor or rather the steward, certainly not the commissariat, because he can supply nothing.

2217. He renders his account to the commissariat officer of the division?—Yes, but he is a mere steward, he has no power to get anything.

2218. But he dispenses what is given to him, the other represents the medical stores, compounding and administering the medicine in the hospital, he is the apothecary or assistant apothecary; do you consider him also very valuable?—Very much so.

2219. Both of them keep their own accounts so as to save the surgeon?—Yes; I do not think that a regiment anywhere else, I cannot speak for the West Indies, but nowhere else would a regiment require an apothecary or a steward.

2220. (*Mr. Alexander.*) Is not a dispenser necessary for a regiment?—No.

2221. Who should dispense?—I think that the responsibility rests with the medical officer. I should not object to his employing an intelligent non-commissioned officer to make up medicines under him.

2222. Would it not be better if there were regularly established rules to that effect?—Yes.

*J. R. Taylor,
Esq., C.B.*

22 May 1857.

*J. R. Taylor,
Esq., C.B.*

22 May 1857.

2223. Have you not men in training now at Chatham?—Yes, there is the medical staff corps in training.

2224. Do not you think that the present hospital serjeants could act as dispensers, and be held responsible for that duty?—I think that the responsibility should rest with the medical officer, but that there should be no regulation preventing him from employing those men under him.

2225. (*Mr. Martin.*) On actual service, even in Europe, would not such a department as the subordinate medical one in India be extremely valuable?—In such an emergency as that which occurred in the Crimea, it would.

2226. Would they not be as efficient in war as in peace in the regimental hospitals?—Yes.

2227. (*Mr. Stafford.*) How many medical officers have you under you at Chatham?—The number varies every day; I think I have fewer than ever now, somewhere about eighteen for all the hospitals.

2228. What ranks are they?—They are staff surgeons of the first class. I have two of that class and six staff surgeons of the second class; there are five staff assistant surgeons, and two acting assistant surgeons.

2229. What are the acting assistant surgeons?—Assistants without a permanent appointment. Probationers.

2230. (*President.*) How long do those probationers stay generally, now?—It is almost impossible to average the time, it is so uncertain.

2231. What is the longest of the attendances?—Some that went to China had been there nearly a year and a half, sometimes they are there a very short time.

2232. (*Mr. Martin.*) The longer they remain, you think, the better for the public service?—I should send a man at once to a regiment myself, but that is a matter of opinion. I look upon a regiment as an excellent school.

2233. (*Mr. Stafford.*) What amount of supervision have you over those young men?—There is a staff surgeon of the first class in charge of each division, and he has to superintend the officers junior to him in each division.

2234. Has he any control over them except during the time that they are in the hospital?—No.

2235. Do they all lodge in the town?—No, some of them lodge in the fort and some in the town.

2236. How frequently do you report to the chief medical officer?—I send a confidential report to Dr. Andrew Smith every month concerning the junior officers.

2237. How often concerning the senior officers?—Once a year.

2238. (*President.*) Do you give them any special instruction except what they could get from their own observations?—Yes; they perform operations under the curator of the museum and the staff surgeon of the division whenever there is a post mortem examination.

2239. Do they get any clinical instruction?—There are no clinical lectures given; there is an operation room which is very well adapted for the purpose.

2240. (*Mr. Martin.*) Have they any instruction in sanitary science?—No.

2241. (*Dr. Andrew Smith.*) From what sources do you acquire knowledge to enable you to report fairly to me in regard to the qualifications of candidates and their efficiency for the duties of army medical officers?—I obtain my information from my own observation; from reports which are required of the staff surgeon of the first class in charge of the division, and also from the ward report, sent to me by each junior officer; I gather from that some knowledge of him.

2242. You also examine their registers?—Yes.

2243. What instruction do the candidates at Chatham receive while stationed there; first, as to post mortem examinations?—They are required to attend every post mortem examination, and if the body examined is that of a patient who died in their

ward, they are called upon to make up an abstract of the case which is read out before the post mortem examination is made, and that abstract includes their diagnosis of the disease; the post mortem examination is then made.

2244. (*Sir James Clark.*) What class of officers do you allude to now?—The junior officers, the assistant-surgeons.

2245. The man who treated the patient?—Yes, under the superintendence of the staff surgeon; the staff surgeon is the responsible man.

2246. But he allows the probationer to keep the patient under his direction?—Yes. The probationer writes in the register and prescribes in ordinary cases so far as the staff surgeon of the division chooses to trust him.

2247. Do you think that a very useful kind of instruction for a probationer?—Very much so.

2248. How long do you think he should have the advantage of such instruction before he goes into the army?—I myself should be inclined to send a man to a regiment at once, as in a shorter time he learns the art of dealing with soldiers and their habits better than at Chatham.

2249. (*Mr. Alexander.*) Has he not at Chatham an opportunity of practising operative surgery, and studying the stethoscope?—Yes; but those are the points that I do not suppose they need instruction upon so much; they are just fresh from school.

2250. (*Mr. Martin.*) You are aware that in India every assistant surgeon is required to serve three months as a probationer at the general European hospital at each presidency?—I think that is the nominal rule, but I do not think it is carried out. When I was in the country, I think they came straight up the country with recruits.

2251. Referring to a former reply of yours, do you think, generally speaking, that the soldier feels satisfied that ample hospital provision is made for him by the government?—I think he is quite satisfied, but I do not think that he is a judge.

2252. (*Dr. Andrew Smith.*) What instructions are given in reference to operative surgery on the dead body? Will you mention, in succession, the different processes that take place?—A notice is given always of every post mortem examination that is about to be made, and every medical officer is required to attend, particularly the junior officers; the officer who has had charge of the patient writes out an abstract of the case and his diagnosis, and the post mortem examination is then made. The officer making the post mortem examination, who is the officer who has had the main charge of the case, describes the morbid appearances as he goes on, regularly going through the different regions, and another officer writes it down; it is afterwards entered in the neurological register; after the post mortem examination is finished, under the superintendence of the curator or the staff surgeon in charge of the division, the operations are either shewn to the junior officers, or they perform them under the guidance of the staff surgeon of the division or the curator. I do not recollect anything else.

2253. Is there any teaching with reference to the application of bandages, splints, and such like things?—Yes, every officer is required to be *au fait* at that.

2254. Is there not a stuffed figure there for that purpose, for the use of those who cannot have an opportunity of applying them on patients?—Yes, there is.

2255. In order that they should be accustomed to the application of bandages and splints?—Yes.

2256. What is the ordinary routine duty of a junior officer while he is an orderly officer?—An orderly officer has so many duties that I can hardly remember them at once; but he is responsible for the whole management of the hospital during the time that he is on duty, and, supposing the other officers absent; he has to visit the wards frequently during the day; he has to visit them always at every meal, and see that the meals are properly served and conducted; he has

to attend to every complaint that a soldier may make as to his meals, he has to see that the orderlies are properly attending upon the patients, and that they are present at certain hours; he has to see any patient who may be taken ill, and to answer all emergencies; he has to see patients brought in at all times; he has also to enter the admission of those patients in a book; he has also to witness anything given over by those patients in charge to the ward-master, and he has innumerable duties of that kind to perform.

2257. Are any steps taken to instruct candidates arriving in those duties before you send them to do the duties?—He is put on as a supernumerary if he is a new hand.

2258. For what purpose?—To learn the duties before he is allowed to be an orderly officer.

2259. (*Mr. Alexander.*) Would it not be beneficial if so many months' leave were given to each officer for every year he had served abroad, making it imperative upon him to attend a course of lectures at some school during that period?—I think it would be a great advantage that he should have an opportunity of renewing his acquaintance with science. I think it necessary.

2260. Would not many officers take advantage of it to improve themselves in a knowledge of their profession?—I think they would.

2261. If a roster were established, and carried out with that object, officers would have more chance than now for improving themselves?—Yes, they would.

2262. If certain periods of service were laid down for certain stations abroad, after which they might return on being relieved?—I think that they ought to be relieved, after a certain interval, and brought home and placed in situations in which they might improve themselves.

2263. Suppose an officer abroad for four years; if he came home and he was entitled to two months' leave for every year that he had been abroad, that would give him eight months' leave of absence, during which he could go to some school for a certain period, would you make him attend some school?—Yes, I think that the principle is admirable.

2264. Supposing that at Netley hospital three first-rate men were appointed to lecture, having charge of the medical and surgical wards, one appointed to give a clinical course, another to lecture on surgical cases, and another upon pathology; also to lecture on morbid anatomy, the practice of operative surgery, and on military hygiene, would not much advantage be derived from that to the profession and to the officers receiving that instruction?—I think so.

2265. Those three officers should be permanent, do not you think, in order that they might get into the habit of teaching?—I am not sure that I would recommend them to be permanent. I think that officers abroad acquire information that it would be very desirable they should give to others when they come home.

2266. (*Dr. Andrew Smith.*) If they were permanent, would it not happen that a man when he got near to the head of his grade would want to get away to get promotion?—If he could not retain his appointment with promotion.

2267. (*Mr. Martin.*) Do not you think that medical officers who come home on sick leave should have similar advantages to those which Mr. Alexander has stated on the recovery of their health, and that a certain time should be allowed to them to study in the civil hospitals?—I think that if they come home on account of sick leave they should have their sick leave.

2268. And after that they should have the facilities afforded to them?—I think that that should be a separate consideration on other grounds.

2269. (*Sir H. K. Storks.*) Is it desirable that an assistant-surgeon should be required to pass a second examination before he is promoted?—That used to be the rule, I believe, but it was dropped, I fancy, because it was not found practicable.

2270. (*Mr. Alexander.*) There are some difficulties in carrying it out, are there not?—I think so; I think it would be very objectionable, it would make the department unpopular, especially where a man has taken his diploma, or one or two from different colleges.

2271. (*President.*) They do that in the navy, do they not?—I think that the navy is not much liked as a service.

2272. Are there not other reasons for not liking it?—Yes.

2273. Among the medical officers, is it not the rule of the navy?—I recollect some years ago when I was in the schools having some assistant-surgeons of the navy brought to me by Mr. Guthrie to work up for the college examination for their promotion, and their feelings on the point were very unpleasant.

2274. Did you ever know anybody who, on going up for an examination, did not think it would be a good thing to dispense with it?—Not if a man acquires honour by it.

2275. The great inconvenience in the army service would be, would it not, that officers are so often abroad that it would be difficult to afford them the opportunities for preparing for such examination?—There would be difficulties, and I do not see how you could establish an examination.

2276. If there was leave of absence by roster, would not that facilitate it?—Yes, it would bring them before a body to be examined, less unpleasant to their feelings; formerly an old assistant-surgeon might be brought up for examination, and one or two of the examiners be junior to himself.

2277. (*Sir H. K. Storks.*) Suppose these officers were promoted abroad, subject to passing an examination on their return home, would not that obviate the difficulty?—I should doubt the utility of the examination.

2278. (*President.*) Would it not be useful even, supposing it not necessary in order to establish his fitness for the rank of surgeon, and would it not in a young man correct the tendency to that idleness which the liberty of his position engenders, when he first joins his regiment?—It would with some, but not generally.

2279. Do not you think, with the mass of mankind, the prospect of examination is the corrective of idleness?—I do not think it is.

2280. (*Sir H. K. Storks.*) Would it not induce a young assistant-surgeon to work?—I do not think it would. You will find, when pupils are preparing for their examination, if they are inclined to be idle they will be idle, until about six months before.

2281. (*President.*) Is it not found at the universities that the only way of insuring discipline and attention to study, is by having frequent examinations?—I think with a young man of that description it would answer very well, but with assistant-surgeons, who in peace times would be oldish men, it would be very unpopular.

2282. They need not pass their examination when they are old men?—I think that in an interview with the director general, he could tell at once what they were made of without examining them; the director general has received reports of them, and he knows what the men are.

2283. That is, as regards their fitness for the rank of surgeon; but as to their tendency to idleness, how would it be?—I think that the one includes the other. I should say that the director general, from the reports which he receives, could always nearly tell whether a man was an idle man or a working man.

2284. But as they are promoted by seniority, what object is there in it?—They are not promoted by seniority; at least, I know of no rule; it may be seniority in the service, or seniority in the grade, or seniority in the station, or neither one nor the other.

2285. Are they not selected, one man over the head of another, for superior attainments?—I do not

*J. R. Taylor,
Esq., C.B.*

22 May 1857.

J. R. Taylor,
Esq., C.B.

22 May 1857.

know; but indeed, I should say that they were; I have no means of judging of that.

2286. (*Dr. Andrew Smith.*) Could it be laid down safely, as a rule, that you should select for promotion instead of taking by seniority?—I do not think that the plan of selection would satisfy men; they would never be satisfied, for they could not always know why one man was selected over another.

2287. (*President.*) You think that they are not promoted by seniority now?—There is no strict rule.

2288. Are they satisfied with it?—I think that they could not complain of the seniority principle.

2289. (*Sir H. K. Storks.*) Are they satisfied with the present system of promotion?—No, not a man.

2290. (*President.*) Why do you think seniority is fair; is it fair to take a diligent and able man no sooner than an idle and a stupid one?—The subject of promotion, I admit, is a very difficult one; it is fair to the individual.

2291. You think it would not be fair to the service?—I do not think it is; but you may correct that as they do in India, and select a man. If an army is going into the field the governor-general will select a man, and he may or may not take the senior for the charge of the army; but then, although they cannot in the Indian army deviate from the rule of seniority, yet the governor-general can always reward a man by collateral advantages; he can give him a civil station.

2292. (*Mr. Martin.*) Are you aware that in civil life young surgeons do keep up a course of study with a view to pass as fellows of the college of surgeons, and that they do that up to the age of 36 or 40?—I do not know whether they keep up a course of study.

2293. They must necessarily do that in order to pass an examination?—I think that a man who is constantly in London has no difficulty in keeping up his information for such an examination as that. I look upon it that examination before promotion has been found to fail and has been given up.

2294. (*President.*) Do not you think that public feeling has altered very much; it is done in the college of surgeons for example?—That is not quite an analogous case. A man goes through that examination for additional professional honours; here, he acquires no additional professional honours.

2295. Yes, he acquires the rank of surgeon?—He gets the military rank; and that military rank at present is nothing at all, it is no acquisition.

2296. (*Sir H. K. Storks.*) It is an acquisition in point of pay, is it not?—I have been promoted without any increase of pay.

2297. (*Sir James Clark.*) Have the probationers at Chatham any means of practising dissection of a body?—Yes, they may dissect and operate there perhaps more than at any other school.

2298. (*President.*) Is that from the number of invalids?—Yes, cases from all parts of the world.

2299. You do not think that in a general hospital the fact of its being confined to invaliding cases would make that less applicable?—No.

2300. Have you women and children there?—Very few in hospital; there are a good number in the garrison.

2301. (*Sir H. K. Storks.*) You do not admit them into the hospital, do you?—No.

2302. (*Mr. Stafford.*) Are they in the casemates?—Yes, there is a ward there for the reception of women and children.

2303. (*President.*) It is a very foul place, is it not?—Very wretched.

2304. They are not like the casemates just below Fort Pitt, which are lighted at both ends?—There is a window at both ends.

2305. At St. Mary's, is there?—No, there are two windows there.

2306. One on each side of the door?—It is at the door end; at the other end there is a fire-place, and a little window at each side.

2307. How are they admitted there?—This is a charity; it is a mixture, partly charitable and partly

government. Government pay for the dieting of the infectious cases, because it is agreed that those cases should not remain in the barracks. Women and children of soldiers married with leave and staying in the barracks who get an attack of the measles or small pox are admitted into this ward.

2308. If a woman contracts any infectious disease, she gets dieted and treated by the government?—She does.

2309. But if it was not an infectious case, she would not?—No; but then if it is a proper case the charity would pay the expense.

2310. (*Mr. Stafford.*) What charity do you refer to?—It is a subscription among the officers and soldiers.

2311. (*President.*) A woman that has not an infectious disease would be treated in the barrack room?—Yes, they come to the hospital for medicine.

2312. Is not that a very unfit thing?—Yes, no doubt many cases remain in the barracks in that way that should not, but they will conceal it as well as they can in order that they may not be turned out.

2313. (*Mr. Stafford.*) Can you give the dimensions of one of those casemates at St. Mary's?—No.

2314. (*President.*) They are very small, are they not?—Very small.

2315. (*Mr. Stafford.*) Could you furnish the Committee with the dimensions?—Yes.

[Description of the rooms at St. Mary's Barracks. Invalid Depôt.

These rooms are casemates of two stories, the upper ones being arched, with a verandah running along the floor of the upper story. The size of the lower rooms are—

Length, 61 feet 6 in.

Breadth, 17 feet.

Height, 10 feet 5 in.

Cubic space, 10,900 feet.

Light is admitted in front by a window on each side of the door, and one above it.

Ventilation, by means of the windows above described, and by three ventilating windows on each side of the walls, running through the whole length of the basement, and at the back by a fire-place with a ventilator near the roof.

Upper Story.

Length, 60 feet 6 in.

Breadth, 17 feet.

Height from floor to base of arch, 3 feet.

Cubic space, 8,400 cubic feet.

Light, in front by a window on each side of the door, and one above it; at the back by two deep-seated small windows, the walls being very thick, and roof is bomb-proof.

Ventilation, by means of the windows (which all open), as above described. A fire-place at the other extremity, as also a ventilator near the roof.

Each of these rooms contains 24 beds, these being 27 inches broad, and 6 feet 3 inches long, the space between each averaging 24 inches; but in the rooms appropriated to the maimed this space is rather smaller, although there are two beds less; this is owing to the space parted off for the married.

H. HUISE, M.D.,

In Medical charge. Staff Surgeon, 2nd Class.
St. Mary's Invalid Depôt,
May 25th, 1857.]

2316. (*Dr. Andrew Smith.*) You are permitted to take into the female hospital a number of women and children not labouring under infectious diseases, are you not?—Yes, but the government do not pay for them, and the charity would object unless it is a case of necessity.

2317. You are also permitted, are you not, to take in women for parturition?—Yes, the charity pays for them.

2318. Have you not received a letter from me with reference to the government granting a large sum of money?—No; I represented the other day the neces-

sity of the government paying the expenses of those women.

2319. (*Sir James Clark.*) Would it not be a great advantage if all medical men entering the army were to pass a certain time at such a hospital as Mr. Alexander described before they became regimental assistant-surgeons?—Yes, it would be an advantage; but I must say that to make a military medical officer there is no place like his regiment.

2320. (*President.*) Would you always appoint a probationer to a regiment rather than to the staff?—I think I would.

2321. (*Mr. Martin.*) In preference to such a probationary course as Mr. Alexander has indicated?—Under those circumstances I think it would be a matter of indifference. I think as he is fresh from the schools he requires no more school knowledge. He wants then to acquire a knowledge of soldiers and of military discipline.

2322. (*Sir H. K. Storks.*) Would he not acquire better knowledge in a general military hospital than in a small regimental hospital?—Yes; his professional knowledge; with the regiment however he would improve his ability as a military medical officer.

2323. Do you think that the sort of life that a young man leads in a regiment, as assistant-surgeon among the young men of the regiment, is a good one?—Regiments differ very much in that respect, it might or might not be so. I think as regards moral conduct, perhaps, a regiment may be fully as good as a hospital. Place a parcel of young medical officers together, and they are just as wild as officers generally.

2324. (*Dr. Andrew Smith.*) Suppose a young man enters into the service and he is appointed to a regiment, and three days afterwards a detachment of 300 men is ordered off, would he be sent away with that detachment, totally unacquainted with the routine duties, and how would he obtain that knowledge?—I would not send him with a detachment until he had been a certain time with the regiment.

2325. (*Mr. Martin.*) Has it not been held by great army surgeons that such a probationary course is necessary before entering on the duties of an army medical officer, and did not Mr. John Bell, on seeing the condition of the wounded at Great Yarmouth, after the battle of Camperdown, come to the same conclusion?—My opinion is, that the best school in which to make a man a military medical officer is a regiment.

2326. (*President.*) Ought he not to have some theoretical instruction upon things that he may never see in his life; for instance, in a very healthy climate, how could he study tropical diseases, and ought he not to have some general instruction upon these diseases?—I imagine him to have had that before he gets his commission. If you reserve that till afterwards, that alters the thing.

2327. (*Mr. Martin.*) Hygiene is nowhere taught in the civil schools in this country, is it?—I suppose a man to get his commission when his knowledge, medically speaking, is complete; and for the rest I say the regiment is the place.

2328. Did not the historian of the Duke of Wellington's campaigns complain that in consequence of the absence of preparatory instruction, shoals of assistant-surgeons were sent out whom he described as "ignorant of war and of their own profession"?—They were not assistant-surgeons, that was the thing.

2329. Meaning by "ignorant of war" that they were ignorant of those military instructions which he considered preliminary to entering upon the duties of an army medical officer?—From what I heard Mr. Guthrie say, they were not assistant-surgeons at all, they were without civil diplomas.

2330. (*President.*) Is there not a great deal of sanitary knowledge required in an army medical officer which is not required in a civil medical officer?—I think it is equally required in a civil practitioner, but

he has not the same constant necessity for the application of it.

2331. He has to form hospitals, has he not?—Yes.

2332. He may be consulted on the questions of health or of encampments?—Yes.

2333. And upon the question of the wholesomeness of the rations?—Yes.

2334. Ought he not to have received some instruction upon those things?—Yes, I imagine every medical officer to have that; he cannot have learnt physiology without it.

2335. Is there not a great deal of speciality in the army medical service?—Sanitation has become a separate science; it has been in some measure taken out of the hands of medical men.

2336. Ought it not to be brought back to the medical men in the army?—I think it ought to be left to them.

2337. (*Mr. Martin.*) Is not the influence of external causes in producing a disease a very abstruse and difficult subject?—Yes, but I think that every medical man has to study it.

2338. You are aware that the mortality in the navy from having been at one time upwards of 7 per cent. per annum is now reduced to under 2 per cent. per annum?—I am aware that there is an immense reduction.

2339. Do you apprehend that that great saving of life has been brought about by any improvement in medicine and surgery, or has it not been rather the result of the application of sanitary regulations?—Yes, as introduced by the medical men of the navy, who had no instruction in sanitation further than they all obtain in learning physiology.

2340. Did they not acquire that knowledge in the navy originally at the expense of the seamen's health?—Of course they did; every experience costs something.

2341. Do you think that the medical officers are sufficiently consulted at present by the commanding officers on sanitary points?—I do not.

2342. Are they consulted at all?—They are consulted when it is convenient.

2343. (*Mr. Stafford.*) Are their suggestions disregarded?—Very often.

2344. (*President.*) In a hot climate if a commanding officer selected an hour of the day for his parades that would be detrimental to the health of the men, would the medical officer think himself justified in interfering with the orders upon the subject, or would it be his duty to do so?—The medical officer would not know exactly how he stood, but he would as a matter of course go to the commanding officer and give his opinion, and the commanding officer might say, if he was in that humour, "When your opinion is wanted, you will be asked for it."

2345. (*Sir H. K. Storks.*) Did you ever make such a recommendation and receive such an answer?—Yes; not in those words but equivalent to them.

2346. (*President.*) The medical officer would be guided a good deal by his knowledge of the character of the commanding officer?—There are certain commanding officers that a medical officer would not go near at all; he would be deterred; he would not submit to insult.

2347. It is not a matter of regulation?—No, the medical officer does not know how far he is to take the initiative, nor does the regulation say how far the commanding officer is to listen to him.

2348. There is no regulation that the combatant officer should ask the opinion of the medical man, and there is no regulation that the medical man should offer an opinion?—The medical officer does not know how he is placed.

2349. Upon that point there is no regulation?—No.

2350. (*Sir H. K. Storks.*) Do you think it is the practice for medical officers to be insulted by their commanding officer?—No, it is not the practice.

J. R. Taylor,
Esq., C.B.

22 May 1857.

J. R. Taylor,
Esq., C.B.

22 May 1857.

2351. Is it within your knowledge that that has often occurred?—Not so far as insulting goes. He is told what is equivalent to it, "When your opinion is wanted, you will be asked for it," if not in those words.

2352. You used the word "insult"?—I should say if a man's opinion is disregarded in a curt manner, it is an insult, and you do not like to put yourself in the way of it.

2353. (*President.*) You were in the Burmese war, were you not?—Yes.

2354. At that time there was great mortality, in consequence of the troops being fed upon salt meat when they could have been supplied with fresh meat?—Yes.

2355. Did the medical officer make any remonstrances upon that subject?—I did myself, several, and I have them here; but notwithstanding my remonstrances the salt meat was continued.

2356. Was it possible to get fresh?—Yes, at one sixth of the price.

2357. Upon what ground was it refused?—The ground was not stated to me, but I understood that the general commanding considered that, as the sailors lived upon salt meat, he did not see why the soldiers should not do the same.

2358. (*Sir H. K. Storks.*) Who was the general commanding?—General Godwin. My report was published, under the sanction of Lord Dalhousie, by a medical officer who was then his own medical attendant; therefore, I imagine what is put down here will be received as true. This is a letter that I wrote with reference to sanitation, dated Rangoon, April 20th 1852, addressed to the adjutant of my regiment. The medical officer cannot go to his commanding officer, he must go to the adjutant. Upon such a point, I think the medical officer should be entitled to go to his commanding officer.

2359. Where do you find that laid down?—The commanding officer laid it down.

2360. What regiment are you referring to?—The 80th.

2361. Was that a standing order of the 80th Regiment?—You could not act otherwise.

2362. There is nothing in Her Majesty's regulations to that effect?—In my former regiment, the 29th, I could go to the commanding officer.

2363. Why could you not go to the commanding officer in the 80th?—The commanding officer chose to act otherwise, and the practice was established.

2364. (*Dr. Andrew Smith.*) Have you ever addressed a letter to your commanding officer, and received an answer from the adjutant, instead of from him?—Yes; you never receive an answer direct from the commanding officer.

2365. (*Sir H. K. Storks.*) Do you mean that when you were surgeon of the 80th regiment, you could not make a personal communication to the commanding officer?—I might go to him; but, if I wrote a letter, I was told to address it to the adjutant. The letter which I wrote on the 20th of April was as follows:—"Sir, I request you will be good enough to bring to the special notice of the commanding officer the melancholy prevalence of bowel-complaints and of cholera in the regiment, and my observance amongst the men of symptoms threatening the introduction of the scorbutic type of dysentery, which occasioned so much sickness and mortality in the last Burmah war.—2. The evils here pointed out as existing, and to be anticipated, can, I am humbly of opinion, only be successfully met or obviated by placing the soldiers, without delay, upon a wholesome ration of fresh bread and meat, with vegetables, to the total abolition of the highly-objectionable ration of salt meat and biscuit, upon which the men have been exclusively fed since the 7th instant, notwithstanding the General Order, B.F.F., No. 2, Rangoon, 16th April 1852, placing troops and establishments, from that date, upon shore rations." That was the order, but they never got it; the commissariat had not it to give.—3. The salt rations, so unsuited to a hot climate, together with the constant expo-

sure of the men to excessive heat, night dews, crowding, and most unusual fatigues, appear to me fully to explain the prevailing sickness; and I beg most strongly to urge, for submission to the higher authorities, the immediate necessity of removing all the morbid agencies here mentioned." That refers to the salt meat.—4. I have also to request that my inability to procure bread, milk, eggs, and other similar articles forming the prevalent and prescribed items of diet for the sick hospital, may be brought to the notice of the authorities."

2366. (*President.*) Were those things procurable?—I could not obtain them.

2367. Could they have been bought?—The commissariat were not provided with them.

2368. (*Sir H. K. Storks.*) Was the shore ration procurable?—I do not know what facilities the commissariat had.

2369. What answer did you get to your letter?—The only answer that I got to that letter, I believe, was that there was nothing to be done.

2370. Was that answer verbally, or by writing?—Verbally, by the commanding officer.

2371. (*President.*) You stated that at that time fresh meat could have been procured at a sixth of the price?—Not just at that time. Subsequently, salt meat was continued when fresh could have been got.

2372. Did you continue your remonstrances at a later period?—Yes; I made two or three remonstrances afterwards. I entered in my report thus, and the report was sent home to Dr. Smith:—"The inhabitants having fled with all their property, fresh rations could not be supplied till the 23rd of April, or eleven days after the landing; so that as respects H. M.'s 80th regiment, the men had been on salt rations from the 20th of March to the 23rd of April, with the exception of the nine days at Moulmein. After the 23rd of April salt ration was continued twice a week, notwithstanding fresh meat was abundant and less expensive."

2373. Did you make representations at that period?—Constant representations; but I have no record of them, nor do I think that I ever got a written answer.

2374. With regard to the tents and the encampments, are the medical officers consulted as to the sites of the encampments, and the quality of the tents?—They may, or they may not; there is no rule about it; the commanding officer may do so.

2375. If a new barrack was being built, would the medical officer be consulted as to the site?—I am not aware that he would in this country; in India, there was an order that the medical officer should be consulted; that system was introduced by Lord Dalhousie.

2376. (*Dr. Andrew Smith.*) Were you ever asked by a commanding officer, when he intended to encamp, what your opinion was of the ground?—Yes, I have been asked.

2377. (*Mr. Martin.*)—Was that in India?—Yes.

2378. If commanding officers were to see that the medical officers were highly informed upon sanitary questions, would they not then be disposed to receive them and accept them as their constituted and official advisers on such matters?—I think that would depend upon the consideration that the public give to the subject; if the public are fully impressed with the value of sanitary arrangements, the commanding officers will, of course, be inclined to listen to them.

2379. That is, public opinion would be brought to bear upon the question?—Yes.

2380. (*President.*) If it was made a matter of regulation, that medical officers should be consulted upon such subjects, though of course their opinion must give way to strategic considerations, do not you think that commanding officers would hesitate before they disregarded such an opinion?—I think they would; there are many points in military discipline that are opposed to sanitary principles; a commanding officer likes his regiment compact, and he does not like to spread them about.

2381. (*Sir H. K. Storks.*) In tents?—Yes; he likes to have them compact; and the company officers object if their men are much spread out, they cannot keep an eye on them so well.

2382. (*Mr. Martin.*) You have been a good while a regimental officer, have you not?—Yes.

2383. Do you think that the commanding officers, and the officers generally, feel an interest in the health of their men?—I do not think the company officers interest themselves much in it.

2384. Do you think that commanding officers feel an interest?—Yes.

2385. Do they visit their hospitals frequently?—Some of them do.

2386. As a practice, how often do they do so?—I think, as a practice, once a week.

2387. Do they merely walk through the wards, or do they take an interest in individual cases?—I think that the commanding officer generally shows an interest; the orderly officer comes daily and asks if there are any complaints. I do not think that commanding officers of companies generally interest themselves very much.

2388. (*Mr. Alexander.*) Do you consider that sanitary knowledge is of the utmost importance to a military medical officer, and is he not the officer best qualified in the service to give an opinion?—Yes.

2389. Is the medical officer consulted as to camps and hospitals, with regard to their construction, drainage, and sewerage?—The medical officer is not always consulted. He does not know how far it is his business to come forward and give his opinion. If he were to do so, he might meet with a rebuff.

2390. (*President.*) Looking to the importance of the advice that he gives, do not you think that he ought to be protected by having his position in that respect defined by instructions?—I think that that is very essential.

2391. (*Mr. Alexander.*) Ought he not in your opinion to be consulted upon those important matters, as being the best capable to give an opinion upon such subjects?—Yes; I remember an instance where a parade in contiguous close column was ordered on the 2d of June, at Dinapore, by the general commanding, to read a court-martial. The square was rather small. There were four regiments, besides artillery, and they were ordered to parade in line of contiguous close columns, which at such a time I thought very objectionable, and I immediately addressed the commanding officer on the subject.

2392. (*Sir H. K. Storks.*) The commanding officer of the regiment?—Yes; of those assembled, I said, there was no calculating what the risk to the health of the men was. I addressed my own commanding officer, and I said at the same time, that I thought such an assembly in contiguous close column, at such a season, was attended with great risk.

2393. (*Mr. Martin.*) Had you on that occasion any instance of heat apoplexy?—We had cholera at the time prevalent. My commanding officer took up the thing. The court-martial had been already read to his regiment, and in forwarding my letter he mentioned that circumstance to the general, but there was no relaxation in the order, further than that the 80th regiment might parade in quarter-distance column.

2394. Was that a general of Her Majesty's army, or of the Indian army?—Of the Indian army.

2395. (*Sir James Clark.*) Did any evil arise?—Cholera was much more prevalent afterwards, as I expected it would be, and my report still exists to that effect.

2396. (*Mr. Alexander.*) Have you found difficulties at Chatham in carrying out sanitary arrangements, even of the most trivial nature, such as with regard to deficient drainage, leakage, and sewerage?—There is the difficulty, as you have to apply here, there, and everywhere.

2397. What course do you take?—I should have to apply to the commandant to get it done, and he refers it to the engineer, who is, perhaps, busy.

2398. Ought you not to have it in your power to desire such matters to be repaired immediately, directing the purveyor to obtain hired labour for the purpose?—Yes; I consider that a general hospital should be efficient in itself in all its parts.

2399. (*Sir H. K. Storks.*) You would have a perfect establishment?—Yes; so that we could do our own washing, and obtain our own supplies, and everything.

2400. (*President.*) What is your opinion as to the relative advantages of regimental and general hospitals in the field?—I think that the early part of the war in the Crimea showed that the regimental hospital system was not sufficient. All the regimental hospitals were defective; they had not an establishment adequate to meet the demands that were made upon them.

2401. (*Sir H. K. Storks.*) And they broke down?—Yes; showing that in war when there is any pressure you require a general hospital in the rear; I would have a divisional hospital in the front.

2402. (*Mr. Stafford.*) Do not the men like the regimental hospitals best?—I think they do.

2403. (*Mr. Martin.*) Are not general hospitals esteemed in the army as necessary evils?—Not as evils. You cannot move before an enemy with your regiment encumbered with sick and wounded, and you must send them away; you must have a general hospital. The evil in the Peninsular war was this, that if you sent every man away because he could not march the next day you lost his services for a month, whereas if you could keep him for 48 hours you would only lose his services for that time, and therefore regimental hospitals were established.

2404. (*President.*) You say that you would have a general hospital for the purpose of receiving all those cases which could not be cured quickly enough to enable them to rejoin their regiment, and a regimental hospital for all the lighter cases?—I would have a divisional hospital; it would take much fewer appliances; if you complete every regimental hospital you must have duplicates and triplicates of a number of things; you must have in each, for instance, a set of all kinds of instruments.

2405. You think that the formation of a divisional hospital for those purposes would cause less trouble and labour than a multiplication of regimental ones?—Yes; with a division in the Crimea, the purveyor having every morning to serve extras or medical comforts for several regimental hospitals, had much more trouble than he would have had with a divisional hospital.

2406. (*Mr. Martin.*) The general hospital, you recommend, should not be a larger one than the divisional hospital?—I think a divisional hospital is the thing, with the power of detaching. You might have many comforts in a divisional hospital; you might carry a bath as a divisional bath, but every regimental hospital could not carry it, and you might carry very many things which perhaps every regiment need not carry; perhaps every regiment would carry a pot of belladonna, and one pot would answer for the whole division.

2407. You are aware that the great general hospital at Coimbra and Abrantes, contained 12,000 and 15,000 men, and the evils that were generated there were of a terrible nature, and not of inferior character to those of the general hospitals in the wars of George the Second; that new diseases made their appearance, and that they did not cure the old ones; that discipline was neglected, and the moral and physical evils were enormous?—Yes, it was very bad. If you accumulate 15,000 sick anywhere it is a very bad plan, but a general hospital would be limited.

2408. (*President.*) But the reason for accumulating them is, that there is no means of keeping them apart?—I think that now-a-days they would never accumulate 15,000 in that way; they would send them home.

*J. R. Taylor,
Esq., C.B.*

22 May 1857.

J. R. Taylor,
Esq., C.B.

22 May 1857.

2409. (*Dr. Andrew Smith.*) In the case of a divisional hospital it would only be applicable provided a large division were close to it?—I think that in European wars you never move less than divisions. In India the regimental hospital system is perfect.

2410. Would it not be necessary that the divisional hospital should be so central that all the medical officers of the regiment could go there and attend it?—Yes.

2411. Suppose that a division was so scattered that that could not take place, and that you had no regimental hospital, how would you meet that difficulty?—I would do as the French do. I would allow one tent where a man might get an emetic, but the ambulance should call morning and evening, or I would send the sick man at once to the divisional hospital, and the regiment should be perfectly unincumbered.

2412. How many regimental medical officers in that case would you have?—The same as now. Every regiment should be required to attend to its own sick in the divisional hospital.

2413. Suppose that a regiment were at such a distance that the medical officers could not walk easily to the divisional hospital twice a day?—I do not think that before the enemy that would ever be the case. It was not so in the Crimea. The hospitals were generally very close together. In fact they were divisional hospitals.

2414. (*Mr. Alexander.*) When the third division established their hospitals, had they not, in consequence of the effluvia arising from sickness, to separate and detach their hospital marquees, and to spread them over a greater extent of ground than in those divisions which had only regimental hospitals?—No, I am not aware of that. The third division was about the most healthy in the Crimea.

2415. Do not you think that regimental hospitals established immediately behind the regiment have many advantages compared with regimental hospitals clubbed together in the field?—I should say, looking at the efficiency of the regiments in the field before the enemy, that a divisional hospital or regimental hospitals clubbed together in the rear is the best plan. In the Crimea we had the enemy fixed in lines in the front, and if the army had been moved you could not have had the hospitals with the regiments.

2416. Why not?—You must have them in the rear somewhere.

2417. Could not you lay down certain rules, and say that a surgeon is to carry with each battalion a certain portion of bedding with a waggon containing medicines and stores for a certain time, and allow him to treat cases?—I suppose that there is a regimental medical officer always on duty with the regiment, and if any man says he is sick he is taken to this medical officer in a tent where there is a sergeant. The surgeon sees this man and perhaps he finds that he has been drinking, and he gives him an emetic, and says, "Let him lie down here, he will be all right to-morrow morning." But if he has an attack of fever coming on he would be a fortnight sick, and he would say, "Call the ambulance and send him to the divisional hospital." And the divisional hospital must be on that scale that you might contrive to carry on a certain number, or send them to the rear.

2418. The divisional hospital would move every day with the division, would it not?—Yes; but I may say that a divisional hospital would be able to afford this man conveniences that a regimental hospital could not.

2419. (*President.*) Is it possible to lay down in this room any rule upon a subject which must vary with the peculiar circumstances of each campaign?—No; I agree with that; I think that the regulations on service must be extemporized in a great measure to suit the climate and the nature of the service.

2420. In peace do you think that we have a sufficient number of general hospitals, taking England and the colonies all together, to let the medical officers see how a general hospital should be conducted and organized, so that in war they would know how to do

everything?—I could not say that we have not got a sufficient number. I do not know where they are.

2421. Would you have a general hospital at a place where you have a very large garrison, for instance Gibraltar and Malta?—I should think that a general hospital must be necessary there; say that a regiment is ordered away, it is necessary that they should have some place to send their sick to, and not to a regimental hospital; but I do not know that there is not a general hospital at Malta.

2422. Have you ever considered the subject of the ration of the soldier?—I have, but not in England much; I did in the Crimea a good deal, and in India also.

2423. The ration at present supplied to a man, and which is given to him by warrant, and which is sufficient for his maintenance in perfect health and efficiency, is a pound of bread and three-quarters of a pound of meat?—Yes.

2424. Do you think that the meat requires a corrective of some kind?—Yes, it requires vegetables.

2425. At present, at home the soldier is compelled by his commanding officer to provide himself with vegetables, and sufficient food for a third meal?—Yes, and there is a deduction on that account.

2426. When the army was in the Crimea did that system answer, or did they abandon it?—The system there was perfectly different; the commissariat supplied everything.

2427. It was found necessary that the commissariat should supply everything?—Yes.

2428. And there was an additional stoppage levied upon the men for it?—I was not aware of that.

2429. Are you acquainted at all with the rations of other armies?—No.

2430. You do not know the Russian ration?—No. I saw some Russian bread which was very black indeed.

2431. Do not you think that the Government ought to supply the soldier with such a ration as shall at all times keep him in a state of health and efficiency?—I think so.

2432. There should, you think, be vegetables and that kind of nutriment which is necessary to correct the effects of a diet consisting merely of bread and meat?—Yes.

2433. The difficulty in the Crimea arose at first from the commissariat not being accustomed to supply those things; they were not prepared to supply them, and the men could not obtain them?—Just so.

2434. (*Sir H. K. Storks.*) Do you think that the ration at home is sufficient to keep a young man doing the usual duties of a soldier in good health?—I think at home they thrive upon it; you see poor wretched recruits in a very short time become stout.

2435. (*Dr. Andrew Smith.*) Do you think that three-quarters of a pound of meat, considering that it contains a certain portion of bone and a little fat, is sufficient for a vigorous able-bodied man, with heavy duties to perform?—I think that a pound would be better. I think it is a small quantity; but if you go through the garrison at Chatham you will find all the young soldiers looking very stout and well indeed; of course they must buy things.

2436. (*President.*) Do they depend upon the ration entirely?—No; they drink a good deal of porter, you see them bursting with fat.

2437. (*Dr. Andrew Smith.*) Would a servant of yours be satisfied with three quarters of a pound of meat?—I think not.

2438. (*Sir H. K. Storks.*) Do you think that the cooking of the soldiers' rations is very good, or is it good at all?—I think it is very good.

2439. You think that it is not a bad thing for men always to eat the same sort of dinner every day?—That is a matter of economy and arrangement. If you choose to adopt a variety, well and good; but I think he lives very well on the same.

2440. (*Mr. Martin.*) Is it not found in all countries that a mixed diet is most conducive to health?—Yes.

2441. (*Dr. Andrew Smith.*) How much out of the three-quarters would be lost by cooking, and by getting rid of any bone that there might be in it?—I think if you take 12 ounces of meat, it would appear after cooking three or four ounces short.

2442. (*Sir James Clark.*) Do you know how the sailors are dieted; do they get a fixed diet without deductions; might not that system be adopted in the army without stoppages?—I think it might be greatly simplified.

2443. (*President.*) You do not see any objection to the monotonous cooking, for 21 years, the same diet every day?—I confess that I have not observed any; I think that habit has a good deal to do with it.

2444. (*Mr. Martin.*) Is it not held by the profession that sameness in diet, even without the intervention of salt rations, will induce a scorbutic state, if extended over a long period?—I cannot immediately give an opinion upon that.

The witness withdrew.

THOMAS ALEXANDER, Esq., C.B.

2450. (*President.*) You are inspector general of hospitals?—Yes.

2451. Have you turned a good deal of your attention to the subject of education and the conditions which you think ought to be required from candidates for the army medical service?—Yes.

2452. Would you require a medical as well as a surgical diploma from such candidates?—Yes; as military medical officers, generally speaking, treat cases that come under the head of general practitioners, it will be necessary that they should attend classes for all these branches.

2453. Including midwifery?—Yes; because they have to practise it occasionally.

2454. Would it be advantageous to have some examination into their general education?—Yes, it would be of service.

2455. It being a better test of a man's capacity?—Quite so.

2456. Would you make examination for admission by a medical board practical?—Decidedly so, and competitive.

2457. As much so as was described by Mr. Paget in the evidence which he gave here?—Yes.

2458. Would you prefer a separate body of examiners; suppose, for instance, that an arrangement could be made that for the army, navy, and East India Company there should be one board of examiners?—I should prefer a separate body of examiners, because being accustomed to examine, they would be much more likely to test the capacity of candidates than men who only occasionally do so.

2459. Would you have any second examination before their promotion to a surgeoncy?—It would be difficult to do that; but if you could induce officers to keep up their knowledge it would be advantageous.

2460. Should you say that there is a tendency in young men, on joining the army, to be led away by the habits of the regiment from their professional studies?—Quite so.

2461. Would not the prospect of an examination tend to limit that evil?—Yes, it would.

2462. (*Sir H. K. Storks.*) Has a regimental surgeon any power to make his assistants improve themselves in the knowledge of their profession?—He cannot compel them to study, but he can give them certain duties to perform, and advise them to study.

2463. (*President.*) You would make the second examination a more special one than the one under which he had been admitted originally?—A more practical examination concerning the treatment of disease, hygiene, and all that is connected with his real duties as a regimental surgeon.

2445. Do they not find in the French army, that confining the men to biscuit for a length of time has an injurious effect?—I look upon biscuits as very inferior to bread.

2446. Not only inferior, but that the sameness of the ration produced scorbutic effects?—I think that a man might eat bread every day, but not biscuit for more than three months.

2447. (*Dr. Andrew Smith.*) Have you not observed at Chatham, on Sundays particularly, a great number of men in the garrison carrying dishes to be baked?—Yes.

2448. Does not that show that they like a change?—Yes.

2449. (*President.*) Are you aware that at the Cape our troops, from living upon fresh meat, suffered from scurvy for want of a variety?—I think that meat diet exclusively would be injurious.

2464. Everything relating to the specialties of military life?—Yes, and a general knowledge of his profession.

2465. Where do you contemplate that the candidate should acquire any knowledge of the theory of military hygiene?—In the large general hospital at Netley. I would recommend that three lecturers should be appointed permanently, who would give clinical lectures on medical and surgical cases, and also on pathology and morbid anatomy, and teach the practice of operative surgery, and so on.

2466. (*Sir James Clark.*) And military hygiene?—Yes, of course, everything connected with hygiene.

2467. (*President.*) Would Netley be a good place for that purpose? Would the number of cases be sufficient to afford examples of what was taught?—Yes, but they would be all chronic cases; still they would see the sequelæ of the diseases, the termination of them; they could also study pathology, the use of the stethoscope, operative surgery, and hygiene.

2468. Do you think that those chronic cases, so far as military hygiene was concerned, would be more useful than acute cases?—They would be very useful; at Netley they would see the termination of the disease and be prepared to recognize and check it in practice.

2469. Do you think that Netley is better adapted from its position than Chatham for invaliding?—Yes; it is more convenient for invalids arriving from foreign stations.

2470. How long would you keep a probationer at Netley before you sent him away?—For several months, so that he should learn hygiene and all the different returns and reports, also the diet tables connected with the department, field equipment, &c.

2471. Would you appoint him in the first instance to a regiment?—Yes, to a regiment, because he would then become acquainted with regular military duty.

2472. Is it customary to appoint him indifferently to a regiment and to the staff?—I believe so.

2473. You would have him go through a regiment first?—Quite so; on the staff a man may be for years and know nothing of regimental duty, at least not sufficient; but in a regiment he becomes better acquainted with the habits of soldiers and military life.

2474. (*Mr. Martin.*) Do you look upon a regimental surgeon as the most important medical officer in the army?—Yes.

2475. (*President.*) Do you agree with Dr. Taylor as to the advantage of allowing periodical returns home from foreign stations, on leave of absence, for the purposes of professional study?—Yes, I should recommend so many months' leave for every year's service abroad, so that an officer on returning home might have an opportunity of proceeding to some

*T. Alexander,
Esq., C.B.*

22 May 1857.

medical school, and there improving himself in his profession.

2476. Would you give that to staff, as well as to regimental surgeons?—Yes, to both.

2477. Would you make the officers avail themselves of that opportunity?—I think that the great majority of them would.

2478. (*Sir H. K. Storks.*) How would you insure that they had spent their time in study; would you have an examination to test their improvement?—They might be called upon to produce certificates of attendance.

2479. That would not be made, you think, an excuse for idleness?—No, not by the great majority.

2480. Could you rely upon the certificates?—They would be some test.

2481. I suppose you would make Netley a model on which other general hospitals should be formed?—Yes; at Netley I would have the museum brought from Chatham, and the library, and I would have a model room for improvements, and models of hospitals and barracks, ambulances, and camp equipages, &c.

2482. Would you have phthisical wards?—Yes, and that would save an immense deal of misery. Many poor wretches are discharged, who go amongst their friends where they can get no assistance; and it would save a great deal of misery if a few wards were established for such cases.

2483. Would you also have quarters for sick officers?—Yes, as in the navy.

2484. And lunatics?—Yes. I think it would be advantageous to have a lunatic establishment attached to the general hospital and adjoining it.

2485. Would the lunatics be better treated there than if you sent them out into private establishments?—Yes, provided you have men equally qualified to treat them.

2486. You could not carry on the duties of the lunatic asylum by taking officers in their turns?—No. You must have men specially appointed for that duty, men accustomed to the treatment of lunatics, and if found well qualified they should be permanently attached.

2487. (*Sir Thomas Phillips.*) That would also be the case as to the teachers at Netley?—Yes.

2488. (*Dr. Andrew Smith.*) You stated that you thought every medical man entering the army ought to have a surgical diploma and also a medical diploma, in order to insure that he had studied in all the different branches of the profession. Do not medical students at the present time study all the different branches of the profession?—I believe for the London surgical diploma they do not require it. They do in Edinburgh and in other places. I may be wrong, but I think it is purely surgical in London.

2489. Would you propose that they should be all compelled to take a degree of a university, or to be all examined previously by the Apothecaries' Company?—Those in London should produce certificates or diplomas of having passed the Apothecaries' Company, or any college that was deemed requisite for general practitioners.

2490. In the case of Edinburgh what is the practice?—In Edinburgh all those branches are taught. There they are examined for their diploma in those separate branches, but I believe in London they are not.

2491. Would you consider the Edinburgh diploma a sufficient test?—The holding of an Edinburgh diploma would be a test that he had been examined in physiology, the practice of physic and midwifery, and other subjects; but I do not conceive a London surgical diploma would.

2492. How would you receive a diploma of the Dublin College of Surgeons?—On the same principle. I should ascertain by inquiring whether their diplomas were granted after examination in those various subjects, and if so, I should receive them as satisfactory.

2493. That would be a question to ascertain beforehand?—Yes.

2494. With reference to the second examination, supposing it were considered desirable, how could it

be carried out?—In the navy they carry out a second examination.

2495. But suppose an old assistant-surgeon in New Zealand, perhaps the senior, and according to practice entitled to be the first promoted, how would you get his examination effected?—It would be very difficult.

2496. (*Mr. Martin.*) Might he not be promoted, subject to an examination, on returning home?—Yes; but if service by roster, and fixed periods for service abroad and at home were established, you would then bring officers home in a very few years. There are difficulties in it, but by requiring a second examination you would induce a medical officer to keep up his professional knowledge.

2497. (*Sir James Clark.*) Does it often happen that an assistant-surgeon from the time he gets his appointment to the time of his becoming full surgeon, is out of the country?—Quite so. But if a roster were established, those officers would come home more frequently.

2498. (*Dr. Andrew Smith.*) You stated that in the hospital at Netley there would only be chronic cases; now as it is usual wherever an invalid hospital is established to have from 500 to 600 invalids in the hospital, and as at Chatham nearly one-third are acute cases, perhaps a man takes cold and is attacked with pneumonia, would not that supply a tolerable amount of acute cases?—Yes; but the generality of cases there no doubt would be chronic.

2499. About a third of the cases at Chatham are acute?—But the acute cases attacking invalids would be of a different type from those which attack healthy men.

2500. Would it be practicable to send every candidate in the first place to a regiment?—I think it would be desirable.

2501. Would it be practicable?—I have not made a calculation; but if you appointed every man at first to a regiment, and after being in it for so many years, held out the inducement of becoming staff assistant-surgeon, and having charge of the staff at the different stations, I think you would make it practicable.

2502. Are you not aware that the rule at present existing is that no man shall be eligible for the rank of surgeon before he has served a certain time in a regiment?—I was never a regimental assistant-surgeon.

2503. Have you not heard that for the last five or six years that has been the regulation?—I believe it has.

2504. (*Mr. Martin.*) Should there not be a reserve corps of young medical officers?—There ought to be a larger staff.

2505. For the service of the colonies?—Yes.

2506. Upon any foreign expedition being formed such a corps would be doubly necessary?—Yes; it is no reserve corps, but they go to the colonies from home.

2507. Is there a reserve corps of them at Chatham under instruction or anywhere else?—No. If you were to grant leave, as I propose, and establish a roster, you would require a larger staff, and have, consequently, more officers for any emergency.

2508. Was not the want of such a reserve corps felt very early in the recent war in the east, and especially from the landing at Eupatoria?—Yes; civilians were brought in.

2509. Does not it always result on foreign expeditions that, in consequence of wanting such a reserve corps, they are obliged to introduce unqualified young men from the schools, untrained to their military sanitary duties?—If you want medical officers, and have not a sufficient number, in the event of war you must either take civilians, employ them and pay them well, or you must take assistant-surgeons without sufficient qualifications, or the experience that is necessary.

2510. Therefore such a reserve corps would be valuable?—Yes; a larger staff.

2511. (*President.*) Would the existing general hospitals and the regimental hospitals give sufficient practice and employment to keep a larger number of

men up to the mark in their profession?—Yes, provided you gave a fair share of leave to the medical officers in the army, in order that they might take advantage of it, and improve themselves in professional knowledge.

2512. (*Sir Thomas Phillips.*) Would your plan be this; would you test a candidate in the first place by ascertaining in some satisfactory manner that he possessed medical and surgical knowledge, and would you then send him to the large general hospital, where he would not only have opportunities of practice, but where he would also see the management of a large establishment, and in that way get into the routine of his public duty?—Yes.

2513. Then I think you say you would promote him to be assistant-surgeon of a regiment?—I would appoint him, it is not promotion.

2514. What would be your routine afterwards?—He should remain in that regiment until he was either promoted, or, as I suggested, until he was removed to the staff; after having been so many years in the regiment he might be appointed to a station, such as Nova Scotia, or other stations in charge of the staff.

2515. I thought you stated that you would appoint at first an assistant surgeon for a certain time to a regiment?—Yes.

2516. Should he be assistant-surgeon on the staff next?—Yes; both are of equal rank.

2517. Would you retain the appointment of assistant-surgeon on the staff too?—You must have them on the staff too.

2518. Would you have all assistant-surgeons indiscriminately regimental and staff, or would you send them through a regiment to the staff?—My opinion is this, that an assistant-surgeon should go first, after he leaves Netley, if possible to a regiment where he would become acquainted with military duties, and would associate with officers, and where he would be looked after, instead of being a staff assistant-surgeon going to a station where he is left to his own resources to do as he thinks proper.

2519. Would he become an assistant-surgeon on the staff?—That does not follow.

2520. You do not think that is necessary?—There are perhaps not vacancies enough. I think some men prefer a regiment and others the staff, but I would hold out to the staff assistant-surgeon an inducement, and give him such a charge as Nova Scotia, &c.; where he would attend the general and his family, and all the staff officers and their families, &c. Then these staff assistant-surgeons would get lodging money and horse allowance, besides escaping the expenses of a mess; it would be a sort of boon to them.

2521. It would be in fact an advantage to them?—Yes; it is thought by some a more desirable service, but I would first if possible send a man to a regiment to learn regimental duty, to be looked after and to associate with the officers.

2522. (*Dr. A. Smith.*) Are there not certain other objections, namely, that they are put to extra expenses?—Yes, there are difficulties.

2523. With the present rate of pay medical officers with no private means are totally incapable of meeting the expenses of the change?—There are expenses; but many changes take place now from staff to regiment, according to the exigencies of the service.

2524. (*Sir T. Phillips.*) It would be hard to expose them to such expenses without giving them some better pay?—It is done so now.

2525. (*Sir H. K. Storks.*) Would it be desirable to give regimental surgeons more authority than they have now over their assistants to make them work?—I do not see how you could compel them to work. There are certain duties which they are called upon to perform under the superintendence of the surgeon; but you could not compel an assistant-surgeon to go to his room to read for so many hours.

2526. (*President.*) Within a hospital do you consider that the medical officer might be relieved from much work that he now performs, if the purveying

were put upon a better system?—Yes; the purveyor, I think, ought to have charge of all hospital furniture, hospital dresses, and everything requisite for an hospital, and they ought to be supplied at once, without any requisition, according to the number of patients. He ought also to purchase or make contracts for all the dieting of the patients, and the washing ought to be done under the purveyor by hired labour; kitchens with good ranges for roasting or baking, so as to vary the diets occasionally, and laundries with drying rooms should be attached to each hospital.

2527. He should be the steward of the hospital and have it complete in every respect?—Yes.

2528. That would get rid of many requisitions, the writing of which now falls upon the medical officer?—Yes, and also of the barrack department having hospital stores in their possession.

2529. Do you think that you could shorten his duties by a simplification of the returns?—I think, with regard to the diet table, you could simplify the duty by having it monthly instead of daily, as at present, entering the name of every patient: were all the returns printed and condensed you would save an immensity of labour; in a great majority of cases I conceive that merely entering the name in the admission and discharge book, or in a tabulated form book, would be quite sufficient, you could have the "name of the patients," the "disease," the "regiment," when "admitted," "died," or "discharged," with a short summary of his treatment, which I think for the majority of cases would be quite sufficient.

2530. What would you insert in the register?—The most interesting and the acute cases.

2531. Is it a fact or not, that as the registers are now filled they lose their value in a scientific point of view, in consequence of their bulk?—Yes; I think if it was laid down as I have stated, you would find that medical officers would take more interest in describing the acute cases than they do now.

2532. (*Dr. A. Smith.*) Are you aware that the necessity for registering those cases has principally arisen from the constant applications from the Chelsea Commissioners and from the Adjutant-General, and from the authorities connected with the invaliding, so that it is necessary that we should have some means of obtaining information, otherwise we could not give the replies that are asked for?—I think you might have such a book as I have described, and that would give all the information required in one line.

2533. (*Mr. Martin.*) It would give the history of the soldiers' health?—Yes; if you chose to give a page for every patient you would have a view at once of every admission, and the history of the man through his whole career.

2534. (*Dr. A. Smith.*) Are you not aware that a medical officer is required to give some sort of statement in the man's discharge document, to enable the Chelsea Commissioners to judge whether he had suffered from certain diseases which were likely to materially affect him in the discharge of any labour he might afterwards undertake, or render him less able to earn a livelihood?—You would see all this in a tabulated view as I have suggested; a man may come in and be discharged, and in six months hence he may be admitted again, and every time he came in you would have a tabulated view, so that at a glance you would see the whole history of the man.

2535. Dr. Taylor, from Chatham, within the last six months has written to me with reference to probably 150 cases of men who have presented themselves at Chatham to be invalided. There was a trifling case connected with a man's heel. This man said his heel was injured by a shot, but there was no indication of a shot. An application was made to the regiment, and the return was, that it was so trifling a case when he was admitted, that they did not think it necessary to register it, and the consequence was, that they could not say whether the man had had a shot or not?—According to the plan I have proposed, you would have the man's whole history in one page.

*T. Alexander,
Esq., C.B.*

22 May 1857.

2536. (*President.*) Is it not the fact, that a similar record such as you describe, showing the whole of the medical history of a soldier, in the same way that the regimental defaulters' book shows his character, would answer all purposes?—Yes; it would be quite sufficient, in my opinion.

2537. Would not the fact that your record was less voluminous make it more likely that it should be referred to than in the case of a register which was very voluminous, and gave a great deal of trouble?—Yes, and it would be at hand; the registers are left behind when they become too bulky.

2538. If the interesting cases were those which had the predominance in the register, would it not be well to encourage medical officers to record them, for the purpose of securing the advantage of one another's experience by publication, or in some other way to communicate to officers in the army the system of treatment and the results?—If there was an officer whose duty it was to examine all reports, and cull out the facts, data, and interesting cases, then publish them, a great deal of useful information would be obtained regarding the statistics of disease, &c.

2539. Suppose an expedition about to start for China, with many medical officers attached to it who had never been in China before, if the registers of the last Chinese expedition afforded records of the treatment of the peculiar diseases that were then prevalent, would it not be a great advantage to communicate them to the medical officers now going out?—The data, facts, and deductions drawn from the cases would now certainly be of great service to any man going out to that country.

2540. Why cannot that be done from the existing register?—It might be, but it is exceedingly voluminous. You must have a special officer to cull those facts.

2541. Is it the fact that having to write upon a variety of cases, and having to waste some time upon the uninteresting cases, the interesting cases do not get the same amount of care bestowed upon them?—Decidedly not so much care. When I was at Chatham I recollect an assistant-surgeon telling me that he had received an order to write two lines on every patient's case, and on his stating that it was impossible to do so, he was desired to call into play his ingenuity.

2542. (*Dr. A. Smith.*) A great deal more is exacted from officers at Chatham for the purpose of testing a man's abilities?—I think it is laid down in the regulation that every case must be duly registered with the exception of "itch."

2543. (*President.*) Are not the registers in practice so extremely voluminous that they are of very little service afterwards?—The majority of them are of no service at all, at every station there are a lot of old registers which are made no use of whatever.

2544. (*Dr. A. Smith.*) How many years are they required to be kept with the regiment?—Until they are filled up. If you are going abroad, and you report that they are too heavy, you get an order to leave them behind. I think, in the way that the diet tables are now arranged, writing the names of each patient daily, an immense deal of labour and valuable time are spent, and the same could be done equally well on a monthly diet table.

2545. Was the table that Mr. Robertson produced at the last examination an improvement upon the existing one?—Very much so; if it were made monthly, instead of weekly, I think it would do very well indeed.

2546. You are instructed to fill up this list yourself, are you not?—Yes, I think every medical officer ought invariably to mark his own diets.

2547. (*Sir H. K. Storks.*) In figures, or in letters?—In letters; L. for low, and H. for half. I think the ward-master should make out a list of so many halves, and so many lows, and so on, for the purveyor each day for his guidance.

2548. (*Dr. A. Smith.*) What security would you have if that system were introduced, that if half

diet was marked in figures a man would not alter the number of diets?—They do not do so, and you must place a certain confidence in men.

2549. Are you not aware that was done, and that that necessitated the adoption of the present plan?—No, but writing it in words would prevent such being done.

2550. (*Sir H. K. Storks.*) When a medical officer arrives at a high rank in his profession, I suppose he cannot afford time to practise in the hospitals, in the general hospitals for instance?—If he is appointed to a general hospital and is in charge of it, it is his duty to go round and see the patients.

2551. But his time is greatly occupied with the returns, is it not?—Greatly.

2552. Does he prescribe?—Not generally speaking.

2553. (*Mr. A. Stafford.*) Does he operate?—Certainly, I always did when requisite.

2554. (*President.*) Should the totalling be done by the medical officers or by the steward in your opinion?—Unless you can place that confidence in your ward-master or steward, the medical officer must do it.

2555. Practically, are the totals always made by the medical officer?—They ought to be, at present.

2556. Is not a great deal of that put upon the steward or the ward-master, merely receiving the signature of the principal medical officer?—Yes.

2557. If you impose too much upon a man, he will evade it?—Yes.

2558. You stated that you were of opinion that the purveyor ought to provide everything for the hospital?—Yes, bed and personal linen and everything requisite for the comfort of the patient, knives, forks, spoons, crockery, and a small table and chair at each bed. I think there ought to be laundries to each hospital, also drying-rooms, and the washing should be done by hired labour by the purveyor, and the same would then be better and more cheaply done.

2559. You heard the evidence given by Dr. Taylor, as to the inferior manner in which the hospitals are treated at Chatham, compared with Melville hospital, belonging to the Marines; do you agree with that evidence?—Yes, I agree as to the difference between the two hospitals, the Melville being so very superior to the others, in every respect.

2560. Do you attribute that to the circumstance that the army medical officers are dependent upon other departments, who have no interest in keeping the hospitals in a state of high efficiency?—Yes.

2561. Dr. Taylor made a statement with regard to the delay caused by applications to the engineers' department; has it come under your observation, whether applications for repairs have either been delayed, or not carried out, or carried out very expensively?—Yes; I made a tour of inspections in Canada, in October last; and at Toronto, I found a privy, the effluvia from which was much complained of, and fit to knock you down, at times. The commanding officer and surgeon brought it before me, stating that they had frequently reported the same, and wished to have it remedied; the simple remedy was, to shut it up, and erect another over the lake. There was another case of a slight leakage, at the hospital at Kingston citadel; it had been reported several times, and not attended to. There was also a drain leading from the privies at Kingston citadel in a most offensive state, and out of repair. A board had sat, and reported its state, recommending that the rain falling in the barracks should be collected into tanks, and the privies sluiced occasionally; but months had passed without the recommendation being carried out. I brought it to the notice of the general commanding, and before I left, I was informed, that it was about being remedied.

2562. (*Sir H. K. Storks.*) Were those expensive works?—No. I spoke to the engineer about the privy at Toronto, and he said that it had been placed in their estimates.

2563. (*President.*) What would be your remedy for those difficulties?—I think that at a certain season of the year an estimate should be sent in of the necessary

expenses of the hospital for the ensuing year, separated from those of the barracks.

2564. (*Sir H. K. Storks.*) Is not that the practice?—I am not aware of that. I believe they are generally clubbed together. But I would have the principal medical officer to send, as Dr. Drummond does at the Melville hospital, an estimate of the probable amount required for the ensuing year. Dr. Drummond's estimate is sent to Sir John Liddell, who, I believe, sanctions it or gets it sanctioned, and he immediately purchases articles or hires labour to do anything that is necessary or required.

2565. (*President.*) Have you not been called upon once a year to offer any suggestions that you might have to make for a hospital?—There is a general order; but what is the good of your suggestions unless the same are carried out, which is rarely done?

2566. If you gave the power to the medical officer, you would give a power to him to order anything that he thought necessary for the sick from the purveyor, and also power to order everything that he thought immediately necessary for the repair of the building?—Yes.

2567. What financial check would you have upon that?—He should make an estimate and send it to the director-general; the latter, examining it with the reports, would see whether those were necessary or not.

2568. (*Sir H. K. Storks.*) Suppose there were upon a sudden a drain that required repair, and it became very offensive, and it was an expensive work, would you let him have power to do it?—Yes, if it was not very expensive. I would limit him to a certain amount annually for purchasing certain articles and necessities; as principal medical officer he ought to have it in his power to remedy those evils at once, and to hire labour so as to have necessary repairs done immediately.

2569. Do you think that a dispenser is necessary to each regiment?—I think a dispenser ought to be attached to each regiment; and, as you have now good men as hospital serjeants, were they examined and passed the examination required, I would appoint them as dispensers; many of the hospital serjeants are first-rate men, and would make good dispensers.

2570. (*President.*) You would take those dispensers from the hospital staff corps?—Yes; but I would give a preference to good hospital serjeants, if they were qualified.

2571. (*Dr. A. Smith.*) The medical staff corps is now limited to a small number. Supposing that a man had served in a chemist's shop before he enlisted, and that he could be properly educated, and pass his examination as a dispenser of medicine, would there be any objection to taking that man out of the regiment and putting him into the hospital?—None, if he was not to be removed, and if you allow him to remain with the hospital; but you must not permit the colonel to take him away when he thinks proper.

2572. (*Sir H. K. Storks.*) Suppose he gets drunk, and misbehaves himself?—I suppose then you would confine him, or you would try him for the offence. Colonels of regiments often have orderlies and cooks on certain parades, to the inconvenience of the patients.

2573. (*President.*) This new corps is now going to be made a military corps, is it not?—I think so.

2574. Will it contribute to the efficiency of the service?—I think that a corps raised expressly for orderlies, cooks, &c., well instructed and retained as such, would be far preferable to the system of taking men from the ranks who are given as a favour, and who may be removed at the whim or caprice of the commanding officer.

2575. They might be removed after they had learned their business?—Yes.

2576. Would you select servants for the medical officers from this corps?—I would.

2577. For what rank of medical officer would you do that?—I think that all staff medical officers ought to have servants granted to them, and as a proof that such is necessary, I have seen myself, in Bulgaria, assistant-surgeons loading their own pack-horses, and leading them on the march amongst the common servants; these men were staff-assistant surgeons. They had granted to them at that time 1s. 6d. a day, as servant's allowance. Dr. Smith got it increased to 3s.; but you could not always get servants for 3s. a day. Medical officers on the staff are not allowed servants from a regiment, therefore I would take them from this corps.

2578. (*Sir H. K. Storks.*) Do you think it important that those men who are to be enrolled into this hospital corps should have been soldiers and have acquired habits of discipline?—I do not think that is of any consequence. I should prefer having good men well selected, even civilians.

2579. (*Sir Thomas Phillips.*) Would you subject them to military discipline?—I do not see any necessity for that. They would of course be under the Mutiny Act.

2580. (*Dr. A. Smith.*) Would there not be a difficulty in supplying the medical officers with servants from the medical staff corps? Supposing three surgeons were ordered from Chatham to-morrow, and each took a servant from the medical staff corps to go to the West Indies, or to Canada, or to the Cape of Good Hope, and supposing the servant became absolutely useless, you could not replace him; would it not, therefore, be better to make the allowance which is granted by the government sufficient to enable you to engage a good respectable servant from private life?—In peace time perhaps it would be so, but in war time servants will not stay with you; that happened to myself.

2581. (*Sir H. K. Storks.*) That happens to all officers who do not get soldiers?—All officers have bätmen attached, staff officers and all regimental officers have soldiers from the ranks, staff medical officers are the only exception. When in the Crimea I was allowed forage for eight horses, and was allowed by regulation only 3s. a day, to provide myself with servants to look after eight horses, cook, and look after my hut; other staff officers are allowed bätmen in proportion to the number of horses they are entitled to according to their ranks, not so the medical staff.

2582. (*Sir Thomas Phillips.*) You, I understand, propose that articles should be supplied to the general hospital by the purveyor, according to the exigencies of the hospital, and that he should be responsible for whatever is required being provided?—Yes; the purveyor.

2583. In that case the ward-master would be his servant, I apprehend?—The wardmaster would be held responsible for the stores that the purveyor had handed over to him, bedding, &c.

2584. Therefore the ward-master would be his servant?—Yes, so far.

2585. And the purveyor's duties in the ward would be discharged by the ward-master?—Yes, so far as regarded the hospital furniture and clothing; but the ward-master and purveyor would both receive instructions and be under the direction of the principal medical officer.

2586. The responsibility for the wards would be in the purveyor?—Certainly, through the ward-master.

2587. And for the state of the ward?—Yes, their cleanliness by the orderlies and ward-masters, but the medical officer would still be superior to all connected with the hospital.

*T. Alexander,
Esq., C.B.*

22 May 1857.

The witness withdrew.

Adjourned to Monday next at One o'clock.

Monday, 25th May 1857.

PRESENT :

AUGUSTUS STAFFORD, Esq., M.P.
Col. Sir HENRY K. STORKS, K.C.B.
Dr. ANDREW SMITH.

THOMAS ALEXANDER, Esq., C.B.
JAMES R. MARTIN, Esq., F.R.S.
Dr. JOHN SUTHERLAND.

PRESIDENT, The Right Honourable SIDNEY HERBERT, M.P.

T. Alexander
Esq., C.B.

THOMAS ALEXANDER, Esq., C.B., further examined.

25th May 1857.

2588. (*Mr. Martin.*) In the diet of the sick, you are aware that the medical officers are guided by the diet tables. In the Appendix to the hospital regulations, page 109, there is this: "This diet-table being so arranged as to prevent the use of any extras, beyond wine, porter, or spirits"?—You can give fowls and mutton chops, arrowroot, and so on, but you must place the man upon spoon diet; you cannot have him upon half diet, and at the same time give him in addition fowls, mutton chops, or beef tea, or anything—save wine or spirits.

2589. (*President.*) Is that right or wrong, the necessity of putting him on a spoon diet?—It comes much to the same thing, only it compels you to place him on spoon diet, to enable you to give extras.

2590. (*Mr. Martin.*) Would it not be desirable to enlarge and extend the dietary of the sick, thus furnishing more variety, so as to meet the caprices which are known to exist in the dispositions of sick persons?—I think if you extended and varied the diet, you might roast, bake, or stew, and consequently would require fewer articles to be marked as extras.

2591. You would recommend variety?—Yes, I would strongly recommend variety to patients in the hospital; but you must extend the kitchen arrangements, and adapt them for those purposes.

2592. By the regulations medical officers are required frequently to inspect the diets immediately after they are issued, and at times when such visits are unexpected by the servants, do you consider such a duty proper to a commissioned medical officer?—Yes, I think he does a great deal of good by looking in occasionally, and seeing that the diets are properly cooked.

2593. Should not his visits be open?—Yes, it should be done in an open and avowed manner; but the orderly officer does so, also the military medical orderly officer at Chatham.

2594. Do you not think it a duty more suitable for a subordinate than for the surgeon of the hospital?—Quite so; still I think it is the duty of the surgeon of the regiment to visit occasionally, and to see that those diets are good. In Caffreland the dieting was so bad that I went and saw the things weighed and put into the boiler one day. When the dinners were ready I then went and saw them, and told the patients that was the dinner they ought to have, and if they did not get it, to complain; they said they never had had such a dinner before. I saw the diets every day in the coppers while I was in charge at King William's Town, because the hospital serjeant in charge then in the 6th regiment could not be trusted.

2595. Are you aware that no deviation from the sick dietary is admitted, and that the medical officer, failing in giving a satisfactory explanation in case of deviation, is made to pay as being the prescriber of the diet, and do you consider that system a proper one?—I am not aware of any medical officer having paid, although I recollect when in Jamaica, a medical officer, being found fault with, who struck off all the extras in his expenditure account.

2596. With regard to the hospital regulation, page 25, article 55, do you consider that in respect of the

sick diet rolls, the medical officer should be held responsible for the accuracy of the totals of each roll, or is not that a duty rather proper to a subordinate?—I think that your ward-master or steward could total them perfectly well; placing that confidence in them, as they ought to be good men and worthy of such confidence.

2597. Do you regard the duty of check over the serjeant and others who may be disposed to record articles not duly ordered, a proper duty for a commissioned officer, or should it not rather be under the officer of supply?—The purveyor or officer of supply should check it.

2598. Those are all requirements of medical officers which imply occupation of time?—Yes.

2599. On stations other than home service or where hospital purveyors are not employed, is it for the good of the service that commissioned medical officers should be required to see that every article of diet for the sick in hospital should be delivered and paid for and duly charged in the quarterly accounts?—They are not proper medical duties. I think people ought to be set apart to do those things, and leave the medical men to attend to their professional duties.

2600. When troops arrive at a station having no deputy-purveyor, the medical officer in charge will, according to the regulations, take proper steps for procuring supplies, such as meat, bread, and so on, do you consider duties such as those proper for a commissioned medical officer?—They ought to be done by the hospital steward.

2601. Do you consider that a medical officer, whose duties should be confined exclusively to the scientific service of the hospital, and who is now said to be overlaid with return-making, should be required to receive tenders from respectable tradesmen, and accept such as may be deemed most advantageous, and all to be settled monthly by the medical officer himself?—It is not a medical officer's duty; there should be a steward or a purveyor for such duties.

2602. On foreign stations, when supplies cannot be obtained through the commissariat, is it right towards the surgeon or towards his patients, that the former should be called upon to purchase his supplies, taking care to substantiate by satisfactory vouchers his charges for such supplies?—That ought and could be done equally well by others—by purveyors or stewards.

2603. If the constituted department for the supply of food for the soldiers cannot find any, how is the medical officer to be expected to procure supplies under the circumstances?—Of course, if they cannot, how can he?

2604. Is it for the good of the public service that the medical officer should under any circumstances be held responsible for the custody of wine, beer, or spirituous liquors?—No, certainly not.

2605. (*President.*) He is limited by the regulations, he may only have a certain quantity in his possession?—I do not know what the quantity is: there is a quantity fixed at Aldershot, I believe; a bottle of wine, I think.

2606. (*Mr. Martin.*) It is your opinion that a

medical officer should not be held responsible for their custody?—I think he should not be made a store-keeper; he is a professional man.

2607. (*Dr. Andrew Smith.*) But has not every medical officer, treating patients in the hospital, the power in himself of varying the diet to any extent that he likes, giving fish or any other article that he thinks desirable; and if he thinks it necessary, by only putting the man on spoon diet?—If he puts a man on spoon diet he can give chops, soup, arrow-root, and fowls, but I never knew of fish being given.

2608. He is not prohibited from giving such, is he?—I am not aware that he is, but the man must be put on spoon diet.

2609. If a party of troops were sent from Quebec to a distant station about 200 miles, say two companies of a regiment, and there was a hospital with five or six sick in it, who would you propose should provide the supplies for the sick in that case, if the medical officer is to have nothing to do with dieting the sick?—I think that the hospital serjeant ought to do it, and take the part of steward of such a small hospital as that. If there is no purveyor the commissariat would give the usual things, and any extras should be bought by the steward or hospital serjeant.

2610. If there is no purveyor there and no commissariat, what would you do?—I should let the hospital serjeant or the steward purchase the articles required.

2611. Should he do this on his own responsibility, or would you hold the medical officer in any way responsible that the serjeant did not act unfairly to the public, there being no check upon him?—In the accounts the medical officer could certify that he believed those diets were issued to the men, the vouchers being attached to the expenditure account.

2612. (*President.*) Is that the practice of the service now?—At Templemore, in Ireland, when I was surgeon of the 60th Rifles, I was asked by the inspecting medical officer, whether I paid the tradesmen for the hospital accounts, and my answer was, that I paid them through the hospital serjeant, first having totalled them up, and seen that the accounts were correct. I was found fault with, and told that I must pay the money over to the tradesmen myself, and that he would report that I had not performed my duties as I ought, (not having paid the money myself to the tradesmen, with my own hands) and he did report it, because a letter came out to the Cape to my colonel, desiring him to call upon me to be more attentive in future in performing my duties according to the regulations.

2613. (*Mr. Martin.*) Do you consider it proper to the functions of a medical officer, that he should under any circumstances be held liable or responsible for matters of account connected with the dieting of the soldiers?—No; some one ought to be set apart for that special purpose, the medical officer attending to his professional duties.

2614. There are in fact other departments whose duty it ought to be?—Yes.

2615. (*President.*) In the case you have mentioned, in a regiment, with regard to the supplies to the sick, could not that be under the supervision of the quartermaster. Could not he do it for the hospitals as well?—He could do it; but I think if the hospital steward or serjeant were allowed to purchase them, the chances are, that we would get better articles than through the quartermaster, because we are allowed to give 1d. per lb. extra, by regulation, for meat.

2616. With regard to field hospitals, what is your opinion as to the manner in which the field hospitals should be organized for every battalion?—I think that every regimental field hospital should be rendered so far complete in transport as to carry a certain amount of bedding and stores for a certain period, and a division the same, and of course head quarters the same. The surgeon's signature, I conceive, ought to be perfectly sufficient for any stores that he re-

quires to keep up his stock, and the medical officers in charge of the division the same for the division.

2617. Would you make the surgeon responsible for the stock being kept up?—Quite so.

2618. Not the purveyor?—He would draw from the divisional purveyor and apothecary or dispenser for his medicines and other articles, comforts, &c., to keep up if possible his regulated supply before marching.

2619. For other stores the purveyor would be responsible?—Yes; but he would not know what the surgeon really had on hand, unless you had a purveyor attached to the regiment.

2620. Would you have a purveyor attached to a division?—Yes; only separate transport must be given to the medical department, to have this carried out, and hold it responsible for the same.

2621. Would not the separate transport very much complicate the movement of an army?—I think it would simplify it, if it was laid down exactly what proportion of ambulances and transport the regimental surgeon was entitled to, to carry field equipments, and men sick or falling out the march. Also were certain transport and ambulances, so regulated and laid down for divisional supplies, on moving, instead of its being all hurry scurry, each regimental surgeon would get what he was entitled to, and the division the same. (*See Appendix No. L.*)

2622. (*Sir H. K. Storks.*) But the general officer commanding would have a certain proportion of transport assigned to him from the military train, and he could appropriate a portion of it for the hospital?—Yes; but if you are moving forward you will always find that the hospitals come off second best.

2623. If you want transport for carrying ammunition and things of that sort, you would naturally supply that first?—Yes; but if you laid it down that a certain amount of transport was to be provided, in addition for medical purposes, the general would have his own amount of transport generally, and so would the doctors; and it is only allowing more transport according to the strength of the army, and giving the extra allowance to the medical department for its particular use.

2624. (*President.*) As the general is head over all, if he found it necessary could not he carry off your horses?—Yes, certainly; but I think you would have a better chance of getting what you wanted were a certain amount laid down for the medical department.

2625. (*Sir H. K. Storks.*) Was not this system adopted in the Crimea in the event of the army moving?—At first when we moved all that was given was a mule and panniers; then when we marched from Varna with great trouble, an araba was allowed to each regiment. When we landed in the Crimea we had nothing. Some surgeons were lucky enough to seize an araba, and they carried a few things, but they had no transport set apart.

2626. Were there no transport animals landed in the Crimea?—No, but there you seized them; the surgeons took possession of any araba that they found straying along the road. There was one instance in which one hospital serjeant seized upon an araba and put the panniers into it, when an officer, I was informed, came up and requested the serjeant to take them out, as it was required for the general staff. A short time afterwards officers' baggage was found in this same araba, the panniers of the hospital being left on the spot all night.

2627. (*President.*) In point of fact, whenever it was found that the general transport of the army was short of horses, and the medical transport were in possession of them, would they not lose their horses just in the same way?—Yes, they might; but if you laid down a certain quantity of transport for the medical department, you would give it in addition to the same amount of transport which you now do for the military.

2628. (*Sir H. K. Storks.*) But the transport must vary, must it not, according to the number of sick?

*T. Alexander,
Esq., C.B.*

25th May 1857.

T. Alexander, Esq., C.B. —In the field you do not carry the sick with you ; you send them generally back to the rear.

25th May 1857. 2629. You must have transport then, must you not ?—Yes, certainly.

2630. (*President.*) You could not maintain, as your permanent stock of transport, a sufficient number of animals to carry back the wounded after a general action, otherwise they would be idle and useless in the intervals ?—Yes ; but a mule with panniers ought always to remain with the regiment, because you use them for carrying water, wood, &c.—the remainder with the military train—and obtained when requisite to carry sick or wounded to the rear, and bring back supplies for the hospitals.

2631. (*Sir H. K. Storks.*) You have been at the Cape, have you not ?—Yes.

2632. Was not the transport very good there ?—No. When I first went, nothing was given to a battalion but one mule and panniers ; but I afterwards, by fighting, obtained a waggon for carrying hospital stores for my regiment, when we took the field.

2633. How did you send your sick back ?—We put them into the commissariat waggons, as the food was consumed, and also carried them frequently on stretchers.

2634. (*President.*) What you would have is this, no more transport than was necessary for you to carry about your ordinary matériel ?—Yes, and a certain amount of ambulances for men falling out on a march—sick or wounded—carriage for so many per cent., according to strength.

2635. But for sending the sick and wounded out of the field, you must always depend upon the general transport of the army, must you not ?—In some measure ; but you ought to have a certain number of ambulances, calculated at so many per thousand, in addition, and also for hospital stores.

2636. You say that the surgeon's signature ought to be sufficient for what he requires ?—Yes.

2637. To whom does it go now ?—It was required to go to the divisional medical officer, and in the Crimea to Sir John Hall, who was about 2 or 3 miles further off, and the divisional officer's signature was not sufficient to get the supplies from Balaclava ; but a man had to go those three miles to Sir John Hall's quarters. He might be out of the way ; but if not, he obtained his signature.

2638. With a number of those coming into him from different quarters, he could not know whether they were required or not, or, at all events, not such good means as the man who made the requisition ?—He knew by the divisional officer approving of the requisition ; but three signatures were required, instead of one.

2639. (*Mr. Stafford.*) How far off was the furthest medical officer whose requisitions you had to sign, before they went to Sir John Hall ?—About three quarters of a mile or so.

2640. (*President.*) How would you deal with the requisitions ?—I would consider the regimental surgeon's requisition sufficient for a regiment ; and in the case of the medical officer in charge of the division, I should consider his signature also sufficient for the divisional supplies.

2641. (*Mr. Stafford.*) You would save a mile in one case ?—Yes, and two or three to Sir John Hall, besides, when in the Crimea.

2642. You would save six miles in all ?—Yes, and very often they got nothing, as often Dr. Hall was out of the way, and the man had to come back, but such might not occur again.

2643. (*Dr. Andrew Smith.*) With regard to transport, would there be no danger of some surgeons demanding more conveyance than was necessary, and others not enough ?—If you laid down a certain quantity for a regiment, such you conceived necessary, he could not get more than such regulated allowance on his signature.

2644. Suppose he did not want it all, what then ? Say that you carry 12 or 20 sets of bedding, A and B canteens, marquee, one stretchers, an axe, spade,

and hatchet, &c., those being regulated things ; you will find that one cart will carry all those ; then, in addition, some ambulance for weakly men on the march, and his pannier mule. If that were laid down, he could not get more ; a good light cart and a pannier mule would carry what I have mentioned, besides extras, arrowroot, brandy, tea, and sugar, so that the surgeon would always have at hand some comforts for his sick and could establish a hospital at once when requisite.

2645. Would it not be better that the surgeons should send to the divisional medical officer at once and let him give a general return, and let that return go directly to the director-general of field stores ?—No ; the medical officer in charge of a division might be out of the way, or a sudden movement may have taken place, and they then could not get the transport without his signature.

2646. (*Mr. Martin.*) You are aware that the Intendance in the French service place everything at the disposal of the regimental medical officers, every thing that they require, including carriage ?—Yes, to a certain extent.

2647. Would not an arrangement for the supply of the means of transport for regiments and divisions give another advantage besides, viz., that the transport cattle would be better cared for, it being the interest of both regiments and divisions to be careful of their own cattle ?—Yes, of course.

2648. (*Dr. Andrew Smith.*) What was the system in the Crimea, was it not for the divisional surgeon to send to Sir John Hall ; he approved of the requisition and it was then sent to the assistant quartermaster general, and from that officer it then was sent to the officer in charge of the land transport of the division ?—Yes, at one time ; and look how many signatures were required, and how many miles of ground they went over at times to obtain it.

2649. Would it not be better to send direct from the divisional medical officer for what was required by the medical officers of the division to the director-general of transport, and get it at once, instead of through the quartermaster-general, and through Sir John Hall ?—I merely want it laid down in Her Majesty's regulations that the surgeon being entitled to one cart and one pannier mule, with some ambulance waggons, &c., on his regiment moving, he could send immediately to the officer in charge of transports, and get them at once.

2650. Are you aware that it has been proposed that a small cart shall be attached to each regiment, as a matter of course, and that it is only for the extra conveyance that it is necessary to make a requisition ?—It was not done by general order in the Crimea that I am aware of.

2651. Latterly it was arranged that each regiment should have its own panniers, and that each regiment should have a cart for the medical officer to carry his medical chest, his bedding, and other things in ; and if it turned out that there was too little supply for the regiment, whatever extra conveyance was wanted was to be obtained by the divisional medical officer sending to Sir John Hall, from him to the quartermaster-general, and from the latter to the director-general of the land transport corps, ordering him to supply the whole, or only to supply a portion ?—I do not recollect that those things were done in April 1854, by general orders in the Crimea. I recommended that a battalion should be complete in itself, and in December 1854, that separate transport should be given to the medical department to complete regiments, divisions, &c., also that a hospital staff corps should be raised for orderlies, &c., and a field medical inspector appointed, who would be held responsible for all duties in the field regarding hospitals, camp, ambulances, &c. On the 21st Sept. 1855, six pairs of mule chairs or litters were given over to the land transport of each division to be at the disposal of the principal medical officer of the division.

2652. (*Mr. Stafford.*) When did you leave the Crimea ?—My division had embarked before I left,

*T. Alexander,
Esq., C.B.*
25th May 1857.

some time in June 1856. I was in charge of the light division from the first time that it took the field till it was broken up.

2653. (*President.*) You did not get those supplies to the end?—On 27th February 1856 Sir John Hall and the principal medical officers of divisions met at his hut and went over the matter, and tried to lay down the rule that I am now talking about, viz., what transport we ought to have. I stated then all the weights of the blankets and the bedding, &c. that a cart would carry, and what in my opinion we ought to have; but we never met again on the subject.

2654. You did not get the things?—We never took the field. I recommended this plan in December 1854 to Dr. Smith, besides other arrangements for the field. On 7th March 1856, some ambulances were divided among the divisions, and peace was signed on 30th March.

2655. (*Dr. A. Smith.*) Do you think it would be wise to entrust every surgeon of a regiment, or in the event of a surgeon being absent, every senior assistant surgeon, if he was present, or whoever the medical officer might be when a move is going to take place, with the power of making a demand upon the director general of land transport, or do you think it would not be better to let the divisional medical officer, or the deputy inspector of the division make it, after application had been made by a medical officer to him?—I think it would be better to let the surgeon demand his regulated allowance, and if anything extra was required, then the divisional principal medical officer might do it.

2656. (*President.*) You mean that he would not make that requirement unless it happened that he had been deprived of that which he was entitled to?—Yes, or he might have more sick to carry. If they had a regulated allowance laid down, then the medical officer's signature ought to be sufficient to the officer in charge of the transport for that amount.

2657. (*Dr. Andrew Smith.*) The military authorities were of opinion, that the requisition ought to go to the quartermaster-general. I was averse to that, as it would cause so much longer delay, and I proposed that the divisional medical officer should make a direct application to the transport service; was that the practice, so far as you know, towards the latter part of the campaign in the Crimea?—It had to go to the assistant quartermaster-general of the division, and then to the officer commanding the land transport until 6th September 1855, when it was ordered that requisitions for medical transport should be sent direct to the divisional transport officer after obtaining the signature of the principal medical officer of the division.

2658. (*Mr. Martin.*) I infer from your replies that you consider a regimental medical officer a competent and proper person to make such requisitions?—Decidedly so; I would place that confidence in him that he is entitled to.

2659. With reference to a division, and the check over requisitions and over the regimental surgeon, is it not in your experience that the inspectorial medical officers are very fond of checking and over checking?—Yes.

2660. In a vexatious manner sometimes?—Yes.

2661. (*President.*) When you say that you would trust the regimental surgeon, you would put upon him the responsibility from which he is now relieved, would you not?—He is not now irresponsible, because it is considered that he should look after the comforts of the sick.

2662. Still the responsibility would be much heavier on him if his requisition were taken?—Quite so.

2663. With regard to rations have you not expressed the opinion that the inspections over the regimental surgeons are too frequent and minute?—I think that the first-class staff surgeons going every Monday morning to inspect is not necessary; it causes a bad feeling, not placing sufficient confidence

in the regimental medical officer; it is a sort of school-boy affair. A surgeon, as I was told, marked a quart, and he was found fault with and told to write two pints. If his prescriptions are not written out in Latin in full he is found fault with. I think a regimental surgeon is a man of some considerable standing, and ought to be treated differently, and that there should be confidence placed in him; I have a very high opinion of regimental medical officers.

2664. You hold that the absence of confidence always creates a want of responsibility?—Yes, it annoys, and creates a bad feeling.

2665. (*Sir H. K. Storks.*) At those visits of the inspectors, or first-class staff surgeons, is the treatment of the patients looked into as well as the returns?—Occasionally.

2666. The inspector goes more to inspect the returns than to the treatment of patients?—I consider that inspectorial duties are necessary, but I would not have it laid down that they should go at a certain time, but that they should go in occasionally. I think that treating the medical officers as gentlemen, you would have all the duties done much better.

2667. (*Mr. Martin.*) In the Crimea did not the staff surgeons interfere, as you state, in the presence of the patients, so that the soldiers felt aggrieved at the interference?—I am not aware of that; not in the light division.

2668. (*President.*) A first-class staff surgeon is often junior to a regimental surgeon, is he not?—Yes, occasionally.

2669. Do you consider a first-class staff surgeon to be an administrative or an executive officer?—Generally speaking, he is considered an administrative officer, but also executive.

2670. Does he visit and prescribe?—I think if it was laid down that he was to be an executive officer in a military hospital, to take charge of so many wards, and the probationers and young officers walked round with him, and merely carried out his practice, you would make him a much more useful officer than he is now.

2671. Was not the rank created on a representation made by Mr. Guthrie, that there were not sufficient executive ranks in the army, and too many administrative in proportion?—I believe that was in the field, to look over brigades.

2672. It was originally intended to be an additional executive rank?—Yes.

2673. (*Dr. Andrew Smith.*) With reference to a former answer that you gave, are there not many medical officers in all places who do require strict supervision?—There are medical officers of that description, but I think you make them so because you do not place confidence in them; they become disgusted.

2674. There are a number of officers, are there not, that require to be looked after in the discharge of their duties?—Some men do their duties better than others, but I think that by the inquisitorial system of inspecting so repeatedly, you do not place in them that confidence which they are entitled to.

2675. Have you any evidence of that?—I know that regimental surgeons have frequently complained to me of that kind of treatment in others; it is too inquisitorial.

2676. If there are a certain proportion of medical officers that require to be looked after you cannot possibly make a distinction; you cannot say, here is a surgeon that I must go and look after, but this one I will pass by?—Say, for instance, that you did find a man that did not do his duty properly, it would be very easy for the inspector to go in occasionally: he need not go in each day, but he might walk in as often as he thought proper. I would not treat the majority in such a manner for the few who require it.

2677. Where is he required to go round each day?—He is required to go round once a week, I think at Aldershot.

T. Alexander,
Esq., C.B.

27th May 1857.

2678. (*Mr. Martin.*) And more frequently in the field, is he not?—Some do it every day.

2679. Do you think that in any case the staff-surgeon should prescribe over the regimental surgeon, and that in the presence of the patient?—No; I think it is a want of etiquette if he does so, because it lowers the regimental surgeon in the opinion of the soldier.

2680. (*President.*) That is, if he sees a necessity for correcting his treatment, it ought not to be done in the presence of the patient?—No, but he should take him aside and talk to him more in the way of a consultation.

2681. (*Dr. A. Smith.*) Did you know any staff-surgeons, of the first class, in the Crimea, who were juniors to the regimental surgeons there?—I do not recollect one exactly at this time. I inspected, at Malta and in Turkey, the 28th and 50th regimental hospitals. I think one surgeon had been about 40 years in the service when I was 20. I was first class then; the other surgeon was much longer also in the service than I was.

2682. (*Mr. Martin.*) The thing does happen frequently, does it not?—It does happen.

2683. (*President.*) Is not that the necessary result, if you count seniority by service instead of by rank?—Yes, quite so.

2684. The objection that you make is not that the regimental surgeon resents his being interfered with by a man his junior in the service, but that he is interfered with minutely on points on which he must be the best judge?—Yes, they do it frequently; it is a sort of inquisitorial school; it is too school-boy a proceeding.

2685. (*Dr. Andrew Smith.*) In what way does the staff-surgeon interfere with the regimental-surgeon?—The staff-surgeon goes round, and looks at the diet table, and sees whether it tallies with the register, whether a patient has had too many extras; he looks round the hospitals; and in the case of a regimental surgeon, of some standing, to look over him, and see whether a patient has been given too many extras during the week, is carrying it a little too far.

2686. Is it not frequently the case that the extras are too many?—Yes. It happened to me at Quebec that a first-class staff surgeon made his inspection every Monday morning; I am told that it is the rule regularly now at Aldershot to inspect once a week.

2687. (*Mr. Stafford.*) At question 1193 of the evidence taken before the Select Committee of the House of Commons on the medical department of the army, Dr. Mapleton stated "In the army medical department a surgeon can get an order from a staff surgeon of the first class, from a deputy inspector, or an inspector-general, as to the amount of food that he shall give the patient, as to the amount of medical comforts that he shall give to the patient, and as to the medicines that he shall prescribe for the patient. Now in private life that would not be tolerated; a man would consult in private life, and not be ordered." Do you agree with that?—He can get such an order, but it is not generally done, still it is open to be done, and in private life it would not be tolerated.

2688. You think that objectionable, do you not?—Yes, I do.

2689. (*Dr. Andrew Smith.*) Have you ever known it done in your experience?—Yes; I have myself been found fault with by the principal medical officer, who came round and inspected my books, because I had given too much wine.

2690. Was not that in conversation; he did not tell you that you had done wrong, did he?—It was done in this way. The first-class staff surgeon said to me one morning, "Mr. Alexander, I must examine into your books, you have given a large quantity of wine." I said, "It is too inquisitorial; I have given so and so. I conceived it necessary, and I will pay the amount, if you think it is too much, rather than you should examine into my books, for I think it is inquisitorial and lowering to me." The first-class staff surgeon said "I must obey my orders."

He looked into the books, and after a most minute examination found all the cases registered, and that the diets and extras tallied with the diet table. My assistant-surgeon was present at the time. I remember another case. The inspector-general sent down a memorandum to me at Quebec, that he would at his inspection inquire into the wasteful and extraordinary expenditure of the reserve battalion hospital of the rifle brigade; having totalled up the number of sick, and found the expense of dieting some patients 6*d.*, others, 10*d.*, and others, 1*s.*; mine happened to be 10*d.*; he did not take into consideration for one moment whether these were cases requiring extras or otherwise, but as mine cost 10*d.*, having had a great deal of typhus fever, requiring wine and extras, he issued a memorandum that went through the whole of Canada, calling attention to the extravagant way in which several hospitals were conducted, and remarked that those officers whose patients cost 10*d.* or a 1*s.* either did not understand their duty, or did not attend to it.

2691. Are you aware that those points are exacted in consequence of the exactions made by the War Office upon the medical department, and not in consequence of it being the opinion of the head of the medical department, and the administrative officers serving under him?—No, I am not aware of that. I reported the above home to Sir James Macgregor, and demanded that there should be a stringent inquiry into the same, and that the whole matter should be laid before His Grace the Duke of Wellington, and the answer I received was, that it was better for the service that nothing more should be done in the matter.

2692. (*Mr. Martin.*) In your opinion, supervising the duties of a hospital should be so conducted as to be effective in respect to certain officers, and merely an apparent supervision over the best class officers, and be done in a delicate manner?—Yes, in a gentlemanly manner, dictated by good taste and a knowledge of human nature.

2693. (*Sir H. K. Storks.*) Are there any written instructions issued to the inspecting medical officer?—No published ones unless inspection returns to be filled up, and paragraph 8, page 286, Queen's regulations.

2694. (*Dr. Andrew Smith.*) Does not every principal medical officer on being appointed to a foreign station at the same time receive additional orders to what his predecessor had, and if he does not, he is referred, is he not, to the orders of his predecessor, which are written?—They are written, not published.

2695. (*Mr. Martin.*) Should not this supervision be made a matter of rule in the service, so as to be understood by all classes of officers?—I think so; it ought to be clearly laid down in the printed regulations for medical officers.

2696. And made a matter of rule and regulation?—Yes.

2697. (*Sir H. K. Storks.*) What has the medical officer to guide him on the line of inspection that he is to take?—He has the written instructions of his predecessor, with the forms of inspection; they are not all printed or published.

2698. Written things may be printed, may they not?—Yes, but they are not all published and printed.

2699. (*Dr. Andrew Smith.*) They are not printed, but they are published?—I mean published in the printed book of regulations for hospitals. Unless they are published there the other officers cannot know them.

2700. (*Sir H. K. Storks.*) It is not a departmental order that is issued?—No; it is not published in the regulation book.

2701. Then it is not published?—No, not that I am aware of.

2702. (*Mr. Martin.*) All the parties concerned do not know it?—No; the letters are kept in the office.

2703. (*President.*) It is an instruction to inspect which is not communicated to the inspected?—Quite so. I think that everything regarding the regulations of the service ought to be clearly and distinctly laid down in the published book of instructions.

2704. Is it customary for the army medical officers to be consulted as to sites for camps and hospitals?—No, not customary; I do not know about Netley, but I am speaking generally.

2705. Would they be consulted as to sanitary measures for occupying towns?—No, not necessarily.

2706. Or as to the sanitary state of barracks and general matters affecting the health of the troops?—No, not generally speaking. In my opinion medical officers ought invariably to be consulted about sites for hospitals, barracks, drainage, sewerage, construction, ventilation, and the space allowed to each soldier or patient; also the ground for camps; for strategical purposes certain camps may be necessary. No medical officer would take then upon him to interfere. Still with his sanitary knowledge he could render them much more healthy, by drainage, &c. If permanent the refuse should be burned instead of burying; it would not do to bury if you remained long on the same ground. You must burn all the refuse, otherwise the water and ground would become impregnated, and the site unhealthy.

2707. Is it the duty of a medical officer, whether assistant or not, to make representations to the commanding officer?—I think it is, and that he ought to do so.

2708. With a view to his recommendations being carried out, would you make any regulation that he should make such representation in writing?—It would be better in writing, for then it could be produced afterwards. A great many things are done by conversation. You see the general of your division, and say, such and such a thing ought to be done, and he may act with you or not, as he thinks proper.

2709. If a regulation enacted that the commanding officer should consult the medical man, it might be evaded by his consulting him and then paying no attention to his advice?—Yes, he may laugh at you, unless you place the same in writing; and, should sickness break out, hold him responsible for not following the suggestions of the medical officer.

2710. But if by regulation the medical officer was obliged to give his opinion in writing, it would then stand as a record in case neglect of his advice led to evil consequences?—Yes, quite so; therefore it ought to be written. When I made requisitions about having stores with me at Aladyn, I applied officially to the general commanding in the field, which went to the general of the division, and the answer that came back was that I had better keep my suggestions and strictures until they were asked for.

2711. What were the subjects that were generally included in the representations which you made?—I often represented about the food, the drills, clothing, fuel, and that hospitals and kitchens ought to be built, and men set apart to cook; the sanitary arrangements of the camp; that the cleaning of it should be attended to, and the burying of dead animals. I have also represented about the rations, and everything connected with military hygiene. I think it is the duty of the medical officer to point out his opinions connected with sanitary measures to the officer commanding.

2712. (*Mr. Stafford.*) Were your suggestions generally listened to?—Not always. Eventually they listened to them more than they did at first; but it does not follow that the suggestions of any medical officer are listened to or carried out until the consequences are seen, and then they begin to place more confidence in the opinions of the medical officer.

2713. You think that in all cases no important steps ought to be taken upon which a medical opinion is advisable, before the medical officer has been consulted?—He ought to be consulted invariably on every subject connected with the health of the troops.

2714. With regard to rations?—Yes, with regard to rations and clothing, and accommodation, the

space allowed to each individual, either in hospital or in the barracks; such is not done now. The ordnance department tell off a ward to hold so many patients, or the barrack to hold so many soldiers; the medical men are not consulted on those matters.

2715. You consider that it is the barrack department which settles virtually how many patients should be included in a ward?—They paint it up on the hospital or barrack doors.

2716. Do you consider that the hospitals and barracks are sufficiently ventilated or spacious enough?—No, far from it. There are few hospitals or barracks that I have seen ventilated, save by doors and windows, which, being under the power of the soldiers, I consider as no ventilation whatever.

2717. You think there ought to be artificial ventilation?—Yes, it ought to be carried on in such a way that all went on quite independently of the soldier, and he ought not to have the power of checking or stopping it. And with regard to the site, drainage, sewerage, ventilation, construction, the space allowed, and sanitary arrangements, on all these subjects the medical officer ought to be consulted invariably.

2718. With regard to the ration, have you formed any opinion as to the quality and amount of the ration, and its sufficiency to keep a man in good health?—I think that the present ration, as laid down by the government, is not sufficient to keep a man in perfect health and fit for his duty, and that the government ought to lay down a ration that should be sufficient to keep a soldier in health. You ought not to allow the soldier to have it in his power to purchase this or that, but the government should supply him with vegetables, tea, and sugar, in fact with every requisite to keep him fit for his duties. When you go to the field, you are trusting to the man buying what is *bonâ fide* necessary to keep him in health, and when his services are required he breaks down, because he cannot obtain what is absolutely necessary to enable him to perform his duties.

2719. (*Sir H. K. Storks.*) You know what he gets at home?—Yes.

2720. Do you consider that sufficient for the soldier to keep him in health?—The dieting depends entirely upon the work he is called upon to perform, his exposure and his clothing, and ought to be laid down and varied accordingly.

2721. Take the ordinary work that a man performs, and night exposure, do you think the quantity of food that he gets according to the regulations, sufficient to keep him in health?—No, I think that the ration should be laid down of a sufficient quantity to keep the man in perfect health, and that whatever is requisite should be issued to him as a ration by the government.

2722. (*President.*) Sufficient to give him three meals a day, with such a variety as to counteract the effect of a diet too exclusively meat and bread?—Yes.

2723. Would you introduce a variety of diet, in order to keep him in health, on other grounds?—I would. I would, on salt meat days, issue some peas meal, in lieu of a portion of the pork; and when beef is issued, flour, raisins, and suet, in lieu of a portion of beef. I should bring it, as nearly as possible, to the ration of the navy on those occasions, and have kitchens for roasting, baking, &c.

2724. At present the quantity he gets must depend upon the price of the market at the time?—Yes.

2725. When things are dear he gets less, and when things are cheap he gets more?—Yes, according to the prices of the market.

2726. The stoppage is fixed, but the amount of ration varies with the price in the market?—Yes.

2727. When the prices are low he gets too much, and when they are high he gets too little?—Yes. Besides, the soldier must be fed so as to keep him in health. A man in the Crimea required more, being at first badly clothed and housed, than a man in England would, besides the difference in the qualities of the provisions.

*T. Alexander,
Esq., C.B.
25th May 1857.*

T. Alexander,
Esq., C.B.

29 May 1857.

2728. (*Mr. Martin.*) Are you aware that the Crimean Commissioners recommended an increased scale of diet?—Yes.

2729. Twenty-four ounces of soft bread, 16 ounces of fresh meat, eight ounces of fresh vegetables, two ounces of rice or barley, one ounce of coffee roasted or ground, and two ounces of sugar, one eighth of a pint of spirits, half ounce mustard, quarter ounce pepper, and half ounce salt. Do you approve of that ration for field service?—I do. At Aladyn, in Bulgaria, in June 1854, I mentioned to the general officer that the soldier could not perform his duty, unless he was better fed, and that the then ration was not sufficient. So much so, that I wrote officially to the general commanding, on 27th July 1854, while at Monaster, and recommended that half a pound additional of meat should be included in the daily ration, so that good soup, with rice, pepper and salt, should be had by the men, the meat being of an inferior quality, which $\frac{1}{2}$ lb. was given to the whole army.

2730. Have not increased rations been often demanded more in consequence of the defective cooking of the soldier than as a mere matter of weight, so much being wasted?—Yes, the cooking is very defective. At the same time you require a certain weight to contain the nourishment requisite to keep a man in health, and to enable him to perform his duty.

2731. (*Mr. Stafford.*) Do you think that the soldier should have had as much or more animal food in those climates than in this?—They required more in consequence of the labour which they had to undergo, and the bad quality of the provisions. At the Cape every man consumed easily his pound and a half of meat a day in the field.

2732. (*President.*) In a cold climate the men require a larger amount of animal food, do they not, than in a hot climate?—Yes.

2733. (*Mr. Martin.*) Assuming that the last mentioned ration of the Crimean Commissioners should be received as the standard ration for active service, do you agree with them that a certain equivalent may occasionally be substituted for some of the articles; for example, 16 ounces of biscuit for 24 ounces of soft bread, two ounces of compressed or preserved vegetables for eight ounces of fresh vegetables, and one-third of an ounce of tea for one ounce of coffee?—Yes, that would save your transport. You cannot always have fresh vegetables and you cannot always have fresh bread, so you must have biscuit and preserved vegetables in lieu of them.

2734. Are not mixed diets in all countries found to be best suited, and should not military officers see daily to the freshness and purity of the vegetable and animal diet?—Certainly.

2735. Should not care be taken that the vessels employed in cooking and carrying water be kept in a state of great cleanliness, and should they not be under the supervision of some orderly officer?—Certainly.

2736. Does it appear to you, that a natural order of diet could be fixed and established thus: one scale for the soldier in barracks or cantonments, and another and higher scale for field service?—I think so. I conceive that it is absolutely necessary to issue in the field more than in cantonments, they having more work to do consequently require more food.

2737. Is it not very desirable that the labour value of the several diets should also be observed?—Quite so. You may lay down exactly what is requisite to keep a man in health, according to the proportion of the labour he has to perform. Then cooking is too little attended to, and ought to be much improved.

2738. Should there not be in every regiment two practised cooks to teach the young soldier?—Yes, there ought; and cooks should be set apart especially for that purpose.

2739. Referring to your answer in which you stated, that it is the duty of the medical officer to state his opinions to his commanding officer upon all

sanitary questions, do commanding officers generally apprehend and acknowledge this obligation and duty on the part of the surgeon?—They are not fond of it, and they do not act upon it very often.

2740. Is it not the practice in the service?—They do not consider that they are bound to carry out what the surgeon or medical officer recommends.

2741. (*President.*) Has it ever occurred to you that in issuing salt meat for the army, salted as it is for the navy, you might issue corned meat which would be far more wholesome?—Yes, it would be far more wholesome and preferable.

2742. You do not require for army purposes to keep it as long as you do in the navy?—No, it would be better if it were salted less.

2743. Slightly salted meat would answer all the purposes for the army?—Yes.

2744. Do you prefer malt liquor or spirits as a ration?—Malt liquor.

2745. But it is not portable enough?—No, that is the difficulty.

2746. Take the case on board ship, they issue a dram to a man, do they not?—I think that the spirit ration on board ship is a bad principle, because in a long voyage you thereby engender such tastes in a young soldier that he may eventually become a confirmed drunkard.

2747. Do you consider that it is necessary for his health on board ship?—No.

2748. Is it more necessary on board ship than on land that he should have a dram?—No, I do not think so.

2749. You would abolish the spirit ration on board ship?—I would.

2750. Are there not a great multiplicity of stoppages at present for rations and food in the army?—There are a variety of stoppages made. A man is charged in the hospital so much; if he is wounded, he is charged so much less; if he is on board ship, he is charged so much; and if he takes spirits on board ship, he is charged so much more.

2751. Suppose you adopted a plan by which you supplied a complete ration, equal to providing a man with three meals, which would keep him in perfect health, would you make one uniform stoppage under all circumstances, except in hospital and at home?—Yes; I think that the government would save greatly by doing away with an immense deal of clerks' work in looking over these rations, were a fixed price laid down for rations on all occasions, in or out of hospitals.

2752. Was this the course of the stoppages at the commencement of the war, that the men left England being on $4\frac{1}{2}d.$, and that they then had $5d.$ on board?—Sixpence if they took spirits.

2753. Then $3\frac{1}{2}d.$ when they arrived at Bulgaria, and it was subsequently raised by Lord Raglan in order to give them other supplies, and then they fell back on the original sum?—Yes; I believe so.

2754. Did it come under your cognizance that that led to great confusion in the accounts?—Yes; I have heard so.

2755. Ultimately the men were very much dissatisfied with the rough settlement which it was necessary to make with them?—I have heard so.

2756. You say that the ration could be improved in variety; can you improve the ration materially without improving the cooking?—Both are requisite; the cooking ought to have far more attention paid to it.

2757. If you could introduce different modes of cooking, you would get variety with the same material?—Yes.

2758. That is possible, is it not, in barracks and in hospitals?—Yes; by improving the kitchens.

2759. Is it possible in the field?—In the field I think that Soyer's camp-cooking stoves would be most valuable, more particularly if you are going through a country where fuel is scarce, because one or two men in a company could cook for a whole company, or a few men for a whole battalion, by placing the stoves in a row. In the Crimea a few men latterly

did the whole cooking for a regiment with Soyer's stoves.

2760. Are Soyer's stoves more portable than the coppers?—Yes, a mule carries the whole. It would have been invaluable at the Cape, we had sometimes to burn cowdung for want of fuel; with those stoves you carry portable fuel to a certain amount on one mule with them.

2761. In a regimental hospital at home, could you introduce the means of giving a variety of cooking?—Quite so; I think that the kitchen ranges should be so adapted, that you could vary the food by roasting, baking, or stewing, so as to vary the diets occasionally.

2762. At present, every man in the camp cooks for himself, does he not?—They cook by companies or in squads, but frequently for themselves.

2763. (*Mr. Stafford.*) They take it by turns?—Yes, I believe so.

2764. (*President.*) Have you any suggestions to make with regard to the tents?—I think that tents ought invariably to be carried in certain proportions, for one or two nights lying down in the cold might render many men quite hors de combat.

2765. Would you prefer the French tentes d'abri?—No, unless for rapid marches; I think that our bell tent is better; the Turkish material is better, and not so likely to shrink; their tent has a broader base and is not so high.

2766. (*Mr. Stafford.*) Does it turn the wet as well?—Yes, I believe so. As a proof of that, by having a broader base, an immense number of those tents in the storm of the 14th November 1854 stood while ours were blown down.

2767. Is there not a great waste of space inside from the slanting sides?—I do not think so; they have a broader base.

2768. For some distance from the base they are so low that a man cannot get into them, can he?—I do not think so. It is less liable to be overthrown, and I think that the curtain walls are rather deeper than ours.

2769. For hospital tents what do you recommend?—Tents will never do for hospitals; marquees are the best.

2770. (*Sir H. K. Storks.*) Is the regulation hospital marquee good?—Very good indeed for field-work.

2771. (*Mr. Martin.*) But the bell tents are the worst, you think?—Nothing could be worse for sick men than a bell tent.

2772. (*Dr. Andrew Smith.*) Do you think that the common bell tent single is calculated to maintain a man in health, does not the rain get through it?—When it is worn a little it does; but if you were to double it you could not carry it any distance inland, you would require such an amount of transport.

2773. (*President.*) Have you any suggestion to make on the subject of clothing?—It should be varied according to the station or climate that the soldier

goes to. The clothing now is made of a much better material, and the tunic is far preferable to the old coatee.

2774. And much less tight?—Yes; but it is too tight now, and in consequence the men throw open their coats, and then they get chilled. Flannel shirts are, I think, far better than the shirts which they now use. I would make the soldier wear flannel continually. I would have no stock. I have seen the men drop down with the heat; it ought not to be like a hoop of iron, but it ought to be soft leather if worn. When the 60th regiment were marching into King William's Town, in Kaffraria, across the race course on a broiling hot day, the men were ordered to put on their stocks, and many fell down before they went many yards. I would have the collar of the tunic so fitted as to require no stock.

2775. Have you any suggestion to make with regard to the head-dress?—I think the shako far too heavy, and it is uncomfortable for the field; so much so, that the men invariably throw them away.

2776. (*Sir H. K. Storks.*) Do not you think that the forage cap is a very bad one?—I do not think that it covers the head sufficiently.

2777. There is no protection for the eyes?—No, and no protection to the back of the head; there is great room for improvement in the head dress.

2778. (*President.*) Would you give them a peak or not?—I have heard officers state that the men preferred them without the peak. The French peak is far preferable to ours, and shades the soldier much better. I much prefer it.

2779. (*Dr. Andrew Smith.*) Do you think that the flannel shirt by itself is always to be preferred?—Yes.

2780. Would you make it the only shirt to be worn, and get rid of the cotton one?—Yes. You will find that in the field both officers and men prefer it. I do not see why flannel could not be washed as well as any other material, and always worn.

2781. (*Mr. Martin.*) Do you think it of very great importance, that the purity of the water used for cooking and other purposes should be attended to by the commanding officer?—Yes, it ought certainly to be covered and protected, and we did that eventually in the Crimea. It was so muddled, that we had to build around the stream from which it came to the tank.

2782. You consider that no labour or expense should be spared to secure its purity?—None.

2783. And in standing camps and cantonments, it should be conveyed by iron tubes?—Yes, by tubes of some sort; if you could get iron, so much the better.

2784. And that from a source remote from contamination?—Yes.

2785. What quantity of water should you consider necessary for the daily use of the soldier, including his own purposes and the barrack attendants?—From eight to ten gallons would be sufficient for all purposes for a soldier, cooking, ablution, &c.

GEORGE BROWN, Esq., examined.

2786. (*President.*) You are surgeon major of the Grenadier Guards?—Yes.

2787. How long have you served?—For 32 years.

2788. Have you served in the line as well as in the Guards?—Yes, in the 43d and in the 18th regiments.

2789. Have you served abroad?—Yes, at Gibraltar, in Portugal, and in Canada.

2790. Were you with the Guards in Portugal?—No, I was in the 43d.

2791. Were you with the Guards in Canada?—Yes.

2792. Therefore you have seen a good deal of the duties of a medical officer at home and abroad, and you know the difference between the practice in the line and in the Guards?—Yes, I do.

2793. (*Mr. Stafford.*) Were you in the Crimea?—No.

2794. (*President.*) Do the medical officers of the Guards pass any examination upon entry?—They do.

2795. Is that a distinct examination from the one in the line?—No, it is the same as in the army medical department.

2796. Do you think that examination is best made within the department, or would you prefer seeing it made by a body of examiners unconnected with the army?—I should like to see it made by a body unconnected with the army altogether, the same as is done now in the civil service and in the East India Company's service.

2797. And in the army also, I think?—I mean the East Indian army.

2798. Why do you think that is the better plan?—I think the examiners ought to be lecturers, who

*T. Alexander,
Esq., C.B.*

25th May 1857.

G. Brown, Esq.

25th May 1857.

G. Brown, Esq. are more competent, in my opinion, for this duty than persons unaccustomed to teach.

2799. You mean men who have been habitually examiners?—Yes, such as at the London University; there is a faculty of medicine there, and they might be examined in every branch of the profession by regular examiners.

2800. Do you think it is of service to exact from a candidate a diploma of medical as well as of his surgical knowledge?—Not exactly. I think either the one or the other should be insisted upon, but it would be much better to have them both.

2801. At present you require a diploma from the College of Surgeons, but not a medical diploma?—I believe not.

2802. Is not the greater amount of cases which are treated in the army, medical rather than surgical?—By far the most.

2803. In point of fact army surgeons are general practitioners?—Yes.

2804. Do you think it is advisable to require upon the first examination for admission any knowledge of military hygiene?—No. I should think they would acquire that better afterwards if there was any large military hospital, such as Chatham or the proposed new establishment at Netley, where it could be systematically taught.

2805. You do not attach much importance to the two chairs of military surgery at Edinburgh and Dublin?—No, I do not; I think the instruction would be better given in an army hospital than there.

2806. You would like to transfer those chairs to the army hospital?—I should think so; there are many men in the service perfectly equal to that duty.

2807. Would it, in your opinion, be advisable to have any second examination of army medical officers after they have been assistant-surgeons in the service?—I should think it would be advantageous, and it was done at one time. I was examined myself.

2808. Why was it discontinued?—I do not know that it is. When I was in Gibraltar the whole of us were examined.

2809. Did that create any dissatisfaction?—They did not like it, certainly.

2810. Does anybody like an examination?—I do not know that they do. We did not think we were so much the better for it after it was over. There is one thing I may mention, that the principal medical officer at Gibraltar was considered rather a tight hand.

2811. (*Mr. Martin.*) Was that examination preliminary to promotion?—No; it was an order that came out, that all medical officers were to be examined periodically.

2812. (*Sir H. K. Storks.*) In what year was that?—It was in the year 1826.

2813. (*President.*) The examination, I presume, was conducted by some officers on the station?—In the garrison Dr. Hennen was the inspector, and there was Mr. Hill, a staff surgeon, and the senior regimental surgeon, Mr. Macleod, of the 42nd.

2814. As the examination was conducted by officers on the stations in all parts of the world, there was no security that the examination did not differ very much in one place and in another?—No.

2815. Would not that be in itself a cause of dissatisfaction?—It might be so.

2816. It would be a cause of dissatisfaction, would it not?—It would.

2817. (*Mr. Alexander.*) That was while you were an assistant-surgeon?—Yes.

2818. You did not undergo a second examination?—No. They were to be periodical; they have been so since, as far as I know, but the order came out then.

2819. (*President.*) In the Guards I believe you have a different system of keeping accounts from that which prevails in the line?—Yes, we provide all our own diets.

2820. Will you explain your system? Do you, as medical officer, keep the accounts?—No, I have nothing to do with them.

2821. Who has to do with them?—The person who has most to do with them is the hospital steward and the quarter-master, who is also acting paymaster; they are the people who look after the accounts.

2822. Who provides for the hospital?—The hospital steward and the quarter-master.

2823. Who makes the contracts?—The commanding officer, and it is done by tender.

2824. The hospital steward, I presume, brings to him the contract that he proposes to make?—The quarter-master does so.

2825. You have had nothing to do with the accounts?—No.

2826. Are the diet-rolls made out in the same way in the Guards as in the line?—In much the same way in the Guards as in the line.

2827. Do you make the nominal diet-roll every day?—No, the steward does that.

2828. Does he make a fresh nominal roll every day?—No, it is carried on for a week.

2829. Who is the steward?—He was a serjeant; an old pay-serjeant when we got him.

2830. (*Dr. A. Smith.*) He is not a hospital serjeant, is he?—Yes, he is; he is called hospital steward.

2831. (*Mr. Martin.*) Is he under the purveyor or the commissary?—There is no purveyor or commissary.

2832. (*President.*) He is the hospital steward, and combines the duties of hospital serjeant and purveyor?—Yes.

2833. (*Mr. Stafford.*) In speaking of the hospital of the Grenadier Guards, do you speak also of the Fusiliers and Coldstreams?—Yes, the whole three; they are very much the same.

2834. (*President.*) This system relieves, does it not, the medical officer from a great deal of writing and accounts which are required in the line?—Yes, it does.

2835. And leaves you more time for your other duties?—Yes.

2836. Are there any disadvantages arising from that system?—Not that I am aware of; I have been now 25 years in the brigade, and I have never known of any.

2837. Does the steward supply everything that you order?—Yes, everything that I order.

2838. Without question or difficulty?—Yes.

2839. (*Mr. Stafford.*) Practically there is no limit as to your diet?—There is a regular hospital diet, but we can give what extras we please, as extras; there is a diet that is not given in any other branches of the army—a fish diet, which we find extremely useful in many cases.

2840. Practically there is no limit?—No limit whatever.

2841. You have never got into any difficulty by ordering that diet?—No; I never knew a medical officer get into a difficulty since I have been in the brigade.

2842. (*Dr. A. Smith.*) Who pays for the diet?—It is paid by the regiment, I believe, from the allowance which is granted to defray the recruiting and hospital expenses.

2843. (*President.*) Is there not an allowance of so much per man for the expenses of hospital and recruiting?—Yes.

2844. What check is there upon the steward?—The only check as to the diets is my inspection of the diet-rolls; the accounts are received every week, and entered in a book kept by the paymaster.

2845. You sign the diet-roll, do you not?—No, I examine the book. This is a copy of the weekly diet-roll (*handing in the same*), and this is a copy of the weekly account (*handing in the same*).

2846. (*Mr. Martin.*) The paymaster is the auditor, and he audits at the end of every seven days?—Yes, and at the end of every month there is a board of officers, and they audit the monthly accounts.

2847. (*President.*) Has there been an instance of peculation or defalcation?—No, I have never detected

one; the only case of irregularity that I have ever heard of was in the case of a man who was found to have taken a per-centage from a tradesman, but it was I suppose more the tradesman's fault than the man's.

2848. Do you know at all what the expense of your hospital is per man?—No.

2849. You do not know the cost of your diet per day?—No.

2850. Is it more expensive than in the line hospitals?—I should think it is, rather; there is probably more variety of diet, and the servants are better paid.

2851. Your non-commissioned officers are rather of a superior class in the Guards, are they not?—They are generally, those that get up to that rank.

2852. Take the case of the line; do you think that you could get in the line non-commissioned officers who could execute those duties as well as in the Guards?—Yes.

2853. You do not think it is on account of the advantage you have in getting non-commissioned officers of a higher class that you are enabled to carry this system into effect?—No; I think there are as good non-commissioned officers in the line as there are in the Guards.

2854. (*Mr. Stafford.*) Have you read the evidence of John Jackson, given before a committee of the House of Commons of last year?—I have.

2855. Do you agree generally with that?—Perfectly; the man was 15 years under my own eye.

2856. (*Mr. Martin.*) Have you not a larger proportion of non-commissioned officers in the battalions of the Foot Guards than in the regiments of the line?—No, I am not aware that we have.

2857. (*Sir H. K. Storks.*) Have you four serjeants and a colour serjeant to each company?—Yes, I believe so.

2858. (*President.*) What do you give to your hospital-serjeant?—He gets 13s. a week.

2859. What is that in the way of addition to his pay in the ranks?—It is not two shillings a day.

2860. In the line they only give 4d. a day additional?—It is increased, I think.

2861. If a hospital-serjeant in the line received as large pay as your hospital-serjeant does, you think from your knowledge of the army that they can get as good men?—Yes, I think so.

2862. In your opinion the situation of a hospital-serjeant is a very important one?—Yes.

2863. What should you say was its importance relatively to the staff-serjeant?—I should say that it ought to be made equal to it.

2864. And he ought to be paid as well?—Yes; the hospital serjeant's pay is lower.

2865. (*Mr. Stafford.*) Are there any advantages to counterbalance that lower pay?—Not that I am aware of; he has a small room to himself in the hospital.

2866. (*Sir H. K. Storks.*) Besides that, his duties are not of that fatiguing and responsible nature?—No.

2867. Do you consider that the duties of the hospital-serjeant are of as responsible and laborious a nature as those of the serjeant-major and quarter-master serjeant?—I should say that they are probably not so laborious.

2868. Are they as responsible?—Yes, I certainly think so.

2869. You are thoroughly acquainted with the duties of the serjeant-major and the quarter-master?—Yes; I have known them for a good many years.

2870. (*Mr. Stafford.*) What number of orderlies do you have?—We have generally probably one to every 10 men or 12 men.

2871. Are they taken away at the pleasure of the commanding officer, or are they permanent?—Permanent I should say; I never knew one taken away.

2872. (*President.*) You have a non-commissioned officer to compound and dispense medicines?—Yes. *G. Brown, Esq.*

2873. Do you agree with the statement made by Mr. Jackson on that subject?—Yes, I do. *25th May 1857.*

2874. It answered well?—We have always found it do so.

2875. Have you any difficulty in finding a suitable person for that post when it becomes vacant?—No.

2876. Do you keep a second in training?—Yes, we do.

2877. Is the permanent non-commissioned officer allowed extra pay for that?—He is allowed hospital pay; he gets 5s. a week.

2878. Would it be advantageous to relieve the medical officer from irksome duties, such as dispensing medicines?—Yes, I think so.

2879. Do you think that duty so important that it ought to be performed by a medical officer?—No; I always found we got on very well, and often better.

2880. Where there is a good deal of sickness prevalent, a medical officer in the line does not dispense medicines?—I am not aware; when I was in it we never did; the serjeant always did it.

2881. (*Mr. Martin.*) Had you nothing to do with the compounding and dispensing medicines during your service in the line and in the Guards?—I ought to have had in the line, because it was the order, but I had not, but I was the responsible person.

2882. You consider it desirable that the medical officer should be relieved from such duties?—Most decidedly.

2883. (*President.*) It has been stated that much time is consumed in the line in entering every disease in the register; is that the practice in the Guards?—No, it is not.

2884. Then what record have you of the disease of each man who is admitted?—We have a medical register of cases of any interest, but a great number of them it is not necessary to put into the register. We have a record book in which we keep them, of which I have a copy here (*producing the same, see Appendix No. LXXIV.*)

2885. (*Mr. Alexander.*) Is that a kind of admission and discharge book?—No.

2886. (*President.*) Have you got one book in which you merely enter the admission and discharge, and nature of the disease with which a man comes in?—Yes, that is a different book altogether.

2887. Then in your record you enter cases which are considered important?—Every time that a man is admitted into the hospital his admission is entered in the record book.

2888. Do you enter opposite to a man's name his promotion, and every time he has been in prison?—Yes.

2889. What is the object of that?—Because, when a man is discharged, it is necessary to state what the cause of his disability is.

2890. Who executes that duty of entering promotions and imprisonments?—We have that from the orderly room. We send to the orderly room and get it put in there.

2891. In this document I see that there is nothing but the simple entry of a man's name, and the nature of his disease, but no medical observation at all?—None at all. We have the case in the medical register, if it is a case of interest.

2892. Ordinary cases you do not enter in it?—No, we do not.

2893. Does that register in which you enter the interesting cases, become of any use afterwards?—Yes, we have often to refer to it before we can discharge a man.

2894. Is it useful for medical and scientific purposes?—I should think not.

2895. Why not?—Because the cases are not of much interest.

2896. Upon foreign service would that be the case?—I do not exactly see how it could be useful in that way.

2897. For the purpose of the discharge of your men the record book is considered sufficient?—Yes, it is.

G. Brown, Esq.

25th May 1857.

2898. You derive advantage, I suppose, in judging of a man's disability, from knowing what his habits have been, as shown by the defaulter's book?—Yes, it is of very great assistance in filling up the discharge paper, because we can state at once how far a man's irregularities have had to do with his disabilities.

2899. Does not this record book involve additional writing?—Yes, it does, but not much.

2900. It is not done by you?—No, it is not.

2901. Everything is done by the serjeant?—Yes, or some one else; he will get probably some one else to do it.

2902. (*Mr. Stafford.*) Who is the somebody else?—He will probably get a non-commissioned officer to do it.

2903. (*Sir H. K. Storks.*) Or an orderly clerk?—They have generally too much to do.

2904. (*President.*) It is filled up in the orderly room, is it not?—It is all extracted from the defaulter's book.

2905. You have paid some attention to the forms of the returns, and to the classification of diseases, are you satisfied with the arrangements, or are they capable of being improved?—I should say that they are capable of being improved. I should prefer the registrar-general's classification.

2906. For what reason?—Because I think it is more simple, and it is the same as is done all over England now.

2907. The nomenclature was adopted at the Brussels conference, was it not?—I am not aware, but I think it would be far better to assimilate the military with the other returns of causes of death, because they are the same in both.

2908. (*Mr. Martin.*) Within the United Kingdom the causes of death are the same in both?—Yes. But in the registrar-general's returns they also put in yellow fever and such diseases.

2909. (*President.*) Is it important for a system of general registration that the deaths of all persons should be recorded, and that it should not be confined to persons in civil life, and those who die in England?—I think it would be an improvement.

2910. If you could communicate the result of military medical statistics to the registrar-general, it would be desirable?—Yes, I should think so.

2911. There is no term in the army nomenclature corresponding to that of alcoholismus?—No; but there is a great deal of the disease.

2912. And it goes down under other heads?—Yes, very often.

2913. (*Mr. Martin.*) You appear to have fewer returns in the Guards, as compared with the regiments of the line?—Yes, we have.

2914. Does it fall within your recollection that the medical officers of the line have been overlaid with the preparation of returns?—Yes, it used occasionally to happen, but not so much now as it used to be; they used to complain that it was a very troublesome thing.

2915. (*Mr. Alexander.*) They could be simplified and condensed, could they not?—I should think so.

2916. (*Sir H. K. Storks.*) What do your men get to eat in barracks?—They get the usual military ration.

2917. Three quarters of a pound of meat and a pound of bread?—Yes.

2918. What else?—And vegetables.

2919. Do they buy that themselves?—Yes, as the line do.

2920. Do you know the quantities?—No; that depends upon the state of the markets.

2921. Have they an evening meal?—Yes.

2922. (*Mr. Martin.*) A supper?—Yes.

2923. (*President.*) Some years ago they had only one meal?—Yes, but now they are like the line.

2924. Do you recollect when the change was made from one meal to two?—I do not recollect.

2925. How did the men live then?—They used to live in public-houses.

2926. How did they manage?—They have always had coffee for breakfast since I have been in the service, now they have three meals.

2927. Do you know what the full amount of stoppage is in the guards, including messing and washing?—No.

2928. (*Sir H. K. Storks.*) Do you consider that the men get enough to eat?—I think they ought to have a full pound of meat; the meat they get is both young and lean.

2929. Considering the duties that a soldier in the Guards has to perform, and his exposure in the discharge of those duties, you do not think that he has sufficient food?—I do not think he has, and the cooking is abominable.

2930. How is it cooked?—It is cooked in the same way from the time the man enters the regiment till he goes out; it is beef and bouilli one day, and bouilli and beef the next day for 21 years.

2931. (*President.*) The want of variety wearies a man?—There is no doubt about it.

2932. (*Mr. Martin.*) It is injurious also on account of its sameness?—Yes, and they do not eat it.

2933. (*President.*) Why not?—I do not know; but I have gone into the barrack-room at nine or ten o'clock at night, and I have seen half a dozen basins of soup not touched; the men would not eat it.

2934. Does not that look as if the ration was sufficient?—The men cannot take it; it goes against their stomach.

2935. (*Mr. Martin.*) Is it owing to improper cooking?—Yes.

2936. (*President.*) You are surgeon-major of a regiment consisting of three battalions?—Yes.

2937. Therefore it is similar to a brigade?—Yes.

2938. Is the surgeon-major an administrative officer or an executive officer?—He is both, but his principal duty is executive. There is no doubt of it; as he has charge of a battalion.

2939. (*Sir H. K. Storks.*) You discharge the duties of surgeon of the battalion?—I discharge the same duties now that I did when I first entered the service; the very same.

2940. (*President.*) Would it be an advantage at your rank that you should have comparatively no medical duty to perform, but that you should be confined to the administrative duty of superintending the hospital?—That would be a farce, I think, altogether; there would be nothing to do.

2941. Do not you think that you are more capable of exercising the executive duties of a medical officer than you were when you were a young man?—Yes, with my experience it would be quite a different thing; otherwise it is getting very irksome.

2942. (*Mr. Stafford.*) What is getting very irksome?—The duties.

2943. More so than they were?—Yes; of course the older a person gets the more irksome they become.

2944. (*Chairman.*) You heard some questions put a short time back with regard to the clothing and the stocks of the soldiers; has anything come under your notice with regard to the clothing that you can suggest?—I certainly should agree with Mr. Alexander that the soldiers ought always to have flannel shirts, and likewise that the stocks should be done away with if possible.

2945. (*Sir H. K. Storks.*) What would you put round their necks?—I do not know that you want anything but his shirt collar under the coat.

2946. (*President.*) Have you seen any bad effects resulting from the use of stiff stocks at Chobham, for instance?—Yes, often I have seen men falling out.

2947. For what reason?—The men could not breathe; they were almost suffocated.

2948. Was that from carrying a very heavy knapsack?—Yes, but the stock is always the first thing they take off.

2949. When it is taken off do the men then go on all right?—Yes, on the line of march a man takes it off and carries it.

2950. (*Mr. Alexander.*) If a man drops down with his stock on, if it is removed he is up immediately?—Yes; I saw one of the most heart-rending things in Portugal. We lost in little more than half a mile five men, who dropped down dead in the ranks.

2951. (*President.*) That was not, I presume, from the stock alone?—No; but it was part of it.

2952. Do you think that the stock contributed much to it?—Yes.

2953. If it was light, and not too high, you would have no objection to it?—None.

2954. (*Sir H. K. Storks.*) You see no objection to a horsehair stock?—None.

2955. (*Mr. Stafford.*) Are you satisfied with the way in which the knapsack is fastened on?—No; but I do not know how it is to be remedied. I am certainly not satisfied with it; the breast strap is always the thing that confines the respiration of the men.

2956. (*President.*) Do you know anything of Ber-
rington's knapsack?—No, I do not.

2957. (*President.*) The knapsack is fitted inside with a wooden frame, is it not, to keep it in shape?—Yes.

2958. Does not that add to the disagreeableness of carrying it?—Yes, it must do so.

2959. Do you know the French knapsack?—No, I do not.

2960. You say that the perpetual monotony of the diet is objectionable?—Very much so.

2961. That is a monotony in the material of the ration, to begin with?—Yes; but the cooking is more objectionable.

2962. Have you ever tried to remedy that in the Guards?—Yes.

2963. How?—One summer I was at Windsor, and we found out an old oven there that had not been in use for many years, and we set it going, and we used to bake meat there all the rest of the time we were there.

2964. Did you bake bread there?—Yes, the women baked the bread; we also got up Irish stews.

2965. Did you succeed in that?—Very well.

2966. (*Mr. Martin.*) And the men were pleased with that change?—Yes, they were quite delighted.

2967. (*President.*) Were the men the better for it?—I do not know; I could not exactly trace that.

2968. How long had you that in use?—Nearly five months.

2969. Why was it given up?—We left, and came up to London.

2970. And the battalion that followed you did not adopt it, I suppose?—I do not know. We have got ovens in the Wellington barracks.

2971. Do you give the men roast as well as boiled meat?—I presume they do so, but our people are not there. I know that the ovens are heated very often.

2972. (*Mr. Stafford.*) What number of men have you at present in London?—There are four battalions, 2,800 men.

2973. Do you think that your list in the hospital is larger or smaller than the usual average?—The Grenadier Guards have only 700 rank and file in London just now.

2974. It appears that there are 55 in hospital?—I do not think that is correct; it is 35. I should say that there are 5 per cent. in the hospital to-day of the battalion in town.

2975. Is that larger or smaller than the average number?—I should say the average.

2976. What do you find the men in the hospital? *G. Brown, Esq.*
Do you find them bedding and body-linen?—No; they use their own body linen. We have got a certain number of hospital shirts, which belong to the hospital, that we use when it is necessary to give a man a shirt when his own is dirty. For the men coming home from the Crimea we were obliged to find shirts the moment they came; they were covered with vermin.

25th May 1857.

2977. (*Mr. Alexander.*) Your men do not put aside their packs?—No, we have no hospital dress.

2978. (*Sir H. K. Storks.*) Then a man wears his uniform?—Yes.

2979. (*Mr. Stafford.*) Have they any dressing gown?—Yes; they have in each ward about two dressing gowns.

2980. (*Mr. Alexander.*) Would it not be advisable to allow hospital dresses to be worn, and put the packs into the pack store?—Yes.

2981. You would prefer that the hospital should supply everything requisite for the soldier?—Yes.

2982. And his pack to be put aside?—Yes.

2983. (*Dr. A. Smith.*) Would you give the soldier a flannel shirt summer and winter, as the regular shirt of the men?—I would.

2984. Both in the ranks and in the hospital?—I would always have cotton shirts for the hospital, in cases of fever, in preference to linen.

2985. (*Mr. Stafford.*) How is the washing done?—It is done by the new apparatus in Wellington barracks, which is one of the greatest improvements I have seen for many a day.

2986. (*President.*) Is it done in your own laundry?—The laundry belongs to the government, and the washing is done in it for all the troops in London, and for those at Windsor.

2987. Do you wash for any other troops at Windsor, besides the guards?—Yes, they wash for any one; it is under the charge of the barrack-master.

2988. Is it done by hired labour?—Yes, he has labourers there.

2989. Does he make a charge to each regiment?—No; he does not make a charge to the regiments of the line, but he makes us pay, because the regiment had to pay for washing before.

2990. So does the line pay, every man pays so much a day?—That is personal washing, I thought you meant the barrack washing; a soldier for his personal washing is charged 4d. a week.

2991. (*Mr. Stafford.*) What drinking or eating vessels have you in your hospital?—The greater number of our vessels are pewter, and a few block tin.

2992. How many do you allow to each patient?—There are plates and cups.

2993. Two cups?—No, not to each patient.

2994. (*President.*) Is it a tin cup or crockery?—Tin.

2995. Have you no crockery?—We have crockery too, but most of them are tin.

2996. Do they drink their coffee and tea in a mug or in a tin?—The worst cases generally in mugs and the others in tins.

2997. (*Mr. Stafford.*) In what do you administer the medicines?—In glass.

2998. (*Mr. Alexander.*) You would prefer a flannel shirt both at home and on foreign service?—Yes.

2999. Always?—I think so.

The witness withdrew.

Adjourned to Friday next at One o'clock.

Friday, 29th May 1857.

PRESENT :

The Right Honourable SIDNEY HERBERT, M.P.
A. S. STAFFORD, Esq., M.P.
Col. Sir H. K. STORKS, K.C.B.
Dr. ANDREW SMITH.

T. ALEXANDER, Esq., C.B.
Sir JAMES CLARK, Bart.
J. R. MARTIN, Esq., F.R.S.
Dr. JOHN SUTHERLAND.

PRESIDENT, The Right Honourable SIDNEY HERBERT, M.P.

Major-General Sir RICHARD AIREY, K.C.B., examined.

Major-General
Sir R. Airey,
K.C.B.

29 May 1857.

3000. (*President.*) You are quartermaster-general of the army, are you not?—Yes.

3001. You have the general control in providing accommodation for the soldiers both in barrack and hospital?—The quartermaster-general has no control whatever over the providing of quarters, nor can he exercise any control even in the appropriation of barracks and hospitals; that was all done formerly by the Ordnance Department, and is now done by the War Department. Every room is marked by the engineer department for a certain number of men which they apportion, and the quartermaster-general has nothing more to do than to occupy them according to the appropriation made by that department.

3002. You merely say what barracks shall be occupied by what regiments?—Yes.

3003. You have no veto upon the amount of accommodation given within those barracks?—Yes. I may represent that the barracks are too confined for the number for which they have been appropriated.

3004. To whom do you represent that?—To the Minister for War.

3005. Have you often occasion to do that?—Very often.

3006. What is the result of your remonstrances?—If possible the appropriation is diminished; but latterly there has been such a pressure upon the question of billeting the troops, they have been very much crowded; and an excess of occupation has occurred with a view to avoid the greater evil of billeting.

3007. Great objection is made to the system of billeting in the towns where they are billeted?—Yes.

3008. You avoid that, do you not, wherever you can?—Yes.

3009. Is it often that you are obliged to have recourse to that, except with troops on the march?—Yes; latterly we have had recourse to it to a very great extent; that is, previously to the disembodiment of the militia, billeting was carried to a very great extent, and representations were made from all parts of the Kingdom.

3010. Now that the militia is disembodied you have no more recourse to it than you had previously to the war?—None. Since the establishment of the great camps at Aldershot, Shorncliffe, and Colchester we have had no troops billeted.

3011. Do you often receive complaints that a greater number of men are put into a room in barracks than is permitted by the regulation?—No, that seldom occurs, because if a room is appropriated for 12 men there is only barrack furniture for that number of men put in, and therefore the commanding officer cannot by himself put more men into a barrack room than is authorized.

3012. Could not the commanding officer, for the sake of getting increased accommodation for some non-commissioned officers, crowd one room for the benefit of another?—He might do it, but it would be assuming a responsibility which he had no right to assume.

3013. Does not the thing occur?—I should say only as an exception.

3014. Have you ever heard of it in the guards?—Yes.

3015. You have no control over them?—No. It might happen also in individual cases in the line that the commanding officer might put more men in a room in order to provide accommodation for the serjeants or married men.

3016. In selecting sites for barracks and hospitals, is it usual to consult the medical officer in charge of the troops as to the probable healthiness of the site?—For barracks scarcely ever, but for hospitals latterly within the last three or four years it has almost always been done.

3017. For example, in the case of Netley the medical officers were consulted, were they not?—Yes.

3018. Was it done beforehand?—Yes. In the last three or four years the medical officers have been consulted with regard to hospitals only.

3019. (*Mr. Stafford.*) Were the medical officers consulted previously to the purchase of the site for Netley?—I believe not.

3020. The site was purchased before the medical officers were consulted?—I do not think that the construction of the hospital at Netley went through any military medium at all; it was done, I believe, entirely by the War Department.

3021. (*President.*) Is there any standing order or regulation making it necessary to consult the medical officer?—None.

3022. Ought there not to be?—Certainly.

3023. Supposing that the medical officer is consulted, and that he objects to the site, what would happen?—Taking it as a local question, the principal medical officer on the station would make his representation to the general officer, who would forward it to me for the information of the Commander-in-Chief, who would then refer it to the director-general, and send the whole representation with the opinion of the director-general to the War Department with his recommendation either one way or the other.

3024. The Secretary of State would decide, would he not, on the representations made to him in the correspondence on both sides?—Entirely.

3025. There is no person on the spot having authority to decide the question between the medical officer and the commanding officer?—None.

3026. With regard to barracks you say that they are never consulted?—Rarely; it has only been quite latterly when occasionally their opinion may have been asked verbally.

3027. Otherwise the engineering department are the entire arbiters of the whole questions of the site and construction of the barracks?—Quite so.

3028. The regimental hospitals are in the barracks, are they not?—Yes.

3029. Therefore, so far as they are concerned, the medical man has no voice?—No. They actually exist; the hospitals are there merely to be occupied.

3030. Its lot is cast in with the barracks?—Yes; in the new barracks there are instances in which the medical officers have reported on the insalubrity of the site. They did so at Winchester, for instance. There is a new hospital constructing there. I think that the situation is an extremely bad one. I went down to visit it; and I believe the medical officer also

Major-General
Sir R. Airey,
K.C.B.

29 May 1857.

reported against it. It is not only in a very low position, but it is on a piece of ground originally, I believe, the old ditch of the palace; it is all artificial ground and I believe that the medical officers objected to it as a site for the hospital, but their objections were overruled.

3031. Does the medical officer in the first instance make his remonstrance through the Horse Guards, or direct to the War Department?—The medical officer in the first instance makes his remonstrance to the general officer on the station, who sends it to the Horse Guards.

3032. So that the report and opinion of the medical officer when it goes to the Secretary-of-State is backed by the weight of the authority of the Horse Guards?—Yes.

3033. But it is very frequently without effect, is it not?—I cannot say exactly; I have not had experience enough to know.

3034. In the case of the Winchester hospital, was that so?—In that case the engineer had decided upon it and had constructed the building and I believe, though it did not go through me, another site had been recommended which was pointed out to me by the medical department as very desirable to be obtained.

3035. There the country had been committed to the expense and the insalubrity of the site had not been brought to the notice of the Horse Guards until the thing had been decided and the building commenced?—Precisely.

3036. If a site is decided upon is the medical officer consulted as to the construction?—Yes, the medical officer then is consulted as to the plan of construction.

3037. Would he have his opinion asked as to whether there was enough space allotted to each man, the ventilation, the sewerage, the supply of water, and so on?—I do not know. It does not come within my department to answer that question specifically with regard to the minute details; but with regard to space that has been fixed by the Ordnance Department or War Department, there are a certain number of cubic feet allowed per man.

3038. The general hospitals at Chatham are the principal general hospitals of the British army. Are you aware that the number of cubic feet allowed there is below the regulation?—Yes.

3039. So that the regulation after all is not strictly observed?—No, neither in hospitals nor in barracks.

3040. (*Mr. Martin.*) It is nowhere an imperative order as to the number of cubic feet?—It is not exactly so many cubic feet fixed, it may sometimes be in excess and sometimes in diminution.

3041. (*President.*) Are you aware of what space in the hospital is allowed?—Not less than 450 feet a man in the barracks, and in the hospital 600 to 700 feet.

3042. (*Sir H. K. Storke.*) That is not calculating the casualties in the barrack-room?—No; that is according to the appropriation.

3043. (*President.*) You speak now of the regulation for barracks in temperate climates?—Yes, of course.

3044. You do not know what space is allowed between the beds in the barracks?—There is no regulation about it, and it cannot exist, because if they divide the cubic contents of the room according to the number of cubic feet of air in the room they put the men in, so that if the room is very high, the men must be very much crowded.

3045. You are aware that the cubic contents alone give no rule as to health without a certain distance to keep them apart?—Certainly it must be so.

3046. If there are complaints of defects in the barracks of bad ventilation, insufficient sewerage, the latrines, and drains, and so on, does the quartermaster-general's department interfere, or is that considered a question solely for the consideration of the barrack-master's department?—Solely for the decision of the War Department. Everything now centres in the War

Department. It is brought to the notice of the quartermaster-general, and the Commander-in-Chief represents it to the Minister for War.

3047. Under the old system you would have represented it to the Master-General of the Ordnance, and it would then have gone through the board to the particular department which it concerned?—Yes.

3048. The War Department stands now in the position of the old Board of Ordnance to you?—Exactly.

3049. Are they not more immediately under the control of the Horse Guards than they were formerly?—I should not say control. The Horse Guards is in no character executive; it can do nothing of itself; it can only represent.

3050. In all points, take water supply or any other, all you could do would be to represent to the War Department that there was an insufficiency?—Nothing more.

3051. For the purpose of remedying those things there must be co-operation between you as representing the army who are suffering from the deficiency, and the engineer's department who is to remedy it. Is there any means of bringing your department and theirs in contact?—In case of any objection to a barrack in any way, either the want of ventilation or drainage, or any insalubrity, and it is represented to the quartermaster-general he can only forward that representation with the backing of the Commander-in-Chief to the Minister for War.

3052. Are an officer from the quartermaster-general's department, an officer from the medical department, and an officer from the engineer's department put into communication with one another for mutual co-operation upon the subject?—Yes, that is the course. It is frequently the case that boards are assembled consisting of a quartermaster-general's officer or regimental officer, an ordnance officer, and a medical officer.

3053. Do these work well?—Yes, but the report can be only forwarded for the consideration of the Minister for War.

3054. Are you satisfied with that arrangement; do you think that you get all that you want with regard to housing the troops?—Certainly not.

3055. How would you improve it?—It is the old story—money. Everything is stopped for the want of means.

3056. Supposing the money granted freely, is the machinery the best that you could have? Are you satisfied with the simplicity of the machinery, and the means of getting what you want?—As far as the machinery of the War Department goes I do not know. The only complaint that I have is the tardiness of the process, having to pass through so many hands. So far as the military departments go, it is immediate. We have a different system from the War Department—we work from above and they work from below. In the War Department everything comes up through a variety of channels until it gets up to the deciding point. We work from the deciding point at once. If an original paper comes before me, it comes to me first, and I act upon it immediately; it may be subject afterwards to any representation from any person who is my subordinate who may bring some regulation to my notice which I may have overlooked; but the action goes immediately from me in nine cases out of ten. The question probably goes that day to the War Department.

3057. In the War Department it is the reverse of that, is it not?—Yes; my paper goes then to some junior officer; from that to one above him, and so on, I believe, until it gets to the top.

3058. It is the same system, is it not, that is in practice in the Colonial Office?—I do not know.

3059. So far as you are acquainted with the barracks do you think that there is sufficient accommodation for the purposes of cooking in them?—I think that our military cooking is of the rudest description, and I think it is by no means sufficient in any way.

Major-General
Sir R. Airey,
K.C.B.

29 May 1857.

3060. How are the men's rations cooked?—A company is generally provided with two boilers, in one of which the soldiers boil their meat, and in the other they boil their potatoes; they have nothing else; a man goes on with it from the day that he enlists till he is discharged; he lives upon boiled meat for 21 years.

3061. Do you believe that is distasteful to the men?—I am persuaded, having commanded a regiment for 14 years, that the men are perfectly sickened with it.

3062. Has it come under your notice that they do not consume the rations?—Constantly. I have seen the meat after it has been boiled down to shreds thrown away; the men would not look at it.

3063. Do you think that that arises from the ration being larger than is necessary for the man's subsistence?—The meat ration is insufficient. I do not think that the soldier gets enough. I think that three-quarters of a pound of meat, including bone, is quite insufficient for the soldier.

3064. Even if you had a sufficient weight of meat do you think that it could be made more available than it is now and more agreeable to the soldier if he had better means of cooking?—Certainly, if the soldiers had the means of roasting, baking, and frying their meat. Independently of the diversity of diet, which I am very much in favour of, I am sure it would be much more tasteful to the soldier.

3065. The ration has been added to abroad, has it not?—Very much.

3066. There are colonial allowances in several parts of the world, are there not?—Yes, and in the field the soldier's ration is increased, and abroad he gets an increase of meat to his ration.

3067. But that is no greater increase than is made up for by the inferiority of the meat?—No.

3068. You may consider the meat the same?—Yes, abroad at some stations they get once or twice a week salt beef or salt pork, and they are very glad to get the salt pork.

3369. (*Mr. Martin.*) As a change?—Yes, they like a change, but that is done to get rid of the surplus quantity in the store, which they are afraid may deteriorate, not from any wish to improve their diet.

3070. Would you wish to add to their rations other articles to rectify the present sameness of it, such as rice, peas, flour, and so on?—Certainly, and if I could I should alter the whole system of cooking. I think that diversity of diet would be a very great point to attain, and I should be inclined to make it all one ration and to put grocery, meat, bread, and all, into the man's ration.

3071. (*Sir H. K. Storks.*) You are of opinion that he should be fed by the government, wherever he is?—Yes.

3072. (*President.*) And that the amount which the Government gives him should be sufficient to keep him in perfect health?—Certainly.

3073. (*Mr. Stafford.*) How would you improve the cooking?—I should give them the means of baking, the means of roasting, and the means of frying; they should have roasting grates, ovens, and frying pans: I should have in every barracks a sort of small batterie, so that the men might have stew-holes, and fry upon them the same as they do in the French army.

3074. Would that add very much to the expense?—No; very little.

3075. Would you not gain it in the fuel?—Yes; they have them in the French barracks, and the men are using their stew-pans all day long; they make stews, they stew vegetables, and improve their diet and diversify it very much.

3076. If you give them this increased ration you must have an increased stoppage, must you not?—Not actually out of the soldier's pocket, perhaps less than he now pays. At present it is done by messes: one man from the mess goes out with a non-commissioned officer with the men's mess money, which generally amounts to from about $2\frac{1}{2}d.$ to $3d.$ a day in excess of what he pays for his regular ration; they

go out and purchase their coffee, sugar, pepper, salt, potatoes, or anything else they can get.

3077. Is that compulsory upon them?—Yes; that is the commanding officer is allowed to expend a certain sum upon the dieting of his men, and he apporportions that as he chooses.

3078. It is not to exceed a certain sum?—No.

3079. $7d.$ or $8d.$?—It comes generally to $8\frac{1}{2}d.$ a day.

3080. Including washing?—Yes, one halfpenny is allowed for that. The Guards pay more as they have extra clothes.

3081. You conceive that an ample ration for three meals with variety would not cost the soldier more than he is now compelled to pay in the stoppage for his ration and the stoppage for his additional messing?—Certainly not.

3082. (*Mr. Alexander.*) Then he would always get it?—Yes.

3083. (*Sir H. K. Storks.*) How would you provide this ration. Would you do it through the commissariat?—Yes.

3084. Suppose the soldier to be sent on a detachment where there was no commissariat officer, how would it be managed then?—In the same way as he does now when there is no commissariat.

3085. You would then let him purchase his own things?—Yes.

3086. (*Mr. Martin.*) Would you have the young soldiers taught to cook, or so many men in a company?—The soldiers themselves like permanent cooks; they do not like being sacrificed to the instruction of a young hand. Some men have more natural turn for cooking than others. The soldiers like regular company's cooks, and the same men.

3087. To provide against casualties would it not be well to have so many men per company taught cooking?—Yes, certainly, but that would be a business of regimental detail and might be very easily done, because those young hands might go and stay in the regimental kitchens and learn the art of cooking.

3088. Does not it accord with your experience that nothing is done which is not ordered?—Yes, but it depends entirely upon the commanding officer of the regiment in organizing all those minor details.

3089. (*President.*) That would vary in each regiment, according to the capacity of the officer commanding it?—Yes; it is like a private house.

3090. (*Mr. Martin.*) Should it not be a systematic instruction?—Yes, I think there would be no harm in that, but the men themselves are very keen and alive to all these things, and if they get a bad cook they are the very first to complain to the captain. It is the custom in regiments that the messes are visited every day during meals by the officer, and he asks the question whether they have anything to complain of, and if there is anything really to complain of, they will invariably bring it to the notice of the captain.

3091. (*President.*) You were with the army, were you not, when they first landed in Bulgaria?—Yes.

3092. There the system of the ration, and $3\frac{1}{2}d.$ a day stoppage, the men having to purchase for themselves, entirely broke down?—Quite so.

3093. Then I think there was an additional stoppage made of above $3\frac{1}{2}d.$ a day, and the commissariat were to supply them with certain extras?—Yes.

3094. Did that continue long?—That continued all through.

3095. Except that when the commissariat could no longer supply them, the stoppage reverted to $3\frac{1}{2}d.$ —Yes.

3096. Does not that great variety of stoppages in different circumstances, one stoppage at home, another abroad, another on ship-board; the stoppage abroad oscillating according to whether the commissariat could supply them or not with necessities, create great confusion in the accounts?—Very great and very injurious, very complicated, very difficult, and very unsatisfactory to the soldier; he is

never satisfied with his accounts; and he never understands them.

3097. It would simplify things, would it not, if there were a uniform stoppage with a full ration of three meals?—Yes.

3098. (*Mr. Alexander.*) And on board ship?—Yes.

3099. (*President.*) Does it come to your knowledge that near the end of the war the War Department sent out persons to make a rough equitable adjustment with the soldier?—Yes, and a great deal of dissatisfaction existed, and it exists to the present day. I should say that the Crimean soldier is very much dissatisfied with the state of his accounts, and he suspects that he was not fairly dealt with. A soldier will submit to anything that he understands, and that there is good reason for; but what he does not understand he is very dissatisfied with.

3100. Supposing the government chose to adopt this full ration with an enlarged stoppage, do you apprehend that it would be difficult to introduce such a change into the army?—I should think it would be very easy.

3101. Would not the men suspect the intention of the government in making an increased stoppage?—I do not think so, if it was reasonably and properly done; if you charge them 6½d. instead of buying their tea, coffee, and sugar, and vegetables, besides half a pound of bread; as every soldier buys half a pound a day in addition to the bread that he gets.

3102. Why so?—Because the bread with the greatest economy only does for breakfast and dinner, and he has to buy half a pound of bread for his evening meal, and also tea, coffee, sugar, pepper, and salt.

3103. (*Mr. Alexander.*) You let the men purchase what is necessary to keep them in health?—Yes.

3104. (*President.*) Under the present system, in peace, a man is compelled to do so; his officer sees that he does procure those articles and consumes them?—Yes.

3105. Can he evade that by some understanding with the sergeants?—No; I should not say that he could; the soldiers themselves are very sharp, in fact the men go out and make the purchases themselves.

3106. Suppose a man preferred spending his 2d. in drink, could he do it?—No, he cannot do that. A non-commissioned officer and some men of the mess go out together and the money is expended. There are instances in which there is a misappropriation of the money, and the men are tried by a court-martial.

3107. Those are the only cases?—Yes, quite the exception.

3108. In point of fact by the present system you have an enlarged stoppage sufficient to keep the soldier in health?—Yes, with the exception of the government ration.

3109. The government ration, together with what he buys, is sufficient to keep him in health?—Yes.

3110. In war that breaks down, does it not?—Yes.

3111. Then you have the evil of complicated accounts as to the stoppages?—Yes.

3112. Would it be necessary if you made a change to give to all the soldiers who had enlisted beforehand the option of continuing under the old system?—I should say not. I do not think that it answers, if you make a wholesome, reasonable, and good regulation, to consult the individual soldier.

3113. Do not they hold that they were originally enlisted upon the contract that they were to have 1s. 1d. per day, and only to pay a certain rate for the rations, would they not look upon a change as an infraction of that contract?—I do not think so; I do not think that those are the sort of questions upon which the soldier is litigious.

3114. (*Mr. Martin.*) All the questions that have arisen in various countries between the soldier and the government that he serves have almost invariably had reference, have they not, to money matters?—Yes.

3115. As the ground of his discontent?—Yes.

3116. You do not apprehend that there would be any discontent on the score of change?—No.

3117. (*President.*) That would depend a good deal upon whether the soldier thought that he had the turn of the bargain or not?—I think that he would be very careful that he got his money's worth. If he thought that he could have supplied himself cheaper than at the rate supplied by the government then there would be dissatisfaction.

3118. Would he or not find himself in that position?—That depends entirely upon the legislation of the new principle. I think it ought to be done upon such equitable grounds that the men do not lose by it.

3119. At present by their own arrangements for buying, can they buy as cheap or cheaper than the Government could do, whose contracts are larger?—I do not think that there would be a great deal of difference; there is a good deal of competition in towns where troops are quartered.

3120. In point of fact you would take care to give the soldier everything he has now, and not to charge any fraction of a farthing more?—Yes; the soldier would be influenced entirely by his balance, and provided he got the same balance and good meals, he would be satisfied.

3121. From your experience in the East, do you believe that preserved meat can be more frequently used with advantage?—I do.

3122. It is cheaper than salt meat, is it not?—Yes.

3123. But it is a good deal healthier?—Yes.

3124. Cheaper and healthier?—I should suppose so.

3125. You saw a great deal of the evil which resulted from the salt ration, did you not?—Immense.

3126. Would it not have been possible for the government to send out meat very slightly salted, instead of being salted as the navy meat is?—Certainly.

3127. What was the length of time that salt meat was ever necessary to be kept in the campaign?—I think that if you sent it out periodically by instalments, a very short time, say six weeks, would have been quite sufficient.

3128. If it had been just sufficiently corned to last a couple of months, that would probably be all that was necessary?—Quite so. If Irish meat had been prepared in the way in which they prepare it in Ireland, and had been sent out to the troops, it would have been almost as good as the fresh meat to be obtained in the country. I think that those troops who were not close to the sea shore suffered as much in Bulgaria as they did in the Crimea from the diet.

3129. Why?—In the division that I was in, which was the furthest up the country, the men had nothing but their ration meat and biscuit, and some abominably baked bread, so bad that Mr. Alexander, who was principal medical officer, knows it was one of the great causes of dysentery and diarrhoea.

3130. (*Mr. Martin.*) Had you no preserved vegetables?—Nothing; and not only so, but the country was so thinly populated from the people having deserted from a certain degree of fear of the troops, and that they would be robbed, that there was the greatest difficulty in getting any thing.

3131. (*President.*) Were there no cattle in the country?—At first they were all driven into the hills.

3132. Could not the commissariat get at them?—The commissariat was so badly organised. The commissariat officers were officers of accounts. They were accountants, not field commissaries. They had no idea of stretching out into the country and bringing home produce.

3133. Is it not very difficult to have a practised commissariat in a country like England?—It is almost impossible; there is nothing analogous at all to it in England.

3134. (*Mr. Martin.*) Is it not essential that in time of peace, such a department should be made perfect in the event of war?—Certainly.

3135. And the time of peace is the time to do it, is it not?—Certainly; it is very difficult to put it in

Major-General
Sir R. Airey,
K.C.B.

29 May 1857.

Major-General
Sir R. Airey,
K.C.B.

29 May 1857.

action; everything here must be done more or less by the system of contract; you contract with the butcher for so much meat, &c.; and even at Aldershot, now, it is done entirely by contract.

3136. (*President.*) In a country like England, intersected by rivers and railroads, you cannot march troops across the country and send a commissariat officer into the farm yards to buy beasts, when some contractor will supply you at so much per pound?—No.

3137. (*Mr. Stafford.*) Would you have any system of teaching cooks?—I think that that is a thing the men must learn themselves, I think they are quite capable of doing it if they had the means, but I think that the means are wanted more than any other adjuncts.

3138. You think that if they had all those means and appliances of which you have spoken they would soon learn cooking enough to vary the dressing?—Certainly. I think that you occasionally meet men in all classes of life who have a sort of turn for cooking, and those men would instruct the others. You find in a regiment that you get hold of men to cook for you, and if you go on detachment you give yourself no uneasiness about it, but they cook you a capital dinner.

3139. (*Mr. Martin.*) You think that if the men had both the means and appliances, the cooking, so far as the ration goes, might be left to their own internal arrangements?—Certainly. I commanded a regiment for 14 years, and some part of that time I was a married man, and I never had anything but a soldier cook, and he was a very good one; it was not always the same. The means of instruction are in the regiments themselves.

3140. (*Mr. Alexander.*) Do you think that the repairs might be done more easily and more rapidly by hiring labour than by employing engineers for the barracks and hospitals?—On the spot?

3141. Yes.—Certainly.

3142. (*President.*) What is the reason that everything the engineer seems to do so is so dear?—I really do not know. There is a technicality that attends all engineers. I do not understand it.

3143. Is what they do more lasting?—Perhaps it is of a more permanent nature; it is taken more *en grand*, and there is a want of simplicity about it. I recollect an instance. I was sent with a strong force into the county of Leitrim. We were encamped, and it was likely we should remain there some time. I wrote to Sir Edward Blakeney, stating that the men had no means of cooking, and the weather was extremely wet. We were near the famous Ballynamuck, on a very swampy bit of ground, and I wanted very much to get some means of cooking independently of the common camp kitchens, which were deluged with rain; and I proposed to Sir Edward Blakeney that we should be allowed to construct a cooking apparatus with two boilers in the usual barrack way; an engineer officer came down; there was an estimate and a specification, and then it had to be submitted to contract, and in about two or three months I should have had it done at a cost of 90*l.* but the end of it was that I said it was of no use doing it, we should not be that length of time there, and it was given over. I got it done by a man from the town of Mohill, and the cost was 17*l.*, or something less than 18*l.*

3144. (*Mr. Alexander.*) Would it not be better to have the barracks whitewashed by the regimental officials than trusting to the barrack department?—It would be more rapidly done.

3145. (*Mr. Martin.*) Is it the engineer corps that is specially employed in the construction and repair of public works?—Yes.

3146. There is no other department?—No; that was an arrangement of the Duke of Wellington's.

3147. (*Mr. Alexander.*) Would it not be an advantage if you had drying rooms for the men?—Yes, very great; we have them here in the barracks in London.

3148. But in all the barracks it would be an advantage, would it not?—A very great advantage.

3149. (*Mr. Martin.*) Does the practice exist in the foreign possessions of consulting medical officers on the sites of proposed hospitals?—No, I do not think so.

3150. (*President.*) Have you turned your attention also to the things which have a moral effect in barracks, such as the recreations?—Yes.

3151. Have the men the means of playing at games,—racket courts and quoits?—None at all, comparatively, and I think that they ought to be extended in a very great degree; I think that the men ought to have ball courts, racket courts are out of the question for the men, as they are expensive; they ought to have foot ball, cricket, quoits, and all sorts of games of that description; and I think there should be an improvement in the barrack system, giving them some rooms that they could go into and get a cup of coffee or tea. The question of smoking in those rooms has been experimented on, and in some instances it has succeeded and in some not.

3152. Should you leave that to themselves?—Yes; I think it is better not to over legislate upon those points.

3153. But they all smoke, do they not?—Very generally.

3154. It is convenient to them to be able to smoke in these rooms, is it not?—Yes; I think almost all soldiers smoke; it is a common thing for a man to give another man half a dozen pulls at his pipe, passing on. What we want more than anything is the lighting of the barracks, they have not the means of lighting. If you go in late in the long winter evenings you will see one man trying to read with a miserable tallow candle, and four or five other men huddled round him to listen.

3155. (*Mr. Stafford.*) Who finds that tallow candle?—The barrack department.

3156. (*President.*) They have a regular allowance, have they not, for fuel and light?—Yes; all the allowances of fuel and light are by rooms divided into twelve men.

3157. Have you any barracks lighted by gas?—Some are; all the new barracks are: that system appears intended to be general.

3158. (*Sir H. K. Storks.*) The lavatories are very bad in the barracks, are they not?—Very bad indeed.

3159. (*President.*) They have urine tubs in the barrack room, and they are very offensive, are they not?—Very bad.

3160. (*Sir H. K. Storks.*) What means have the men of making water at night?—They have urine tubs.

3161. Do you recollect an order being issued calling the attention of the commanding officers to men washing themselves in the urine tubs?—It was the general practice throughout the army; they had no other means.

3162. Since when?—Since I have been in the army.

3163. (*President.*) What are those urine tubs made of?—Of wood.

3164. Do not they necessarily stink?—Most offensively.

3165. Why do they not give them chamber-pots?—It is not one of the barrack utensils, it is not barrack furniture. There will be no difficulty in having the same pewter chamber-pots as they have in the hospitals. I think that every barrack ought to be provided with proper utensils.

3166. (*Mr. Alexander.*) The privies are nothing more than cesspools?—They are abominable, and extremely offensive. The system was to empty them by contract, but latterly it is improved very much indeed, because it is all bought for manure.

3167. (*President.*) On field service if the site of a camp is selected, I do not mean a position taken up during the very short space necessary for certain operations in the field, but a permanent camp, would the medical officer be consulted as to the site?—I do not think that as a rule he would. Military reasons would govern, and if it was intended to take up such positions as we did in Bulgaria, the quartermaster-

Major-General
Sir R. Airey,
K.C.B.

29 May 1857.

general would select the site, and he would be governed in that selection by the proximity of wood and water, and the distance that the men had to go for it, and the importance of the position generally.

3168. In that particular case in Bulgaria, would not a medical opinion in one or two instances have been very advantageous, the medical men being more likely to know what are the indications of healthiness than a man whose attention has not been turned to those peculiar subjects?—I should say so, unquestionably. I think, individually, that if I commanded a body of troops I should, on those points, go hand in hand with my medical officer, and even in the removal of the camp, provided there were no military reasons which should overrule it.

3169. Of course any strategic reason would override that?—Yes.

3170. Feeling that, do you not think that by regulation the medical officer ought to be consulted and give his opinion?—Yes.

3171. Would it be a check to show whether his recommendation had been attended to if he gave his opinion in writing?—Certainly. I think Mr. Alexander must recollect an instance when I commanded the Light Division, on the first indication of cholera at Devno; it was on a Sunday. It was represented to me that a good many had fallen from it, and there was a question about moving the camp directly. I spoke to Mr. Alexander about it, who agreed with me in this—he said we must take great care what we do. Some commanding officers were anxious immediately to move their regiments a quarter of a mile off. Mr. Alexander's opinion with my own was, that it would be very dangerous to do that, because by the panic we might create that very consequence that we were trying to avoid, and we decided to hold hard a little. I rode off in other directions to look for another site, and when I came back I found either Mr. Alexander at my tent or a note to say that he recommended the removal of the camp, and we marched the next morning.

3172. (*President.*) Did you get more space?—We went to Monastir, which is called the Montpellier of Bulgaria, but I think they died there much faster. After that we moved the regiments in different directions to a long distance, still the disease followed them. And a curious fact is, that the 19th regiment remained upon the dirty soiled ground of all the rest, and the only place that could be used as latrines was a deep rocky ravine, which had been so much used by the whole of the divisions, that the exhalations thrown up were so bad, that one evening, when I was riding late through it, I determined to remove that regiment though it had been perfectly healthy. I moved it on to a fine beautiful piece of ground, and there they took the cholera immediately.

3173. Could you ascertain what were the other causes that produced that effect?—No.

3174. (*Mr. Stafford.*) Was there any difference in their system of cleansing themselves?—None whatever.

3175. (*President.*) Were the tents pitched nearer or further apart?—No. I think that the ground of the 19th was rather more crowded.

3176. You had not the power, I suppose, of reducing the number of men per tent?—No. There we could not; we were only allowed so many tents for a battalion, but that is a question that is very open. Whenever you have the means, a general officer can do anything that he likes. Afterwards we were much less crowded.

3177. Is there any code of regulations existing as to the management of camps?—Yes; there have been various codes for the establishment of camps, and regulations as to the distance between the tents, and everything connected with them. The last is this book, which was brought out in 1853, containing all the regulations for field service.

3178. That gives rules for draining, cleaning, and the regulations of the abattoirs?—Yes. Then in the general regulations of the army we have the same (*handing in the same*).

3179. Take the first page of this, which says, "That the means of passing freely through the encampment with a large front be maintained; that the tents be disposed with a view to the greatest amount of order, cleanliness, ventilation, and salubrity." Of course that is an object; do not you lay down what are the means by which that can be attained; what distance they should be apart?—There are certain rules as to the distance from pole to pole of each hut; then there are also rules as to the allinement of the tents, whether in single or double lines; that depends a good deal upon the opinion of the general officer. You meet one sometimes who prefers symmetry to anything else, which is very unfortunate.

3180. And there are commanding officers who like to have their men compact?—Yes. I am more in favour of single lines. I think that the tents ought to be all perfectly single, and that every tent should have its own street both before and behind it. Others like them put back to back. Then very frequently the ground may be confined because you take up a particular ground for a division or a brigade, then you are obliged to put those three or six regiments into that piece of ground, and you divide it in the best manner you can.

3181. Do the regulations point out the means of draining the tents and digging a fence round them?—There is an order that every tent is to be trenched, and that there be general drains to carry away the water. The ventilation is very imperfect, and there have been a great number of inventions and experiments examined by committee after committee, but there has been none found practically to answer for the field. The tents have defective ventilation, they have four small holes at the top covered over but it is very imperfect.

3182. What is the best kind of tent?—I think that for service the best kind of tent is the bell tent, and the hospital marquee.

3183. Should it be made with canvas or cotton?—Of canvas.

3184. Is that better than cotton?—We have had many experiments, and sent to all parts of the world for cotton and linen tents. All the linen tents used by foreign nations are double and are much heavier, and when they are double they are more impervious to the air than a canvas tent.

3185. Do they keep out the water better?—No.

3186. What is the advantage of them?—They are much lighter when single.

3187. What are the Turkish tents?—They are calico, and much hotter. If you could have a double tent, so as to allow the air to pass through the intervening space, it would be a very great advantage.

3188. They have those for hospital marquees, have they not?—In some cases they have.

3189. (*Mr. Martin.*) They are only in general use in hot climates?—Yes; we have no actual regulation double tents; but we have a lining to the marquee.

3190. (*President.*) You do not like the little tente d'abri?—Very much; but that is merely for bivouacking and marching. I think that the French system is extremely good; they carry their large tents entirely in their equipage de train, the men march with their tentes d'abri on their backs, they pitch their tents, and remain there as long as they halt; but if they are going to be stationary the fourgons come up and they unload all their large tents and pitch them, and their tentes d'abri are taken away.

3191. Before Sebastopol the French suffered, did they not, from being reduced to their tentes d'abri long after the weather required better shelter?—They had no large tents during the winter of 1854. General Canrobert came to me complaining of the condition in which his men were; he said that they were dying in the mud.

3192. You would recommend those small tents in addition to our tents, not as substitutes?—No; but you cannot have any celerity of movement with the immense weight that the English soldier carries.

*Sir R. Airey,
K.C.B.*

29 May 1857.

3193. What are the arrangements with regard to cooking in the camps?—The only arrangements are the construction of camp kitchens, and those are merely made by collecting stones, if you can get them.

3194. Do the men make them well?—Very well.

3195. (*Sir H. K. Storks.*) They cook by squads instead of by companies, do they not?—They cook generally by tents. They cut a trench in the ground, and if they can get a few iron hoops from barrels they put bars across; but, however, the men become extremely ingenious, as Mr. Alexander knows. They built bakehouses almost directly by cutting a hole in the side of the cliff.

3196. (*Mr. Martin.*) Do you trust to the casual circumstance of there being bakers in the regiment, or are there men trained to baking in time of peace?—Never.

3197. Do you trust to chance?—Yes; and the consequence at first is that the baking is very bad and very defective. The system is this, if it is intended to bake in the regiment, the officers of the regiment are ordered to send in a nominal list of the men who bake. A soldier says, "I will turn my hand to bake," perhaps he has never baked in his life; he commences baking, gets drunk, and the bread comes out a heavy doughy mass, and it is a most unwholesome mass.

3198. You think it desirable, do you not, that men should be taught to bake?—Yes, but I think that we ought to do what the French do, they enlist the man that they want; they enlist in their corps bakers and artificers; we have nothing of that sort: there was very good baking in the Crimea latterly, all the divisions had bakehouses worked by soldiers.

3199. (*President.*) Would you attach to the companies men for the purpose of baking?—Yes, soldiers.

3200. (*Sir H. K. Storks.*) Who should be struck off all other duties?—Yes, but soldiers.

3201. (*President.*) And for cooking the same?—Yes. I think the cooking would be better.

3202. You would be entirely at a loss if you lost your cook, the other men not being in the habit of cooking?—As it is in all the regiments you have your cooks and assistant-cooks; a man taken as an assistant-cook very soon picks it up, and cooks you a very good dinner.

3203. (*Mr. Martin.*) Your department is specially employed in the military topography of the army?—Yes.

3204. Do you think that the Department of Medical Topography should be officially associated for field purposes with that of military topography with reference to the influence of locality, and external circumstances affecting the health generally, with regard to the sanitary condition of the army; how would you propose to associate medical with military topography?—I think that every officer of the Quartermaster-General's Department who is desired to take up ground, ought to be accompanied by a medical officer.

3205. As a matter of regulation?—Yes, laid down as such, and that if there is any want of concurrence he should put his opinion in writing.

3206. Where military considerations do not overrule the medical, his recommendations should receive due attention?—Certainly.

3207. (*Sir James Clark.*) Do you mean that a medical officer, specially appointed to superintend the sanitary condition of the camp should accompany the army?—No. I think that the principal medical officer of the division should be in connexion with the quartermaster-general, and that they should work together.

3208. Would it be a good arrangement if an officer was appointed entirely to superintend the whole camp and report to the quartermaster-general?—I have always thought that independently of the chief medical officer in the army there ought to be a field deputy, who should be the officer who should have that charge that you speak of together with the

other medical duties; that he should inspect all the hospitals and report to the principal medical officer.

3209. (*President.*) He would act as the head of a sort of sanitary police?—Yes, he would be the second medical officer, and he should be responsible on all those points.

3210. Would he not be very much what is now wanted in the towns in England, namely, an inspector of nuisances?—Yes, but his functions would go far beyond that again; he would have the inspection of all the hospitals, and be a practical working man in the field.

3211. Though a medical man?—Yes; a military medical man of high rank.

3212. (*Sir James Clark.*) And he should be immediately under the inspector-general?—Yes, under the senior medical officer in the camp.

3213. If you had had such an officer in the Crimea would he have been very useful?—Extremely useful; because the senior medical officer's whole time was taken up in administration, so that he could not give any personal attention to the subject.

3214. (*President.*) You state that there are regulations (which you have put in) as to the mode of encamping. Are they as full as they ought to be after the last war?—Certainly, I think so, to any man who is really anxious to interpret them properly.

3215. Are there any sanitary regulations extant for the proceedings to be taken on the occupation of towns?—No; there are no particular regulations except those which would naturally strike everybody; but I have never seen a native town, from the day that it was occupied, that did not immediately assume an aspect of cleanliness and order that did not belong to it before the troops were there.

3216. In a town of 10,000 inhabitants, if you suddenly added 10,000 men, unless some immediate precautions were taken, the doubling of the population must necessarily produce disease?—Yes. But if in a village containing 500 people, you put 500 men under military control and discipline, they commence a system of cleanliness and order which changes the aspect of the town immediately.

3217. You would not go so far as to look to the sewerage of the place; it would merely be external cleanliness?—Yes.

3218. Would not regulations be useful on that point?—Yes; I think it would be very advisable, but I think it would be naturally done. If you occupy a town with 10,000 men, there is no such thing as putting 10,000 men in a town; you take perhaps a few houses, public buildings, and you can put the troops in them, and they assume the character of barracks directly.

3219. In the same way are there regulations for bivouacking?—No; it is arbitrary. That is for a night or two nights.

3220. After the experience of the war and the experience of Aldershot as to huts, does anything occur to you with regard to any improvement in their construction?—Yes; I think that our present huts are very imperfect, I think that they want ventilation; I think that the whole construction has been bad, the material has been very flimsy, and it has been a system of nailing. In the huts that are sent out to North America, into the bush, and to Australia there are no nails at all; there are grooves in the uprights and slip the boards into them, and four or five men can put up a hut.

3221. That is, supposing that you have them all ready made by carpenters, but if the men had to hut themselves, merely having the timber given to them, what system would you adopt?—Then the best hutting is the system adopted by the Turks, and taken by the Sardinians a great deal from them; the best hutting that I saw was in Omer Pasha's army.

3222. In what respect were they the best?—They were warmer and more impervious to the rain. They had a manner of mixing the clay and the ashes of wood and the dung of horses together, which they

Major-General
Sir R. Airey.
K.C.B.

29 May 1857.

put upon hurdle walls. I think they were the best huts of all, wattle and dab. Suppose we take this table for the ground, they excavated about two feet, so as to leave a wall all round, then they put the wattle and dab for walls, and roofed it with any timber they could get, which made it a very warm hut.

3223. (*Sir James Clark.*) Does not it get wet when it is under ground?—No, it is perfectly dry; there is a drain all outside.

3224. (*Mr. Martin.*) Should the soldier be taught, as a matter of duty, to hut himself?—Certainly, he should be taught everything, and they soon pick up a knowledge. It is the same system upon which they make gabions or hurdles. You teach a man, he puts a quantity of stakes on the ground in a line, and he weaves the wattle into them.

3225. (*Sir James Clark.*) Were the Turkish huts ventilated?—Not so much as we should think right; there was a doorway, and at the other end there was a square window.

3226. You stated that the huts at Aldershot are badly ventilated?—Yes.

3227. Was any medical man consulted in the construction of those huts?—I do not know. Even in the Crimea the medical officers frequently remarked the imperfect ventilation.

3228. Is it desirable, in forming the huts, that a medical opinion should be taken?—Yes, on every subject that is necessary.

3229. (*Dr. Andrew Smith.*) Do you think that in the army generally supervision by the senior officers throughout the whole of the grades is necessary?—Certainly. We could never get on without it.

3230. Do you think, from your experience of fourteen years in the command of a regiment, that you could safely trust to the captains of companies to take care that the arms, accoutrements, kits, &c., were always in the condition which they ought to be?—Most certainly not without supervision.

3231. How often would you take steps to ascertain that as a colonel of a regiment?—It is the practice in all regiments, with regard to the arms, that the commanding officer inspects his regiment every day; he more or less inspects the arms every day, but they are inspected under his eye when he is on parade, he sees the officer examining the arms and inspecting them.

3232. He would not trust, in the case of barracks, entirely to the captain of companies saying that all the barrack rooms were kept in proper case, would he not go round himself?—Invariably; it is one of those questions that the commanding officer is perhaps constantly finding fault with the captains of companies for want of attention to. If it were left entirely to them the whole thing would break down.

3233. You would not think that a regiment might be left to itself, without the occasional inspection of the general officer?—No.

3234. (*President.*) How frequently need that take place?—It must depend entirely upon the regiment.

3235. You do not think that it should be weekly?—No, not for the general officer. It is a very wide question. The general officer has to look into all the instructions of officers, and a great many other details. I think that the present half-yearly inspection is quite often enough; but with regard to the commanding officer of a regiment, it is the practice for him to visit his barracks all over, at least once a week, and no regiment is really in very good order unless it is so visited by the commanding officer himself. It makes the greatest difference whether the commanding officer really does it, or does it by deputy.

3236. (*Dr. Andrew Smith.*) Supposing a brigade is at Shorncliff, and a principal medical officer is there, he stands there, does he not, with regard to the medical officers nearly in the same position as the commanding officer stands to a regiment. How often, do you think, for the good of the service is it neces-

sary that he should go round the hospitals?—I should think that once a week was as little as he ought to do that.

3237. (*Mr. Alexander.*) Do you think that he ought to examine into the extras and the diets, and to see what the regimental surgeon had done, and find fault with it?—I think that he ought to have the power of examining into all the details.

3238. Do you not think that the regimental surgeon is a sufficiently good judge as to prescribing for his patient without this sort of superintending during the week?—That is a question which is difficult for me to answer. It must depend upon the ability and character of the medical officer of the regiment, but it is like the case of the commanding officer of a regiment. Some commanding officers of regiments require more supervision than others.

3239. (*President.*) Is there any strict analogy between the duties of a regimental combatant officer and a medical officer?—No.

3240. The object of the commanding officer is to see that the company's officers do their duty according to certain rules laid down; do not you imagine that the regimental surgeon treating his patients would be a better judge of what the patients required than the inspecting officer who is not treating them?—Yes, certainly; if a man is fit to be appointed surgeon of a regiment, I think that the treatment of the individual men must be left to him.

3241. You would have frequent inspection as to seeing that the hospital was in order, but not for the purpose of interfering with the discretion of the medical officer, unless he found that he was inefficient?—I should suppose not.

3242. (*Dr. Andrew Smith.*) If you had a surgeon in your regiment you did not consider a very efficient man, and the regiment had no confidence in him, and the inspecting medical officer found it necessary frequently to visit that regiment, would he not be doing his duty, and doing the duty that the service required of him, if he examined into the treatment adopted by the surgeon?—Yes; but I should suppose that a man of that sort ought to be got rid of. In the medical report that is made the peculiar disease of the man is always mentioned, and more or less his treatment.

3243. (*Mr. Martin.*) In your experience have you not found that the most important medical officer in the army is a trustworthy regimental surgeon?—I think that in the regiment he is, but the administration does not belong to him; still I think our regimental system is extremely good.

3244. In civil life the physician and the surgeon of a hospital is the great authority for science and practice?—Yes.

3245. Do you think that a regimental surgeon is the only man in the army who would appear to stand in a corresponding position?—Yes.

3246. (*President.*) Do you think that the army is well clothed and equipped?—No. I do not think that our clothing is at all good.

3247. Are there any parts of the soldiers' clothing which you should like to see changed?—I think that all our cloth is bad, and I think that the boots are bad.

3248. The cloth is very much improved, is it not?—The last issues were improved, but it is a hard and unpleasant cloth for a man to wear; it chafes him, and it does not wear well either; and it is full of size and stiffening.

3249. (*Mr. Stafford.*) Have you had any opportunities of comparing it with the French cloth?—Yes, frequently.

3250. Which is the best?—The French. While I was in Paris I heard from the French Minutemen for War that it was all English cloth.

3251. (*Sir H. K. Storks.*) Do you think that the chako is a good head-dress for the soldier, considering the climates to which he goes in the course of

Major-General
Sir R. Airey,
K.C.B.

29 May 1857.

his service?—It is a very difficult question. I think that perhaps a felt hat is as good as any. When you limit the price to a certain sum, it is made of hard and durable material, but it presses very much upon a man's forehead, although very much less than it used.

3252. (*President.*) It is a much better shape, is it not?—Yes, it is. I do not think that it is particularly good, because it defends him very little from the sun, and the rain comes down the sides of it.

3253. (*Sir H. K. Storks.*) Do you consider the forage cap to be a useful head dress?—We must have something of that sort soft and light. I think it is very difficult to adopt any one uniform cap for the West Indies and North America.

3254. You would change the cap according to the climate to which the soldier went?—Yes; we do that more or less. In North America, the men have a fur cap.

3255. Take the tropical climates. There has been no change there as to cap?—No.

3256. (*Mr. Martin.*) The men make it for themselves; they put a piece of cloth round it, do they not?—They did, but it never was adopted till the army went to the Crimea, putting a white covering.

3257. (*Sir H. K. Storks.*) Do you think that a peak is desirable on the forage cap?—Yes.

3258. (*Mr. Alexander.*) Do you prefer the French to ours?—The French peak.

3259. (*President.*) Do you recollect the flat forage cap that the guards had, a few years ago?—Yes.

3260. Was that a better cap?—No.

3261. Why not?—The men did not like it—it departed from its original character, and it was soon abandoned, the men were ashamed of their appearance; it was not found to answer.

3262. (*Sir H. K. Storks.*) What do you think of the stock?—I think that a handkerchief is a better thing.

3263. (*President.*) A handkerchief looks bad, does it not?—It looks untidy, but it is more comfortable to the soldier.

3264. (*Mr. Alexander.*) Could not you adapt the collar of the coatee to fit the neck, so as to do without the handkerchief?—That has been tried; they had a piece of cloth, but that gets so greasy that it does not do.

3265. (*President.*) Before the change they had the Prussian collar, had they not?—Yes; the stock was not seen.

3266. (*Mr. Alexander.*) Could not you have a piece of leather?—I do not think that the men care very much; on the line of march if a man was obliged to wear his stock he would complain, but they used to be taken off and carried on the muzzle of the firelocks.

3267. (*President.*) Is it a good thing that it should be so made that when the man comes to move he must take it off?—The men like to look well, and it looks better.

3268. Do you think that it does look well?—Yes.

3269. (*Sir H. K. Storks.*) Do not you think that carelessness in dress has a very bad effect in the army?—Yes, very bad.

3270. Do you think that it demoralizes the soldier?—Yes; it does a very great deal of harm. There is nothing that the men care more about than appearance.

3271. Do not you think that flannel shirts would be a better thing than linen?—I am very much in favour of flannel.

3272. In all climates?—I had it in my regiment, and the men were very dissatisfied when they were obliged to change; and a great many of my men kept them,—they begged to be allowed to keep them.

3273. (*Mr. Alexander.*) Is not the tunic preferable to the old coatee?—Yes.

3274. (*Mr. Stafford.*) Have you any alteration or modification to make of the evidence which you gave before the select committee on the army medical department in June 1856?—I must look it over. The only thing that I am anxious to press upon the notice of the Commissioners is the insufficiency of the meat rations, the want of diversity of diet, and the want of recreation, games, &c.

The witness withdrew.

ROBERT RAWLINSON, Esq., examined.

R. Rawlinson,
Esq.

29 May 1857.

3275. (*President.*) You are a civil engineer, are you not?—I am.

3276. Were you one of the sanitary commissioners sent out to the army in the East?—Yes.

3277. You had had some experience in sanitary works and regulations before that?—I was one of the inspectors under the General Board of Health, and it had been my duty to inspect many towns in all parts of England.

3278. The report of the proceedings of the Commissioners of December 1856, may be taken, may it not, to contain all the opinions which you had to give upon the measures necessary to secure the sanitary state of the army in the field?—I should scarcely say all, because naturally there are things remaining in one's mind, that are not altogether embodied in any report, and although that report is a very full, and I believe a fair statement of our experience in the East, many things might be added to it.

3279. Will you suggest what you refer to?—I perhaps may state to the Commissioners that our report deals with facts in the simplest possible manner as they came before us. It states what we found, what we suggested, and what we did; but I can easily imagine that other circumstances and other facts might arise of a very different order and nature, and you could not probably find any recommendation in the Crimean report which would apply to this new order of things. For instance, with regard to an army occupying a new country, I can quite conceive how many of the sanitary evils that were rectified might be again repeated. I think for instance in occupying

a town as to which we have given certain suggestions, that soldiers might be put into a town in which they would be overcrowded if the inhabitants remained there; they might be also put into buildings to be turned into barracks, and they would be overcrowded. You will find one statement in the report that the cubical space per man must always be in connection with the distance apart of the beds—now you must not take the one for the other; you might have all the cubical space required but not the distance apart. Then again as to the water supply, I think that is a question which deserves most serious consideration. I cannot pretend to say what are the whole of the army regulations, I am not master of them, I can only speak of what came under my own eye and what I think is necessary. I found in the Crimea that the water supply was neglected. When I say neglected, I mean that the springs were left as open springs. Many of the spring-heads—probably nine-tenths of them—were in the possession of the French, the Sardinians, or the Turks, our troops receiving the fouled or refuse water; and many of the wells had been ruined on the first occupation. These were not repaired. The troops quartered near those wells drew water indiscriminately from them. They filled a bucket with water and drew it to the top, and water was scattered about from morning to night; they wasted as much as they used and they drew the water muddy. I think that the water supply should be put immediately under military surveillance, that sentries should be put over every source of supply, and if it is impure, means should be taken to make it better; that if springs exist, reservoirs should

R. Rawlinson,
Esq.

29 May 1857.

be made to equalize the yield of 24 hours, and that the water should not be drawn by dipping, but be drawn from taps.

3280. You came to this conclusion from having observed the bad effects of the neglect of those precautions?—Yes; from observing the great waste; besides the men were continually using muddy water; it was dirtied from large copious springs, by being drawn at the spring-head, and the earth washed back into the water. The mode of drawing was all by dipping, instead of having the water drawn from taps.

3281. (*Mr. Stafford.*) Did you see many arrangements for keeping the water in a series of barrels, one placed below another?—I think there were some temporary arrangements made at the Castle hospital, but they were very rude and in the most imperfect form.

3282. (*President.*) If you let water come into a succession of troughs that is a bad plan for the horses; they will not drink the water that has been blown into by another horse?—At the cavalry camp, with several thousand horses, the method of supplying them was to place trough below trough, one trough overflowing into the next below. Horses object to blown or tainted water from other horses, and frequently would not go below the third trough; and there being entire horses among them, there was plunging and kicking from morning to night. A very easy engineering appliance would have filled every trough independently, and no more water would have been required. Either a pipe or a wooden trough might have been taken down behind, with the means of regulating it, so that each trough should have an independent supply, simply by regulating the feed into each trough, so that each should get its own independent supply, and free from those above it. The evil was, in allowing the overflow from one trough to fall into the other, so that the tainted water above ran through the line of troughs. Each trough should have its own independent water supply.

3283. That is as regards the supply for the horses, but with regard to the supply for the camp would you require any materials to be carried with the army, or could you husband the water by means available on the spot?—The only materials that would be required would be a few dozen common screw taps,—the common house tap—say inch taps, and a few yards of pipe, but that is not necessary, because an engineer officer might make upon the ground within a couple of hours a square box, into which he could screw his taps. Suppose a spring yielding 10,000 gallons a day, they could make a tank 30 feet by 20 feet, and a yard deep, and then place a trough at the lower end communicating with the water and having a dozen or more taps outside, and they might draw from the taps and not dip the water. It is the dipping and splashing back that soils the water.

3284. (*Mr. Alexander.*) What number of taps would you have, as a great deal of time would be required to draw water for 5,000 men from a few taps?—You might put in three dozen. You could multiply your taps and give more men access to the water than in the dipping process.

3285. (*President.*) No tap will fill a pail as quickly as dipping?—It will fill it in 5 seconds.

3286. Under your plan you would make a number of reservoirs into which buckets could not be dipped?—Yes, and if you must dip, make your arrangements so that the water shall not flow back to taint the remainder, and so be muddy water from morning until night; multiply the number of places for drawing, and protect all watering places, so that the water shall not flow back out of the bucket with the soil into the water that will have to be dipped the next time; I would place a sentinel or sentinels upon every water supply, and not allow the men indiscriminately to take it; I would place a guard and man or men to draw and serve the water out.

3287. Can you purify water at its source without difficulty or not?—There is no serious difficulty; a sapper properly taught could do it if he had four pieces of board, and if he were to make a square

trough and nail it up (*describing the same*) and simply fix it at an angle, placing a grating over the bottom and filling it for two feet in depth with sand, gravel, and charcoal.

3288. Where is he to get the grating?—He might make it out of timber, anything to keep the material from coming out, run dirty water through some sand and charcoal and it will come out comparatively pure and free from injurious vegetable matter.

3289. Where is he to get the charcoal?—You should have charcoal burners.

3290. You would have men among the sappers accustomed to charcoal burning?—Yes; the charcoal could be easily burned. It requires a little experience. You must cut the timber down and sod it over; you cannot make it by an open fire.

3291. Where timber is available there is nothing easier than to make charcoal?—I should say so; but you must have a charcoal burner.

3292. That is one of the things which you would exact from the sapper that he should be acquainted with the mode of burning charcoal?—I think it is one of the things that you ought to have the means of doing in the army, because charcoal can be used for other things. It is extremely useful as a deodorizer in any temporary hospital.

3293. Is there anything else that occurs to you as a mechanical improvement that would be useful in connection with the army?—I must speak a little under correction, because I really do not know what the military engineers have at their command. I only know what they had not at their command; I can very easily conceive how you could turn to singular advantage a portable steam-engine or portable steam-engines like a farming steam-engine, that should have pumps, circular saws, boring, planing, and mechanical appliances so well known now for converting wood to useful purposes. You might use this machinery for converting timber into gun platforms, and to many other purposes. I was told in the Crimea that our engineers had not timber for platforms in the front, and that they had to procure railway sleepers.

3294. Within what space could you pack instruments of this description; would not they be very unwieldy?—A portable steam engine would travel where a field-piece would go, and with the same number of horses.

3295. (*Sir H. K. Storks.*) Would six horses draw it?—I have no doubt about it.

3296. Would it not be liable to be put out of order by a bad road?—Not more than a gun; but then your engineer sapper would be there, and he would put it in repair.

3297. (*Mr. Stafford.*) You must have an engineer to keep it in repair?—He must be an educated man.

3298. (*Sir H. K. Storks.*) Supposing this machine got out of order, how would they repair it?—There would be no more difficulty than there would be in shoeing a regiment of horses; the engineer smith would use the same means. A portable steam engine could be made so that there should be no piece of it (except the boiler) more than 1 cwt., and you could have duplicate portions; I only throw out the hint as a suggestion; if a great deal cannot be done, a little may.

3299. Do you think from your experience of this portable steam engine, which certainly does go over ploughed fields, that there would be no more difficulty in carrying it about with you than in carrying a gun?—I think not.

3300. It would be very useful as long as it was in practical working order?—Yes; ultimately government sent out a steamer into Balaklava harbour, fitted up as a workshop, and I believe it was found very useful. The engines and machinery employed by the railway workmen were also most useful, not only for the purposes of the railway, but for the army generally. There are horse-machines, used in America, which also would be useful.

3301. Have you any suggestions to make with regard to the huts?—I saw the huts and suffered some inconveniences from them in the Crimea, and the tents also. With regard to the huts, they ought

R. Rawlinson,
Esq.

29 May 1857.

to be made in portions that would fit together by screws, and not by nails; they ought to be made in such pieces that one or two men at most could carry any single portion with ease.

3302. That would be in the case of huts being again made in England, and sent out for the use of the army abroad?—Yes; but I think you should always have some huts for hospital purposes; bell tents do not answer well for hospital purposes.

3303. You cannot carry about with an army moving in the field the materials for building huts?—This may be true; but as the case may arise again when huts may be required, the best plan for the most portable and most easily erected hut should be adopted. Those sent to the Crimea were on the very worst plan. The parts should be made to fit together without nailing, as when a hut is once up and nailed, it is simply firewood. I defy the sappers to take it down and move it so as to preserve it for use.

3304. (*Mr. Stafford.*) And the timber split with the nails, did it not?—Yes; it warped the same as a piece of parchment before the fire.

3305. (*President.*) With regard to the drainage of huts, have you anything to suggest?—When we first went out many of the huts were neither drained nor ventilated, but they were set up according to the regulations. Some of the huts at the front were ventilated; but not all on a sufficient scale, and there was no system. One medical officer had tried one way, and another had tried another; they had all found a defect, and had tried to do something. Those huts were covered with an impervious material—"felt," which was impervious to air for purposes of practical ventilation,—and many of the men had banked the sides of the huts up with earth. In the Highland brigade, in one regiment especially, they were shoved into the hill side, and in fact, every hut was a cellar-dwelling of the very worst description.

3306. (*Dr. Sutherland.*) What did they bank them together for?—Because the regulations told them to clear a site exactly the size of the hut, and when on sidelong ground the hut was buried.

3307. Did not they bank them up for fear of their being blown away?—No, I think not; but they would have been blown away if they had not holding down bolts or posts.

3308. (*Sir H. K. Storks.*) You say that the felt was impervious—did not the huts leak very much?—Some of them did.

3309. Where nails were used?—No doubt; the hut that I was under leaked, and I dare say they all did more or less—still the felt was impervious for any practical purposes of ventilation.

3310. (*Mr. Alexander.*) You stated that no huts were fully ventilated?—I must qualify that.

3311. When you visited the light division, accompanied by Dr. Sutherland, on the 27th of April, 1855, did not Dr. Sutherland acknowledge to me that, with regard to ventilation, everything was perfect, and that you could teach us nothing in the light division?—I think not. You will find in our report that we say that we had found, in one form or other, that ventilation had been attempted to be carried out, and that some of the plans were so good that we had very little to teach on that subject.

(*Dr. Sutherland.*) I must say, that Dr. Alexander's hospital huts were by far the best ventilated in the Crimea, for all practical purposes—they were ventilated enough—so much so, that we never suggested any alteration in his huts, as we did not consider any necessary. So well convinced were we of the excellence of his system, that we have given a sketch of his system, as illustrating the best form that was in use in that country. The system varied very much, according to the intelligence of the medical officers.

(*Mr. Rawlinson.*) I had in my mind another portion of the camp altogether, as in many of the huts there was no ventilation whatever.

3312. (*President.*) If fever occurs in any hut, what course ought to be taken?—According to my own experience, if fever occurs, and if there are healthy men

in a hut where there is fever, you must either shift the hut or thin the men, whatever the ventilation may be. A great deal depends upon the subsoil. In the 79th regiment, the huts were on a steep hill side, the regiment below it had little fever, and the regiment above it had little fever, but this unfortunate regiment had one half of its strength down in fever. But there was a clear reason for it, because each hut was a cellar dwelling. They were banked up the sides, and when one of them was cleared, there was as much water running away continuously out of the subsoil as would have filled an inch pipe.

3313. (*Mr. Martin.*) The want of drainage was the main fault?—Yes, and the want of fresh air. Again the men were sleeping near the wet and foul ground, and I think that where you have a damp subsoil, and you must necessarily occupy such a subsoil, the soldier should be raised, if only by a few rude tressels, some few inches from the ground, so that there should be perflation. That would be a great advantage.

3314. (*President.*) You are not acquainted with the barracks at home?—I have not inspected them officially, but I am acquainted with the defective state both of the drainage and of the privies at some of the garrison barracks,—for instance, at Plymouth, at Portsmouth, and at Woolwich, I inspected those towns officially, and there the complaints from the inhabitants as to the barrack privies were very strong. I went into several of them.

3315. Did you find that the complaints were well grounded?—Yes; the privies were merely cesspools—20 or 30 men sitting on a thing like a ladder, and the material remains in the cesspool for 12 months or more. There is a mistake that has been fallen into as to cleansing those places—we are told that they are cleansed by contract at certain intervals, that is to say, they are emptied, and it is presumed when that takes place they are cleaned. But many an empty cesspool is more injurious and foul than a full one. In the full one you have evaporation from the surface, but in the empty one you have evaporation from all the area of sides and bottom.

3316. Which are saturated?—Yes, and giving out foul gases; such a cesspool is in a worse condition for tainting a greater cubical amount of atmosphere. Some effective deodorizer should be used constantly to all cesspools, but especially during the emptying of a cesspool, and to disinfect the foul bottom and sides, as also the foul material taken out.

3317. *Mr. Alexander.* In all those privies you found them badly ventilated and badly lighted, did you not?—Yes, and what is I think quite as bad, the immorality of compelling men to expose themselves in numbers.

3318. (*President.*) In speaking of huts, without laying down any rules, it must be dependent in a great measure upon the negligence or otherwise of the commanding officer or the medical officer, as to the additional comfort and salubrity of them?—Yes, in some measure this will be so. We found one regiment at the front, an example of what may be done,—the 21st. Lord West was the colonel; the hospital huts were paved inside, and they were paved round the outside, so as to be clean and neat. There was also a convalescent seat prepared for the sick soldier on the shaded side of his hut, and they had loose hospital shoes lined with fur to slip their feet into when they were required to go to the rear. I think that if that was general, if a man, without injury to himself, could get out of his sick hut, and see the country and breathe the fresh air, it would be an immense advantage.

3319. This implies that it would be an advantage if the attention of both the commanding officer and the medical officer was more called in the course of their education to subjects of a sanitary character?—I am quite satisfied of that; but in saying this I do not wish my answer to carry with it what may be termed censure, because I really must bear my testimony to the indefatigable zeal of our medical officers in the East. I cannot say too much in praise of the medical

men connected with the army. So far as I knew them they were devoted to their men; they neither feared what is termed "contagious disease," nor a gunshot, nor anything else. I had the misfortune to be wounded, and there was a medical man with me within three seconds, and he was under the same fire that had knocked me over. I was taken to one of the hospital huts and attended to by the medical officer with the greatest possible kindness. There is one thing I would suggest, that in treating the men I think as much as possible the wards of the hospitals should be reduced in size, in making new ones a limit should be put to the size. I can speak from experience that the influence of a number of wounded men upon the feelings of one another must be very injurious.

3320. (*Mr. Stafford.*) About what number do you think would be sufficient for each ward?—If I might have my way I would never exceed twelve in a ward.

3321. (*President.*) You have had a great deal of experience in the working of the Health of Towns Act, have you not found among medical men and among the leading persons in towns quite as great a disbelief in sanitary measures, and quite as great an objection to adopt them as in the army?—Quite.

3322. And greater?—Yes.

3323. (*Dr. Andrew Smith.*) Did you ever find any disinclination to adopt sanitary measures in the army, or that any medical officer was opposed to them?—No, not as a rule; I never met with anything but attention from the medical officers generally.

3324. Admitting that to be the case, you would have almost ascertained whether medical officers had been disinclined by hearing their observations, or did you ever hear any medical officer say that he considered that it was not desirable to carry out to the fullest extent, sanitary measures?—There were two or three instances where medical officers did think or say that the sanitary commission had better have stopped at home. They seemed to think the commission was a censure on them.

3325. (*President.*) Is that as large a proportion as you have found in your experience in towns among civil practitioners who also doubted the efficacy of sanitary measures?—I think I have found it to a large extent among civil practitioners.

3326. (*Mr. Alexander.*) Did not you find that the medical men, generally speaking, in the front were alive to the necessary requirements for preserving the health of the troops by sanitary arrangements in the camp and so forth?—Yes, they did, and they complained to the Commissioners very strongly that they had not the power to carry out all that they saw was necessary and all that they had recommended before we went out.

3327. (*Dr. Andrew Smith.*) Did not the same feeling appear to exist elsewhere?—It did.

3328. On the Bosphorus was not the same disposition on the part of the medical officers shown to carry out sanitary measures as in the front?—Yes.

3329. (*Mr. A. S. Stafford.*) Did you have any intercourse with the soldiers?—No.

3330. You cannot tell at all what their feelings were towards their medical attendants?—Yes, I can. As I said before it was my misfortune to be wounded and to come under medical treatment at the front, and I can state that in that division in which I lay, from the officers to the men, the medical officers, if I may use so strong a term, were almost worshipped, idolized.

3331. On the whole can you speak most favourably of the philanthropy, the kindness, and the skill of the medical men?—I cannot find language strong enough to express what I think of our surgeons. I thought that they were labouring under some disadvantages, and I do not think they are in a right position in a regiment; I do not think that their feelings for their men are consulted sufficiently.

3332. Under these disadvantages they conducted themselves in a manner to win your warm approbation?—They did.

3333. (*Sir James Clark.*) From what you observed, do you not think that a medical officer appointed as a

general sanitary officer, would be useful for inspecting?—It would be an immense advantage, and not only a medical officer, but if combined with him there was a practical sanitary engineer officer, a man who had been especially educated, and whose duty it was to examine and inspect and to consult with the different medical officers of divisions having power to carry their requests or their opinions up to head quarters, so that a medical officer might get attention paid to his requirements, when perhaps his own colonel, who had so many other things to think of, could not listen to them.

3334. If such an officer had been appointed, do you think that many of the evils in the Crimea might have been mitigated or prevented?—I am vain enough to think that the sanitary commission did some good; but I think that all that good might have been done, by specially educated sanitary officers attached to the army. I think that the commissioners did certain good, because they had special knowledge and they also had special power; we had the means of getting the opinions of medical men, and of giving them assistance which they could not get through any ordinary course.

3335. What were your means of getting the evils corrected?—The means were simply our instructions and special knowledge; as, for instance, when we went out to the hospitals on the Bosphorus the ventilation was imperfect and we found the hospital privies disgustingly filthy, and the drains were in a neglected condition, in fact they were in this condition that one medical gentleman said, "if a change of wind occurs we have 50 or 100 men down with fever in one day, and what can sanitary men do for that?" Now there, simply covering the mouths of the sewers over the Bosphorus, which were exposed when the wind blew right up, and breaking holes external to the hospital walls to prevent the foul smell being driven in, entirely stopped that cause of disease at once, and then we ordered works to provide for full ventilation, which carried off the foul air from the wards, and thereby reduced the amount of foul air, giving the medical men a better chance with their patients. Then we had power to reduce the number of beds, which the medical officer had not; however his hospital was overcrowded he must work and abide the results, however fatal, (even to himself,) he could not thin them.

3336. My question was put chiefly in relation to the camp in the Crimea?—The report details more particularly the sanitary evils we found and the means we took to correct or to remove them. We found at Balaklava the harbour was very much crowded, and that the vessels were in the habit of throwing all their garbage and filth into the harbour, that was stopped; we found that the shore of the harbour was covered with garbage, and we found also that they were reclaiming a portion of the shore of the harbour to make wharfs, and they were doing that with the refuse of the town, and with dead animals, and that we put a stop to. Again, after the regulations had been issued, and we made a regulation that there should be no filth thrown into the harbour, we found one evil result from the effect of our own order. Having been out to the Black sea in a transport when we came into the harbour, with 350 head of cattle that had been on board a week, we found that the vessel might lie there a fortnight waiting orders before the captain could clean his decks, because of this order, and we immediately issued another, that he should bank his fires and run his vessel to sea after he had discharged his cargo, clean his ship, and come in again and wait for further orders. Now, no other person could have issued that regulation if it had not caught our attention.

3337. A sanitary officer would have looked to all that?—Yes; as it would be the duty of a sanitary officer to cause an inspection of all nuisances, to receive reports on all cases of sickness, especially fevers; and at once to investigate the conditions and to devise a remedy immediately. There was a question put to Sir Richard Airey about the cost of engineering

*R. Rawlinson,
Esq.*

29 May 1857.

R. Rawlinson,
Esq.

29 May 1857.

work, and having as an engineer had to do with large establishments, and having had to do with contracts, I may say that it is extremely difficult to draw the line, because you must have rules and regulations where you have an establishment, either civil or military, and the men get into a routine way of doing things, and you must suffer the consequences. Admiral Boxer in the harbour of Balaklava, with a few dozen jack tars made wharves almost as fast as an old woman could walk, but a military engineer must do everything by rule and square, and it costs guineas where the old admiral's work did not cost shillings, and, under the circumstances, one just as good as the other. I found the same at Sinope; an officer there,

Captain Hibbert, made a cattle wharf in about two months, by the aid of local labour and the rudest materials; it would have taken the engineers at Woolwich much longer, and have cost ten times the money. That is the fatality of routine, and I do not see how you are to get out of it, unless rules are relaxed at such times, and commanding officers and other officers are encouraged to think, and make the best of the men and material on the ground. All commanding officers should learn something of mechanics, road-making, well-sinking, timber-converting, &c., so as to be ready at expedients in a new country and under difficulties. Such information may be easily acquired.

The witness withdrew.

J. R. Martin,
Esq., F.R.S.

29 May 1857.

JAMES RANALD MARTIN, Esq., F.R.S., examined.

3338. (*President*.) You have been in the army medical service in India?—Yes, in the Bengal army.

3339. You have stated in a published work that—to the neglect of healthy localities for camps, stations, and cantonments; to the absence of proper structural arrangements in barracks and hospitals; to inattention to the suitable feeding and clothing, neglect in promoting better habits of life, absence of instruction in cooking, hutting, exercising, and bathing; to neglect of change of air and of climate in the remote stages of disease, we must refer the constant and great losses of the British army, especially in hot climates?—Those are, I believe, the principal reasons for the great mortality, especially in hot climates; I mention hot climates because the external causes of disease are there more emphatic than in temperate climates, but I would observe that even in temperate climates those circumstances which are referred to in the question are also very influential in producing disease amongst soldiers.

3340. How have cantonments been hitherto selected?—In India and in all our intertropical possessions they have been selected and fixed upon, and barracks and hospitals have been erected upon them at the instance of the general officer, the commander-in-chief, or the general officer of division.

3341. Without consultation with the medical officer?—Without any consultation whatsoever I believe. I have carefully studied the subject, and I do not remember an instance in which medical officers have ever been consulted on such subjects either in the East or West Indies.

3342. So far as your experience has gone?—Yes, and from all my reading.

3343. By placing neglect in the selection of healthy localities for camps and cantonments in the foreground, do you intend to attach the greatest weight and importance to that as a cause of sickness?—Yes, I do. In tropical climates especially, I believe of all the causes of sickness, neglect in the proper selection of camps and cantonments, and hospitals, is the greatest, and most influential. (*See App. XLII.*)

3344. (*Sir James Clark*.) Do you include barracks?—Yes, as at first stated, barracks and hospitals: all places occupied by soldiers.

3345. (*President*.) In the cases of ill chosen stations, on which a good deal of public money has been expended, can anything be done by art to remedy the defect?—Yes; a great deal can be done by clearing, levelling, and draining, and giving better supplies of water; and those other sanitary measures which are so well understood as preventive of disease among organized bodies of men.

3346. In future, as a means of prevention, in choosing new sites for camps, hospitals, and barracks, what arrangement would you propose with a view to secure healthiness?—I would propose first, in reference to the document that I have presented to you, that there should be in the army, both in peace and in war, a medical officer of health, the same as I

recommended to the Health of Towns Commission, which was adopted by them. A medical officer of health for the army, should, I think, be attached to the quartermaster-general's department, and should co-operate with the department of military topography in all instances, both in peace and in war, and where other more important reasons do not overrule him, his views and opinions should be heard and attended to.

3347. It is understood that you have proposed to the Indian Government that an officer of health should be appointed for the service of the Indian army. Will you state the nature of that proposal? (*Presented the following memorandum*): "It is proposed, 1st, that there be attached to the headquarters, and especially to the office of quartermaster-general, a highly qualified medical officer in the department of medical topography.

"2nd. That the duties of this officer in peace should be to examine and report on the proper sites, and on the sanitary condition of camps, temporary military stations, and cantonments—on convalescent stations and sanatoria—on the mountain ranges and solitary mountains of tropical climates, on the structure and arrangement of barracks and hospitals, and on everything relating to the health and comfort of the soldier.

"3rd. That in war such a medical officer of health should be attached to the quartermaster-general in the field, and be always in advance with this officer so as to be master of the medical topography of the scene of action.

"4th. That where military reasons of imperative necessity do not overrule sanitary considerations, the advice of the medical officer of health should be taken on the sites of camps, whether temporary or permanent.

"5th. That such an officer so highly qualified and possessed of suitable rank and station in the army could not fail to prove of the greatest service in peace and war in all countries, and that there has not occurred an expedition or campaign since the reign of William III., in which such an officer of health would not have saved thousands upon thousands of men. To furnish instances and examples is quite unnecessary, as they will present themselves by the score to the recollection of every well informed person."

3348. You propose that the medical officer should be consulted with regard to the site of all hospitals?—Yes.

3349. The site being determined, what would you recommend as to the proper construction of barracks and hospitals?—I would recommend that the medical officer should be also consulted upon all those matters, space, arrangement, and ventilation, &c.

3350. Do you consider convalescent wards necessary in hot climates?—Yes, I do, in order to separate the convalescent from the sick. I believe it has a moral as well as physical effect; it cheers a man to get out of the sick ward in which he has been seriously ill, and it supplies the *medicina mentis*, which is very influential.

3351. Does not that apply also to hospitals in temperate climates?—Quite so, and the more so when men are massed together suffering from contagious fevers.

3352. Where you have available space, would you always devote one ward or a portion of the space of the hospital to convalescents?—Invariably.

3353. (*Sir James Clark.*) Ought not the convalescent ward to be separated from the hospital?—Yes.

3354. (*President.*) What means do you consider practicable towards securing the benefit of change of air to sick soldiers in hot climates?—I think in most localities advantages are available when governors and commanders agree in having the thing done. On the seaboard of most tropical climates there are very desirable localities, and I may remark here that I observed in Bengal that sending a European for six weeks on a voyage to sea, was more influential in re-establishing his health and preventing the habit of recurrence of fever than six or eight months' residence in the mountain ranges. In tropical climates the influence of mountain ranges, whether continuous or solitary, will be most influential as preventive of illness, but for the cure of disease, and in maturing convalescence, the seaboard would be most influential where you can go to sea, or choose an insular position, which is the better of all. In returning on sick leave from the Burmese campaign, I passed the island of Negrais on the coast of Pegu, which had once been a British possession, and I recommended to the Government of India that it should be fixed upon as the great sanatorium for the European sick of Calcutta and Madras, being about equidistant from both. Circumstances prevented Lord Auckland, the then Governor-General, from entertaining it, although he made a systematic inquiry about it, but it has since been done by Lord Dalhousie, and a great city is going to be planted upon the coast opposite to the island to be called Port Dalhousie.

3355. In the West Indies the seaboard is not healthy I believe?—Where the land is low it is not healthy, but in the highest of the West Indian islands there are good sanatorial positions, in the mountain ranges; and where there are elevations of some 500 or 600 feet on the sea-board, those are generally good localities.

3356. Is there any distinction to be drawn between isolated mountains or portions of a continuous range?—That is a question which has not yet been determined, but I have a strong opinion, theoretically, that a solitary mountain is to be preferred, because it is an imitation of an island surrounded by water, it is better ventilated. I have an impression that that would be better than a spur or a portion of a continuous range of mountains.

3357. Referring to the proposal that you made for the Indian army, was it adopted?—No; Sir Charles, afterwards Lord Metcalfe, at the time it was submitted to him had carried into effect a very large sanitary measure which had been recommended by me for the improvement of the city of Calcutta, and for the improvement of the stations throughout the three Presidencies of India, and that supplemental part of it he had not time to consider when he was succeeded by a new Governor-General.

3358. Was no step taken to remedy those deficiencies which you pointed out?—Yes, the city of Calcutta has been under a systematic course of sanitary improvement for 16 years. The other suggestion for the improvement of stations and cantonments throughout India is in operation still. Sir Charles Metcalfe made it the law of India by ordinance.

3359. Was that done by the appointment of an officer such as you describe?—No; that special suggestion had not been adopted, but I have a firm impression that it is fully as necessary for organized bodies of men as for civil communities.

3360. (*Dr. Andrew Smith.*) With reference to the sanitary medical officer who you propose should be appointed in the army and to be attached to the quartermaster-general, would you also propose that he

should be independent of the principal medical officer of the army?—He should be entirely independent. I am convinced that the time has arrived when the department for the prevention of disease and that for the cure of disease must be separated.

3361. But there must be a great number of sanitary measures from time to time adopted in an army from occurrences which take place in that army, and which occurrences must necessarily only be known to some certain individuals, and how would he become possessed of the knowledge of what was taking place in the army, if he were independent of the principal medical officer?—An officer so highly endowed as he should be, and possessed of rank and position, should be a confidential sanitary officer, and should be held to be so by the commander-in-chief, and all the generals of division. His independence of the principal medical officer would constitute one of his advantages.

3362. How would he obtain his information as to the number of the sick throughout the whole army; would you have two heads, a sanitary medical officer to whom all medical officers were to send reports, as well as a second medical officer to whom they should also report?—I would have him in correspondence with the head of the medical department in that friendly way which should always take place between associated officers.

3363. Do you not think that that would lead to jealousy and collision?—I think the higher the officer is the more you diminish the chance of collision, jealousy, or petty feeling of any kind.

3364. Should he not be rather a field inspector attached to the principal medical officer of the army for sanitary and other field duties?—I think if he were attached, he should be attached to the quartermaster-general's department, as the medical topographer, the other being the military topographer of the army.

3365. (*President.*) Do you contemplate that he should be allowed to receive reports from the medical officers, as the principal medical officer now does?—I do not see why such should not be required by him in his department.

3366. He would have nothing to do with the treatment of the sick?—Nothing whatever.

3367. (*Sir H. K. Storks.*) He would be the mere medical topographer?—Yes; associated with the department of military topography, which I regard the quartermaster-general's department to be.

3368. (*President.*) He would be the preventive adviser of the commander of the forces?—Yes.

3369. (*Mr. Alexander.*) By visiting the camp he would see what sanitary measures were necessary?—Yes, and report accordingly.

3370. (*President.*) What objection would you have to his being placed as an adjunct to an army in the field, under the authority of the principal medical officer?—I think that for the sake of science it is desirable that the department which shall treat disease with a view to its cure, and the department which shall prevent disease, should be separated.

3371. (*Mr. A. S. Stafford.*) Surely they must have frequent intercommunication?—Yes; but the particular objects of both are different, and I think they should be separated and distinct departments, and they are held to be so in civil communities.

3372. (*Sir James Clark.*) You do not mean to say that in private life the sanitary officer and the physician would be separated?—For organized bodies of men they should be separated; for all communities and cities, such as for the city of London, the medical officer of health is a separate functionary; he does not treat any person in his sickness.

3373. (*Dr. Andrew Smith.*) If your suggestion were adopted the general commander-in-chief would be receiving reports from two officers—from the medical gentleman attached to the quartermaster-general, and from the principal medical officer of the army, and in that case supposing their opinions differed, to which of the two should the Commander-in-Chief attach importance?—I apprehend that in that case he

*J. R. Martin,
Esq., F.R.S.*

29 May 1857.

J. R. Martin,
Esq., F.R.S.

29 May 1857.

would receive his reports from the department that was employed for the treatment and cure of disease, as he does now, but superadded to that, he would acquire, from the proper source, an amount of sanitary information which is essential to the welfare of armies, and to the commander's success.

3374. Suppose a disease of a serious nature breaks out in a brigade now, the principal medical officer would immediately detach an inspectorial officer of the brigade or the division to examine into it, and remedies would be applied or recommended as soon as possible; but in the other case, who would communicate to the sanitary medical officer that such had occurred, and that it was necessary for him to go and see what was to be done?—He, as a superior staff officer, would be every day moving about the camp, and would be cognizant of everything, and in going about he would be in personal communication with all classes of medical officers, as well as with those of the quartermaster-general's department, and nothing could remain unknown to him and he would be the proper referee for the application of the means of prevention.

3375. (*President.*) Do you contemplate that the commanding officer of the troops shall cease to communicate with his principal medical officer as to the means of prevention when he has this sanitary officer attached to him?—Yes, absolutely.

3376. It would then become very possible, would it not, that he might be taking the worst opinion, and never hearing the best?—No, I think it would be a matter of no great difficulty to provide that the medical officer of health should be the highest

sanitary officer in the country—certainly the highest in the army.

3377. Has not the chief medical officer in the army a greater interest than any one else in the condition of that army, and in the state of its health?—All medical officers of character have a common interest in the soldier's welfare; but the principal medical officer has such a variety of duties to perform of every kind, that I think it is for the good of armies that he should be relieved of this great sanitary office, and that it should be transferred to a special officer, as it is in civil communities.

3378. Might not a special officer relieve him of all those duties, and have a right of personal access to the quartermaster-general, but still be attached to the department of the principal medical officer, and be under his authority?—He should be in co-operation with him, but my personal impression, on mature consideration is, that he should be separate and distinct. I beg leave to add one remark in reference to what we so frequently hear officers in command speak of, namely, the over-ruling influences of military considerations. At this moment I can hardly remember any consideration, apart from active military operations, which should over-rule sanitary considerations—the health of the soldier being the first of military considerations in my opinion; and I am further of opinion that some grave responsibility should attach to the unnecessary sacrifice of health or of life by officers in command.

3379. That is putting aside strategic considerations?—Yes.

Adjourned to Monday the 8th of June.

Monday, 8th June 1857.

PRESENT :

The Right Hon. SIDNEY HERBERT, M.P.
A. S. STAFFORD, Esq., M.P.
Sir H. K. STORKS, K.C.B.
Dr. ANDREW SMITH.

Sir THOMAS PHILLIPS.
Sir JAMES CLARK, Bart.
J. R. MARTIN, Esq., F.R.S.

President, the Right Honourable SIDNEY HERBERT, M.P.

Colonel FREDERICK EDWARD CHAPMAN, R.E., C.B., examined.

Colonel F. E.
Chapman, C.B.

8 June 1857.

3380. (*President.*) What rank do you hold in the Royal Engineers?—Captain and brevet colonel.

3381. You are in office in London, are you not?—I am commanding engineer in the London district.

3382. Does that give you an opportunity of seeing the manner in which the business is conducted as regards the repairs and construction of hospitals?—In London we have very little to do with hospitals. Most of the hospitals in London are taken up by the Guards, and we have nothing to do with them.

3383. Your district extends beyond London, does it not?—Windsor and Hampton Court. I have a few hospitals.

3384. Can you describe to the Commission the course of a requisition from the principal medical officer to the engineer department for some small repair or alteration required in a barrack?—Yes.

3385. What is it?—If a repair is required to be done immediately, an urgent repair, a requisition is sent by the principal medical officer to the barrack-master at the station, and he inspects the repair and sees what is required, and satisfies himself that it is a repair done by fair wear, and that it has not been done by the troops wilfully damaging the building or a portion of it, and then he forwards it to the commanding engineer.

3386. So that the barrack-master in the first instance exercises his discretion as to the necessity of the repair?—He can hardly be said to do that; he

merely exercises a discretion as to whether it has been wilfully damaged by the troops or caused by negligence, or that it ought to be repaired at the expense of the government.

3387. However caused, the repair would be executed?—Certainly; if it was a wilful damage the barrack-master would have it done and charge it as against the troops.

3388. His business is not to see and examine as to the necessity of the repair being made, but as to whether it has been caused wilfully or by fair wear and tear, with a view of charging it to the government or to the individual supposed to have done the mischief?—Exactly so.

3389. When the requisition comes to your department, what steps do you take upon it?—In an urgent case I should send an officer, either military or civil, to examine into the extent of repair required, and to take notes for ordering it from the contractor, and I should then send a written order to the contractor giving him the detail of what was required. If necessary it would be pointed out on the spot by the foreman of the works. The repair is then executed under the direction of the engineer department in the usual way.

3390. Is that a standing contract?—We have always a contract triennially taken for the repairs of all the districts. We charge so much according to a schedule of prices.

Colonel F. E.
Chapman, C.B.

8 June 1857.

3391. Are the works executed by measurement?—Whenever it can be done.

3392. In the erecting of new buildings I can understand how it is that you can measure, but how is it for work done as repairs?—Suppose a part of this ceiling was down, you would measure it at once; so many square feet.

3393. Have you got a schedule of prices for such minute details?—Yes, everything is done by the foot.

3394. Suppose it was the repair of a pipe?—Yes, the same for that and even for junctions.

3395. And for waterclosets?—No, you cannot very well do that; it is generally time and materials.

3396. (*Mr. A. S. Stafford.*) How often is the scale of prices changed?—Once in three years.

3397. Do they hold good for every particular locality?—They are different for every locality; and they are revised once every three years.

3398. (*President.*) The prices are fixed by competition within each locality?—We make a schedule, according to the London builders' prices, and contracts are taken so much above or so much below. We call for tenders.

3399. And the prices of the London builders you have for your own guidance?—Yes; we are much about what it would be by the London trade prices. Our schedules are based upon those.

3400. Do you find generally in the country that the prices are lower?—Decidedly; especially for labour and artificer's work.

3401. (*Sir Thomas Phillips.*) Suppose work to be done for which no price is fixed; how is that adjusted?—We settle it according to the trade price.

3402. Who settles it?—The engineer officer is the arbiter between the contractor and the executive officer on the spot, and they agree on the price, generally speaking, beforehand; and if there is any doubt about it, it is submitted to the commanding engineer, and he decides.

3403. So that the government officer is the ultimate arbiter?—Yes.

3404. You do everything by contract?—Yes.

3405. Not by your own men, the sappers and miners?—Not in London; I have not one.

3406. Do you prefer the system of open tender to having a list of respectable tradesmen?—No. I would sooner have a list of respectable tradesmen, if I could get it.

3407. Do you find, practically, that men who underbid do the work badly?—By the present system I think we get a number of small tradesmen tendering for work, where the large tradesmen, Mr. Cubitt and others, are shut out in consequence of a few small tradesmen putting in smaller prices.

3408. But for small repairs and so on, for which there is a separate contract, those, I suppose, are such as a house like Cubitt's would not engage in?—I think not; it would be very desirable to get a house like Cubitt's to take the whole of the contracts for a district. You would have only one man to deal with, whereas now I have a dozen.

3409. Who draws up the contracts?—The contracts are all made by the director-general of contracts.

3410. Who superintends the execution of the work?—The engineer officer, assisted by the civil branch.

3411. What is that?—The clerks of the works and foremen.

3412. Do you send one upon every occasion, for every small repair?—Very nearly. We do not always have repairs come in every day; we try to keep them for once a quarter. The barracks are always inspected once a quarter by the engineer officer.

3413. So as to concentrate the repairs under the superintendence of one man, as much as possible?—Yes.

3414. (*President.*) Does not that produce a great deal of delay in an hospital, for instance?—Yes; sometimes in this way. After the engineer officer and barrack-master have gone round once a quarter to inspect, the following day some more requisitions

will come in for other repairs, which, through carelessness on the part of the people occupying that hospital, had not been brought before the notice of the officer of engineers at his inspection. We go round with a long list furnished by the barrack-master, and the officer of engineers inspects every item, and adds anything that he sees necessary; but there are many things that might very possibly be missed by the engineer officer.

3415. You depend upon the medical officer for that?—Certainly.

3416. Does he accompany the barrack-master?—Sometimes he does and sometimes not.

3417. Because the barrack-master can only know what things have been represented to him?—He is bound to know where every individual repair is required.

3418. He does not originate any complaint in the hospital? he only deals with those brought under his notice by requisition?—No; those requisitions are made by the officer in charge, and generally speaking it is done by the quarter-masters of the regiments.

3419. But, referring to the general hospital at Chatham, how is it?—There I should say that those lists are made out by the senior hospital serjeants, and sent in by the principal medical officer.

3420. (*Sir H. K. Storks.*) Is the barrack-master required to make an inspection?—Yes, once a month.

3421. (*President.*) At that time any repairs which had accumulated during the month would be brought under his notice?—Yes.

3422. You have stated what you do with respect to alterations when they are slight, and repairs of no great importance; where there is a new erection required or a work of considerable magnitude, what takes place then?—Where there is a new erection required, probably the principal medical officer would make a requisition on the director-general of the medical department for the new work or the extensive alteration required. The director-general would then communicate to the inspector-general of fortifications, who would forward the requisition to the commanding engineer of the district with an order to prepare plans and report an estimate; and when those plans are ready, with the estimates, they would be forwarded to the inspector-general of fortifications; I conclude that he would confer with the director-general of the medical department, and when they had settled between them the nature of the building, or whether the plans would answer, they would be submitted to the Secretary-of-State for War, and if the Secretary-of-War approved of them, an order would then come to the commanding engineer either to call for tenders for the erection of the building at once, or if funds are not available to bring them forward in the next year's estimate.

3423. You referred to the regimental hospitals within the barracks, is the process the same?—Yes, except that the requisitions are signed by the commanding officer of the regiment.

3424. He makes the application instead of the medical officer in charge?—Yes, inclosing the medical officer's requisition in all cases.

3425. (*Sir H. K. Storks.*) Are the commanding officers required to give any report containing suggestions for improvements in barracks and hospitals?—Yes, every year previously to the formation of the annual estimates.

3426. At all the stations?—Yes.

3427. What becomes of those reports?—They accompany the estimates submitted to the Secretary-of-State for War.

3428. Are the suggestions or requisitions carried out?—If they are not carried out the commanding engineer's reasons are always supplied.

3429. Supposing the commanding royal engineer or inspector-general of fortifications approves of a suggestion for an improvement in a barrack or hospital, does it follow that it will be adopted?—No, not if the inspector-general approves of it; it is a finance question then.

Colonel F. E.
Chapman, C.B.

8 June 1857.

3430. Then it goes to the Secretary-of-State?—Yes.

3431. (*President.*) In the first case you mentioned, that of an ordinary repair, does this process produce delay?—There is delay if the repairs are not noticed; as I said before, if the inspection is made to-day and another requisition comes in to-morrow that ought to have been foreseen, then there is a great deal of delay.

3432. Or that could not have been foreseen?—Yes, there must be some delay then.

3433. That is, it will be delayed till the next inspection of the barrack-master?—Not with a hospital; with a hospital we generally attend to the requisitions as they come in, and have them included in the next return, so as to be a voucher to cover our expense.

3434. What causes the delay; has it to go through a number of departments?—It has to go from the surgeon to the barrack-master, and then to the commanding engineer.

3435. From him does it go further?—Then he has to measure and make out the details for ordering this work.

3436. (*Sir H. K. Storks.*) Would he execute it upon his own responsibility?—Yes; in a small repair we have an item in the estimate for it.

3437. Supposing a very offensive drain in a barrack, that required a considerable outlay to cleanse it, would the commanding royal engineer, when the requisition arrived with him, consider himself authorized to execute it?—Not unless he had funds to pay for it.

3438. (*Sir Thomas Phillips.*) Suppose he had not?—Then he would report the expense to the inspector-general of fortifications.

3439. What would the inspector-general of fortifications do with it?—Then it would go to the Treasury, through the War Office, if over 200*l.*

3440. (*Sir H. K. Storks.*) And then what is done?—I think that for anything over 200*l.* you go to the Treasury.

3441. (*President.*) Do you see any means of altering the process?—I am not prepared to say that I do know of any.

3442. Could you not simplify the process without interfering with the financial check?—I do not think that you could very well simplify it.

3443. (*Dr. A. Smith.*) Might it not be simplified in this way; that there should be a certain amount of money allotted every year for hospitals only, and that that fund should exist and remain solely for hospital purposes?—We have always had a contingent item for hospitals; there is always a certain allowance for hospitals every year.

3444. Specially for hospitals?—Yes.

3445. Unconnected with barracks?—Every item required for a hospital is taken up in detail for it in the annual estimates.

3446. Suppose that a certain amount, such as is shown to be required, shall be available to be expended upon hospital repairs during the current year, there would be no necessity for correspondence at all, if the money was not exhausted?—Yes; there is no necessity for correspondence as long as you can keep within the money allowed by Parliament. It is when there comes an extra thing, such as a large drain to be cleaned out.

3447. (*President.*) But there is still correspondence, though there is not money to be spent; the medical officer cannot get a repair effected without making a requisition upon the barrack-master who writes to the engineer?—Yes. If you choose to put a special item at the disposal of the commanding engineer to cover extra contingencies it might simplify the thing, but then it would run up your estimates enormously by that means.

3448. (*Dr. A. Smith.*) At the present time there is no sum of money set apart for hospitals; hospitals and barracks are included in the same grant, and if the barracks require a greater expenditure the hospitals

necessarily suffer?—I think it is just the other way. I know that, so far as my experience goes, whenever there has been money available, we have always spent it first on the hospitals.

3449. (*Mr. A. S. Stafford.*) And you have let the barracks wait?—They must wait. If we get a requisition from the surgeon, saying that so and so is absolutely necessary, if we have the money we do it.

3450. Would there be any advantage in the distribution of the vote between the hospitals and barracks, giving a certain sum to either?—I do not know. In the present case we might sometimes have a saving on the barracks that we can apply for the hospitals.

3451. (*President.*) And it might be *vice versa*?—Yes; but in the other case, if you only allowed a certain sum for hospitals, when that is expended our hands would be tied for the remainder of the year.

3452. (*Mr. Martin.*) Meanwhile the sum set apart by the Government for contingent repairs for any one hospital or barrack amounts to 200*l.* a year, and no more?—No; if you want any specific item done that has not been foreseen in the grant of Parliament, and not in the estimate.

3453. (*President.*) If it does not exceed 200*l.*, you can execute it?—The inspector-general may order it, not the commanding engineer. Suppose I have a contingent item for the repair of hospitals in London, amounting to 200*l.* a year, and suppose a large drain required cleaning out, at a cost of 150*l.*, I could not expend that 150*l.* on my own authority, for I should only have 50*l.* left to keep the remainder of the hospital in repair. I should be bound to apply to the inspector-general of fortifications for an extra sum.

3454. Your impression is, on the whole, that in the clubbing together those two votes it more frequently occurs that the money originally intended for barracks is diverted to hospital purposes, than that the money that is intended for the hospital is diverted to barrack or fortification purposes?—I should say so, certainly.

3455. Could you get from the War Department a return showing the manner in which the money has been spent upon both?—I should doubt if you could.

3456. Could you from the engineers' department?—It would take some time; you must hunt through the whole of the bills for any twelve months, that you might call for and separate them all.

3457. (*Sir Thomas Phillips.*) Do not your accounts which are sent to the department distinguish what you have spent upon the hospitals, and what upon the barracks?—No. Every item is distinguished, but our incidental would not show it; our incidental item is for all the different trades; they are sent in in one bill.

3458. There is no analysis—no division of it?—We could make an analysis by going through the details in the district office; they are all retained there.

3459. I understand that the report is made of the money required for the work to be done?—It does not always come up to the estimates for the district, framed on the requisition of the medical department there; I dare say if you took the hospitals throughout Great Britain you would find that there was ten times as much estimated for as is allowed in Parliament.

3460. (*Mr. A. S. Stafford.*) They are cut down at head quarters?—Yes.

3461. (*Sir T. Phillips.*) I mean this, that Parliament at last simply sanctions the expenditure of a certain sum which is settled with reference to a certain report of the work then required to be done; it is not a prospective provision?—It takes both cases in.

3462. Prospective as well as retrospective?—Yes.

3463. How is the prospective vote framed—with reference to what data?—I do not quite understand the question.

3464. Say that there is wanted 500*l.* for a hospital, that it is now needed, but you also say, that Parliament sanction the expenditure of 700*l.* or 800*l.* under the idea that there would be a further expenditure required during the year; is that so or not?—The

way an estimate is made, is this ; requisitions are sent in for things known by the people occupying those hospitals to be necessary.

3465. At that time necessary ?—Yes ; a commanding engineer goes round, and sees that a certain roof will only last another year, and he provides for that also, so that it is not only the repairs absolutely necessary then, but what may be required after another twelve months.

3466. Suppose that Parliament came to a vote in May, in reference to a certain estimate then supplied, and suppose that an engineer officer goes round in August, and finds that there has been between May and August an injury done in various respects, or certain things have presented themselves as necessary, in what shape is provision made for that subsequent want ?—In the case of a storm, for instance, a special report and estimate would be forwarded.

3467. And that though there has been no provision made by Parliament for it, upon the authority from the Treasury ?—Yes, as soon as they grant the money.

3468. (*President.*) At the end of the year, if, on account of that extra expenditure, the vote was exceeded, application would be made to the Treasury to sanction the saving upon some other head, to be turned over to the excess upon that one ?—Yes, that is quite the case. There is vote 12 for this year ; there may be a good number of buildings within the year. If they could not be completed under vote 12, and the money could not be paid on the 31st of March, the money would be a saving. Then there are a great number of unforeseen cases, like those that have been instanced, in which the Treasury have to provide the money, and they charge it against vote 12, the aggregate being voted by Parliament.

3469. (*Sir Thomas Phillips.*) It being of that class ?—Yes.

3470. (*Dr. Andrew Smith.*) But is it not the usual practice as to hospitals, about three months previously to the army estimates being prepared, to send round to all the general hospitals for the principal medical officers to state what they consider is likely to be necessary during the current year for the repairs of the hospital ?—Yes.

3471. And then is it not the practice to send that in, with any additions that the commanding engineer may make to it ?—Yes ; that is, a requisition is sent in to the commanding Royal Engineer, who makes any additions that he likes, which he forwards, and in reporting on the different items of the estimates he alludes to the requisition of the principal medical officer for what is required to strengthen his report.

3472. Does it not very frequently happen that what the principal medical officer requires, and the estimates show will be necessary to meet the expense of the year, are not given by a half ?—You may say by one-fourth.

3473. (*President.*) Are you aware of the practice in the Naval hospital,—for example, at Melville hospital, at Chatham,—that the medical superintendent of the hospital writes up to the officer corresponding to the director general of the army, Sir John Liddell, and gets his sanction to have such and such a work executed, which he then has executed under contracts made by himself ?—I am not aware precisely of the method in the navy.

3474. (*Dr. Andrew Smith.*) Looking at the service, do you see any reason why such a course should not be followed in the army ; would the service suffer by it ?—I think that the medical officer in charge of the hospital would be rather going out of his line if he had to superintend, and to judge whether the repairs were properly done or of good materials.

3475. Supposing a person was appointed for that purpose, a professional man, who would carry out the repairs, and be in every way responsible that they were properly executed, would any disadvantage to the public service result from that course ?—I cannot answer that ; I do not see that there would be any advantage in it over the present system.

3476. Would there not be this advantage, supposing the principal medical officer now at Chatham found there was anything very necessary to be done, and he was anxious to have it done, then the commanding engineer, with every desire to do what was wanted, if he had not the money, would require to correspond with the head-quarters, and the head-quarters would most probably have to correspond with him again, and then his second explanation would come ; then they would correspond with the Minister of War, who would have to correspond with the Treasury, and during this time a great deal of mischief would result, say at Fort Pitt ?—You would only get rid of one department after all.

3477. If a certain sum of money was appropriated annually for hospital purposes, taking the last ten years as a guide, and if that sum was estimated in Parliament as being probably required for 1858–1859, and was put into the hands of Sir John Kirkland or any other authority that the Government fixed upon, and that the principal medical officer, aided and assisted by a clerk of the works, or whatever his appointment might be, went and made all necessary repairs when required, so long as he had money, it would expedite very much the repairs and there would be no correspondence wanted then ?—There is none wanted now, if you have the money.

3478. (*President.*) But there is correspondence necessary between the department for whom it is to be executed and the department by whom it is to be executed ?—There is not much loss of time by that.

3479. (*Dr. Andrew Smith.*) It appears to me that the two are lumped together ; that the barracks and hospitals are not virtually separated at present. If there is a commanding engineer, say at Colchester, who is influenced a good deal by the commanding officer at Colchester, he might supply those things required for the barracks that he perhaps would not do for the hospital. There is an influence, is there not, that can be exercised, and more money may be expended upon the barracks than is to the advantage of the hospital ?—I do not admit that the commanding engineer is influenced in that way, but in nine cases out of ten it is the other way, if any influence is brought to bear upon it.

3480. (*President.*) Should you not say that the officer responsible for the appearance of certain buildings is more likely to favour them than buildings belonging to another department, and for which, when they are inspected, he is not held responsible ?—The engineer officer takes just as much pride in keeping up the appearance of the hospital as of the barracks.

3481. He is not there when the hospital is inspected, is he ?—No, nor is he when the barrack is inspected.

3482. Is he not ?—No ; but if he is wanted, it is just as much his business to be there. Do you mean at the annual inspection ?

3483. At any inspection by a general officer ?—He can always send for the engineer officer.

3484. Practically, have not many more barracks been built in England in the last 10 years than hospitals ?—I cannot say. I should say that there has always been a hospital built with the barrack.

3485. Wherever there has been a regimental barrack ?—Yes.

3486. (*Dr. Andrew Smith.*) With reference to regimental hospitals, would you say from your experience that the hospitals built for regimental hospitals were always equal to the purpose for which they were built ?—No, because you have changed them about so now. If you take Chatham, for instance, you have taken Fort Pitt, which was a barrack, and fitted it up as a hospital. You have taken the Brompton hospital, which was the ordnance hospital for a small number of men, and you have made it hold a large number of men, by putting an extra story on ; but your premises are not in proportion at all with the size of the hospital.

Colonel F. E. Chapman, C.B.

8 June 1857.

Colonel F. E.
Chapman, C.B.

8 June 1857.

3487. (*President.*) In those two cases the hospitals have been treated as a secondary service, and they have not had buildings suitable to their wants?—It has been on the saving principle.

3488. (*Mr. Martin.*) There is no fixed or standard plan?—In those two hospitals there certainly is not. They have adapted those buildings at a cheap rate, as a makeshift. I look upon both as makeshifts.

3489. Though they are the chief military hospitals of the station?—Yes. One of them, the Brompton one, was a very nice little hospital for the force, as I recollect it 20 years ago, an Ordnance Hospital, when we had about two companies of sappers down there, and a detachment of artillery, and one surgeon lived on the spot.

3490. (*Dr. Andrew Smith.*) But with regard to our regimental hospitals, the regiments being scattered all over England, do you think that the hospitals are at all such as they ought to be, considering the strength of the corps to be accommodated in those barracks?—I do not know anything about the hospitals in England; I have had very little service in England; except in London and Chatham.

3491. (*Mr. Martin.*) When you have original errors to contend with, such as adapting a public or a private residence for a hospital, is it not a matter of great engineering difficulty to make them good hospitals afterwards?—Yes; if you adapt one building for a purpose that it was never intended for, you are sure to make a mess of it.

3492. You have always original errors to contend against?—Always.

3493. (*Sir Thomas Phillips.*) You spoke of Brompton, how different is the scale upon which it is now used as a hospital?—It takes the whole of the provisional battalion, if I recollect rightly, by an additional story being added to it.

3494. As I understand you, the space of ground attached to the hospital has not been enlarged?—The outbuildings, waterclosets, offices, and those sort of buildings remain the same. It was a very nice little hospital originally.

3495. (*President.*) It is not a mode of construction for a hospital which you would adopt now?—Certainly not.

3496. As to its plan?—No, certainly not.

3497. You state that the estimates are submitted to the director-general before they get the approval of the Secretary of State?—Yes.

3498. Afterwards, if the whole amount of the estimates is objected to, the practice of the Treasury is to send them back to be reduced, is it not?—I believe so.

3499. Through whom is that reduction effected?—I believe that is done at the inspector-general of fortifications office.

3500. And probably the inspector-general of fortifications goes to the Chancellor of the Exchequer and explains what items he cannot give up?—I think that is so.

3501. You do not know whether that is the case with the director general?—I do not know.

3502. Are you aware whether the director-general also is consulted with regard to items which affect the hospital expenditure, and which are contained in the gross estimate of the inspector-general of fortifications?—I am not aware of that.

3503. (*Sir Thomas Phillips.*) Do you in fact know that items which are regarded as essential by the inspecting officer are disallowed on financial considerations?—Our estimates are generally very large indeed. I believe the hospital estimates last year were something like 2,000,000*l.* and I think you will find it is not above a fourth of that.

3504. I want to know whether the disallowance proceeds upon a judgment that the work is not necessary to be done at all, or for financial reasons which render it inconvenient to undertake the expenditure?—I suspect it is for financial reasons, generally speaking; every year our wants are much greater than are supplied.

3505. (*Mr. Martin.*) In proceeding to construct a new barracks or hospitals, should you consider it advisable that the barrack and engineer departments should have before them standard models and plans of the best known buildings of the description mentioned?—I think it would be very advisable that in a case of that sort for new buildings or hospitals, some plans or models of a particular system should be submitted for them to work by, as near as the ground would admit.

3506. For the purposes of estimates and comparison?—Yes.

3507. Would not the placing of such models in barrack and engineers' offices at head quarters tend greatly to the perfection of plans for future buildings, it being understood that models of all improvements shall from time to time be presented by the authorities?—It is hardly necessary to have models; plans might be very useful.

3508. Would not such models be as useful towards perfecting the plans of public buildings as towards perfecting fortified works?—I suppose they would.

3509. (*President.*) Can you state whether or not medical officers are consulted as to the sites of hospitals or barracks?—I believe they are.

3510. Are they consulted at all as to the plan?—I should consult the medical officer as to the plan of a hospital, but not as to a barrack.

3511. Do not you think it is the business of the medical officer to keep the men in health and to prevent their getting ill?—Yes, but if you have a good site, I think that the engineer officer and the military officer are quite able to determine on the plan of a barrack without any assistance from medical men.

3512. Do you think that the existing barracks are constructed with sufficient regard to ventilation and drainage?—Not the old barracks, certainly not.

3513. (*Sir H. K. Storks.*) Would you not consult the medical officer about ventilation and drainage?—No, I think that is an engineering question.

3514. (*Mr. Martin.*) You regard them as engineer's questions?—Totally. As to ventilation, we know that there are 50 different opinions how that is to be done.

3515. (*President.*) The result is very often that it is not done at all;—I think that we give some ventilation now; but take half a dozen people in a room, I will undertake to say that they will not agree on the subject of ventilation.

3516. (*Mr. Martin.*) As a question of science, true ventilation is still a desideratum with engineers?—Of course it is.

3517. (*President.*) With soldiers you have this difficulty, that the ventilation which depends upon open windows, it is always in their power to shut out?—They always will shut out even the ventilation that you give in walls or in any way, they will stop over all the ventilators during the winter with pasted paper, or something of that sort.

3518. Do you recommend artificial ventilation in addition to the windows and doors?—I would prefer having the ventilation exclusive of the windows and doors, and altogether independent of them.

3519. What is your notion as to the best principle of ventilation?—I prefer carrying up the ventilation by hollow flues in the walls.

3520. Would you have gratings admitting the air underneath?—Yes.

3521. Do you have any through the beams?—Through the rafters; between them in all cases, and also taking ventilators from the centre of the roof as well as the sides, and taking off the whole of the foul air through those tubes conveyed in the main or party walls of the buildings.

3522. You have a hollow rafter stopped in the centre, so that the wind blows in always from the windward side, and is not carried through to the leeward?—That is the principle that they have in some of the barracks.

3523. Does that plan answer?—It does if you pay attention to it, but it is nobody's business to do it.

Colonel F. E.
Chapman, C.B.

8 June 1857.

3524. What attention does it require?—You require to have one side left open—the windward side.

3525. But if left open at both ends, but closed in the centre, then the wind will only come in one way?—Yes, and out the other.

3526. No, being stopped, it comes into the room?—It may be a good plan, but I prefer the air coming in, not directly from the outer air, for you get such a tremendous draft, and they would immediately stop up the ventilation.

3527. You have inspected the Chelsea Asylum, have you not, with a view to convert it into a barrack?—Yes.

3528. Did you observe the cooking apparatus?—Yes; I think it is very good.

3529. In what respect is it better than the existing one?—You have large boilers there, and you bring down a certain number of messes—I think I am right in saying so—and you place them in, and they are cooked and then taken away to the messes at once.

3530. (*Sir Thomas Phillips.*) In what does the superiority consist?—Everything is so simple, and it is easily managed.

3531. (*President.*) It gives you the means of various modes of cooking; you can bake and fry, can you not?—Yes; bake as well as boil.

3532. And fry?—Yes, I suppose they can.

3533. How is it as to the consumption of fuel?—I do not know.

3534. Should you recommend that in a barrack rather than the existing system of coppers?—The soldiers like the existing system of coppers.

3535. Why?—Each company has a couple of boilers handed over to it, in one of which they cook the potatoes, and in the other the meat. Not long ago we tried another apparatus, Captain Grant's, for cooking, but the soldiers did not like it at all.

3536. (*Sir H. K. Storks.*) Do the men like the cooking only in one way?—What they like, is cooking by gas; it gives no trouble. They like to have their meat baked certain days, and roasted.

3537. (*President.*) Do not they like the present system, because they get some of the fuel?—Yes, they get a good deal of fuel.

3538. They save the fuel, and then distribute it to the married men, do they not?—Yes; I was in this district 14 years ago, and we fitted up a steam apparatus like that at Chelsea, in the Wellington barrack, and one battalion of the Guards liked it uncommonly, and they cooked for the whole regiment with two men attending one fire, but the next battalion would not have it at all.

3539. (*Mr. Stafford.*) Was it merely boiling?—Yes, by steam, and it was pulled down.

3540. (*President.*) Were there any means of baking?—No, I think not; and the next regiment that came in had it pulled down. The old coppers were substituted, and there they are now.

3541. (*Sir H. K. Storks.*) How did they get pulled down?—With a little pressure from the authorities.

3542. (*Mr. Stafford.*) Did the men protest against it?—Yes; they could not get any spare fuel for the married people, and that apparatus was pulled down and sold.

3543. Has one battalion more married men in it than the other?—I do not know that.

3544. (*Sir H. K. Storks.*) Under whose authority was it pulled down; was it under the authority of the Inspector-General of Fortifications?—The Ordnance must have sanctioned it on the representations of the commanding officer of the guards.

3545. (*Sir Thomas Phillips.*) You spoke of a roasting apparatus at Chelsea; is that supplied with gas?—No.

3546. (*President.*) As the result of your own experience, should you say that buildings constructed by your department are cheaper or dearer than those done ordinarily by contract?—I should say that they are cheaper.

3547. It has been stated to the Commissioners that at Chatham some things have been estimated for, such as painting and so on, by engineer officers, which tradesmen of Chatham offered to do for less than a third of the amount?—Very possibly, by putting inferior materials in with the painting. Instead of putting linseed oil, they put any stuff they can get hold of.

3548. In cases where your work is dearer you think that good results from the use of the best materials?—Yes.

3549. Do not you sometimes go too far in that respect?—I do not think we do.

3550. In building the different military chapels of late years, are you aware that when done by contract they have been done cheaper than by the engineers?—Generally a specific contract is taken under our estimate, and sometimes it falls over; it is according to the market price of materials, the labour being much about the same.

3551. In cases where it is dearer you attribute it to your more solid construction and so on?—Yes; our estimates are all based upon actual measurement, and the prices taken at the schedule prices on the spot are framed from experience on the spot, and therefore there cannot be much mistake about the estimate.

3552. (*Sir Thomas Phillips.*) Do you ascertain your quantities yourself?—Yes, every single thing is brought up.

3553. (*Sir H. K. Storks.*) What means do you give the men for washing themselves in the new barracks which you construct?—The water is laid on in large washing rooms. I have just been completing some barracks with washing rooms in the basements and baths.

3554. In the London barracks?—Yes.

3555. What barracks are those?—The Wellington barracks.

3556. Is it only so in the Wellington barracks?—I think in all the barracks in London. I have just completed the Wellington barracks, and they have a very large supply of water.

3557. In other respects in the barracks both at home and abroad there is no convenience of that sort?—In all barracks, both at home and abroad, there are ablution rooms. I think the order came out in 1841, and they have always had them since that date.

3558. (*Mr. Stafford.*) Is that the case in Ireland as well as in England?—I do not know.

3559. (*Dr. Andrew Smith.*) Have you anything to do with the Hounslow barracks?—Yes.

3560. Do you know why there was an objection to give an ablution room at those barracks, compelling the men to continue washing in the dead-house?—The men do not wash in the dead-house. There was a dead-house built there before I came to the district, two years ago.

3561. It was on the ground of expense, was it not?—I do not know; I cannot speak to that.

3562. (*Sir Thomas Phillips.*) Do you say that there is an ablution room there?—I say that the men do not wash in the dead-house.

3563. You do not know whether there is an ablution room there?—As well as I recollect, there is. I believe there is an ablution room in every barrack in this district, in London.

3564. (*President.*) In the evidence that has been given before this Commission, Sir Richard Airey was asked these questions:—"Do you think that the repairs might be done more easily and more rapidly by hiring labour, than by employing engineers for the barracks and hospitals? On the spot? Yes, certainly.—What is the reason that everything the engineer seems to do is so dear?—I really do not know. There is a technicality that attends all engineers. I do not understand it.—Is what they do more lasting? Perhaps it is of a more permanent nature; it is taken more *en grand*, and there is a want of simplicity about it. I recollect an instance; I was sent with a strong force into the county of Leitrim. We were encamped, and

Colonel F. E.
Chapman, C.B.

8 June 1857.

it was likely we should remain there some time. I wrote to Sir Edward Blakeney, stating that the men had no means of cooking, and the weather was extremely wet. We were near the famous Ballynamuck, on a very swampy bit of ground, and I wanted very much to get some means of cooking independently of the common camp kitchens, which were deluged with rain; and I proposed to Sir Edward Blakeney that we should be allowed to construct a cooking apparatus with two boilers, in the usual barrack way. An engineer officer came down; there was an estimate and a specification, and then it had to be submitted to contract, and in about two or three months I should have had it done, at a cost of 90*l.*; but the end of it was, that I said it was of no use doing it; we should not be that length of time there, and it was given over. I got it done by a man from the town of

Mohill, and the cost was 17*l.*, and something less than 18*l.*—It could not have been the same article; it was a make-shift.

3565. That would apply where a thing is wanted for a temporary purpose; the engineers always construct too solidly, do they not?—I do not think so. If we know that the requirement is only of a temporary nature, we treat it accordingly. At Hounslow there were stables required for 100 additional horses, and we merely put up some little hut stabling and covered it with felt, and there they are now.

3566. (*Mr. Martin.*) But the disposition of the engineer officer, if left to himself, is to do the work well?—He is bound to do it well always. Whether you are making a small work, or a large one, the workmanship ought to be done well.

The witness withdrew.

Adjourned to Wednesday next at One o'clock.

Wednesday, 10th June 1857.

PRESENT :

The Right Hon. SIDNEY HERBERT, M.P.
Sir H. K. STORKS, K.C.B.
Dr. ANDREW SMITH.

Sir JAMES CLARK, Bart.
J. R. MARTIN, Esq., F.R.S.

President, the Right Honourable SIDNEY HERBERT, M.P.

Commissary-General GEORGE ADAMS, C.B., examined.

Commis.-Gen.
G. Adams,
C.B.

10 June 1857.

3567. (*Chairman.*) What office did you fill in the army in the Crimea?—I was senior deputy commissary-general in the Crimea up to the 22d of June 1855. I was afterwards with the Turkish contingent, and then I succeeded to the charge of the department in the East.

3568. Were you with the commissariat from the commencement?—Yes, in Bulgaria.

3569. The commissariat issues the rations to the hospitals as well as to the troops?—It does.

3570. Is that invariable?—Invariable. There may have been some articles of supply purchased down at Scutari by the purveyor, but I think, generally speaking, they are all supplied by the commissariat.

3571. You are now speaking of the practice in war?—Yes.

3572. At home does the commissariat supply the hospitals?—At home the commissariat is not generally employed.

3573. The commissariat are supplying the ration now?—Yes.

3574. Does that apply as well to hospitals as to the troops?—It may to regimental hospitals.

3575. Do you think not to general hospitals?—I think not. I do not think the practice is so now in the camp at Aldershott.

3576. (*Sir H. K. Storks.*) But in the colonies, how is it?—In the colonies the commissariat furnish everything.

3577. (*Chairman.*) Was there any distinction made in the late war, to your knowledge, with regard to the supply of the ration between general and regimental hospitals?—Not that I am aware of. I think they all obtained their supplies from the commissariat; they did with the army in Sicily, with which I was serving.

3578. There was a general hospital at Balaklava?—Yes.

3579. Was that supplied by the commissariat?—Yes; except such articles as were sent out to the purveyor from England.

3580. Did you supply it to the purveyor, the purveyor then accounting for it, or how was that?—No;

it was frequently issued to the surgeons at the hospitals, and these were afterwards taken up by the purveyor, who gave a general certificate for them, and paid for them according to the established practice.

3581. Therefore an account passed not only between the purveyor and the government at home, to whom he is accountable, as well as the commissariat officers, but an account between the purveyor and the commissary?—Yes, a nominal account; it was an account of the cost of the articles. The commissariat officer advanced the purveyor money to repay the amount of the articles purchased or issued from the commissariat magazines.

3582. Do you think that that is necessary?—Certainly not.

3583. You could dispense with that?—Yes.

3584. Do you think that the best way of simplifying the matter would be to make the purveyor's branch a portion of the commissariat?—I see no objection to that; it derives nearly everything from the commissariat abroad.

3585. Would it be an advantage over the present system that the purveyors should be commissaries, but a separate branch of the commissariat devoted to to the purveying service of the hospitals?—Yes, I think so; I see no objection to such an arrangement.

3586. Do you see any call for a change?—I think it would simplify many matters. For example, the purveyor attached to the Turkish contingent made out an estimate for a very large sum of money, 70,000*l.* for five months, which I was satisfied he could not require, but which I was called upon to provide. I could not get an explanation from him in time to correct his estimate, but if he had been attached to the commissariat he could have been immediately required to show upon what grounds he made his calculations.

3587. (*Sir H. K. Storks.*) You could not require him to furnish you with that information?—I could not; I must go to the General to get it, whereas if he had been under my orders, or attached to me, I could have readily obtained it.

3588. (*Dr. A. Smith.*) Would you propose that the commissaries should take the place of the purveyors, and that they should be liable to be removed from the duties of the hospitals?—No, I would keep them specially attached, and particularly to general hospitals.

3589. (*President.*) At the same time there would be this advantage, that they would cease to be so much under the control of the medical officer?—I think not; those attached to the general hospitals should be under the control of the medical officer.

3590. If the purveyors formed part of the commissariat, would there be the same facility in dismissing or removing a man that there is now?—Certainly.

3591. Would it not be necessary, in order to obtain the removal or dismissal of an officer, to apply to the commissary-general?—It would be necessary certainly. It is the rule of the service, that you cannot dismiss an officer without bringing him to a court-martial. You must go through certain established forms.

3592. Still the representation of the medical officer would be looked upon more as an accusation against a member of his department, and would he not be rather apt to try the case as between a man belonging to his department, and the head of another department?—No, I do not see that at all; I do not think that any officer would favour another who had not done his duty.

3593. Are you aware that in the Peninsular war, under the Duke of Wellington, the general hospitals were put entirely under the purveyors, and the purveyors for them became commissariat officers?—No; I was not in the Peninsula.

3594. In Sicily that was not done?—Not in my recollection. Where a general hospital is stationed you generally have a large dépôt, and an officer of high rank in the commissariat, and the duties are of great magnitude.

3595. I suppose you see some practical inconvenience in the purveyor at the base of operations performing the same duties that the commissary is doing in the front?—He would be specially attached to the hospital, and have nothing to do with the other extensive duties of the commissariat service; he could not possibly perform them.

3596. If a general hospital were supplied as to the rations by the purveyor, as the regimental hospitals are supplied by the commissariat, there would be two systems for one purpose?—Yes, but I do not see any necessity for that; the regimental hospital should be supplied from the same source as the general one. The regimental surgeon requires bread, meat, rice, and sugar, which are provided whether the men are in hospital or not. We look to the number of men constituting the army generally, and provide for the whole of that number.

3597. But you do not know how many of those men are efficient, and how many are in hospital?—No, we provide for the whole.

3598. The division upon the issue does not come under your cognizance?—Not necessarily.

3599. Can you put in a return, showing the manner in which the bread and meat are drawn?—Yes.

3600. The purveyor by his instructions can always purchase, if he chooses, meat at an enhanced price above your contract price, can he not?—Yes; we make a contract for him, and we generally pay a little more for the hospitals, because they require certain portions of meat which are selected for them; a regiment takes the whole beast.

3601. (*Mr. J. R. Martin.*) But the contracts are always made by the commissariat department?—Yes, for everything.

3602. (*Sir H. K. Storks.*) For instance, if you wanted a piece of timber?—Yes.

3603. (*President.*) Suppose the purveyor was dissatisfied with the quality of the meat given to him by the commissariat, he would go to the commissariat in order to make, through their machinery, a

contract for a better quality of meat at a higher price?—There is a contract made for the hospitals specially, generally speaking, but not in a place like Kertch, nor in Balaklava. You give the hospital the best you can. If there were any milch cows they would get them, or anything that arrived even without the application of the purveyor would be bought for the sick, if the medical officer was in communication with the commissary-general, which he always is.

3604. (*Sir H. K. Storks.*) In all contracts of that sort there are powers of rejection?—Certainly.

3605. It is always pointed out in the contract what the remedy is, and that the medical officer or the officer commanding the troops may purchase the meat?—Immediately.

3606. The purveyor would have the power, in that contract, to purchase at the cost and expense of the contractor?—Yes.

3607. (*President.*) Do you see any objection to sending out, for the supply of the troops, corned meat in lieu of salt meat?—It might be sent out to a certain extent, not to a very large extent. I should be afraid of corned meat if exposed unsheltered, which it might be, and its not keeping.

3608. How is it packed?—The boiled preserved meat was packed in 6lb. tins; it would be dangerous to depend entirely upon corned or preserved meat. You may have it as an additional supply; some preserved meat was sent to the West Indies, and they could not use it; and some to Hong Kong, and when it got there it was found unfit for use.

3609. Why? had it been badly prepared, or was it the effect of the weather?—I do not know whether it was badly prepared; probably it was. Some has lately been sent out to China with much more care and attention observed in its preparation.

3610. Is it necessary, for the use of the army, to salt meat as strongly as it is salted for the use of the navy, where it must keep four or five years at a station?—Yes.

3611. Why?—For the purpose of preserving it. It is more exposed with an army than on board ship.

3612. It may be more exposed to the chances of ill-usage; but it is not exposed, of necessity, to being kept so long a time?—They might possibly put less salt to it, to preserve it only for a certain period; but it would be running great risk.

3613. If you sent meat out for the army in the Crimea, for example, and it is ordered in England, corned or slightly salted, and it is sent out on a fortnight's voyage, and it is consumed within a month, why should that be corned to such an extent that you should be able to keep it for four or five years?—I should not use salt meat where I could get fresh; I might not be able to carry it if the army was on the march, and therefore it would remain in dépôt.

3614. Would it not be better to run the risk of some of the meat being spoiled, rather than that the men should be made ill by the constant use of strongly salted meat?—Much of the saltiness can be removed by steeping it in water.

3615. The navy can steep their meat in water with great ease, having coppers; but how can an army marching do it, where each man's portion is issued to him? how can he steep the meat?—He does not usually get salt meat on a march; they generally have cattle with them; to carry salt meat with them would require too much transport.

3616. As a matter of fact, in the Crimean campaign and in the two Burmese campaigns, the troops preferred living almost exclusively on salt meat?—And they did in Balaklava, because you could get no cattle; you could not keep them there, except what you imported. The salt meat sent out was very good indeed, and in Kertch the men had the facility, being near the sea, of soaking it; and boiled in salt water, it is much better than when boiled in fresh.

Commis.-Gen.
G. Adams,
C.B.

10 June 1857.

3617. Still you have not always the means of doing that?—No; nor are you always in a position like that before Sevastopol.

3618. Has not the sailor a very much more constant supply of anti-scorbutic food to balance the amount of salt meat given to him?—Yes, he has; he has everything to his hand.

3619. And peas?—Yes.

3620. And puddings made of flour and suet and raisins, and a constant issue of lime juice and preserved vegetables?—Yes; and such articles are not obtainable on a march.

3621. You say the salt meat is exposed to so much risk. Is it exposed to risks when it remains packed in casks?—Yes; if it cannot be placed under cover, it is much exposed.

3622. Do the casks yawn?—Yes; they are sometimes obliged to be piled so high, that those which are underneath get injured, and lose the pickle; you cannot be always moving them.

3623. (*Sir James Clark.*) You have just stated that the salt meat was better when boiled in sea water than in fresh?—Yes; the sailors always boil it in salt water. The meat improves by being boiled in salt water; it softens it a good deal.

3624. (*President.*) You say you have no confidence in the preserved meat?—I cannot say that I have no confidence in it; if properly prepared in a government establishment, and properly packed, I think you might then place greater dependance upon it, but I would not depend upon it entirely.

3625. But in order to secure the proper excellence of the supply you think it ought to be made under the eye of government, and not to trust to the supply of tradespeople?—Certainly.

3626. Would you do that as the biscuit is done down at Gosport?—Yes, and the coffee I would have ground, but not by contract. At Constantinople there was dirt of every description found in ground coffee supplied by contract.

3627. Would you ever buy coffee ready ground?—You are sometimes obliged to do so, but there is much difference of opinion about ground coffee. When I went to the Turkish contingent after what had occurred in the Crimea, I applied to the general to know whether he would have it ground or not for marching; and he said decidedly not, let the men roast and grind it, it preserves the aroma, and the coffee is much better.

3628. The Turks are accustomed to grind their coffee; but with our men it is not a question between buying ground coffee or in the berry, but whether you can issue it ground or not?—We tried to grind the coffee in Balaklava. Captain Heath of the navy undertook to grind some, and some roasting machines were made on board a man-of-war, and a party was put to grind the coffee; some was burnt and some not sufficiently roasted; if you want it ground you should grind and pack it in government establishments in England, and then it would be as good as it would probably be in the roasted bean. I have seen the French soldier roast coffee, and beating it in a piece of cloth with a stone taken off the road.

3629. (*Mr. J. R. Martin.*) Would it not be better to send out the coffee roasted; does it not preserve it better by being roasted in England, and being sent out?—I think not roasted only. The men would have a difficulty in grinding it.

3630. (*President.*) If you buy it ground, you have no security against adulteration?—None whatever.

3631. You are aware that you are not quite safe even in buying the berry?—I believe you are not.

3632. (*Sir James Clark.*) But a person of any skill could easily tell which were coffee berries?—Yes.

3633. (*President.*) Do you recollect what was supplied from the stores at Malta and Gibraltar?—Salt meat and biscuit.

3634. And salt meat of some standing, I suppose?—These articles are not now kept in dépôt to any extent, so that they shall remain over a long period.

3635. You do not think that the rations of salt meat which are kept in store in the different colonies are so large as to be any injury to the troops?—Certainly not, it is provided to such an extent only that it may be consumed by occasional issues before it is injured by keeping.

3636. Do you know how often it is used?—Sometimes twice or three times a week in the West Indies. I have known it supplied three times a week many years ago.

3637. Three times in that climate is unnecessary, is it not?—Yes, it is now, for you have greater facilities in procuring fresh meat.

3638. The issue of salt meat to the troops three times a week is deleterious to the troops, and, if possible, should be avoided?—Yes.

3639. Generally speaking now what is the amount of issue in the colonies?—Not more than once a week. In some it is not used.

3640. Do they issue split peas as the sailors have?—We used to do so, but in Balaklava the soldiers would not at first use the English split peas, they had thrown away their camp kettles, and found it difficult to boil them.

3641. Peas are not applicable as a part of the soldier's ration, as they require so long a time for cooking, is that your opinion?—They might be used in garrison.

3642. But not in the field?—No.

3643. If the stock of salt meat at the out stations is too large from a reduction of the troops, that in order to consume it before it decays a too frequent issue is made of it, could you not sell it?—I should think so; that depends upon local circumstances.

3644. As a matter of account would it be objectionable to make the commissariat the salesmen?—No, they are salesmen; they sell their own stores when it is necessary—there is no objection on that score.

3645. Is that ever done in the particular case of salt meat?—Yes. It was sold in the Crimea to vessels in want by officers of the department.

3646. Do you know the meat biscuit, the pemmican?—I have seen it.

3647. Is there any better security for that than there is for the preserved meat?—I should be afraid not.

3648. Upon what ground?—I do not think it would keep if it became exposed to the air.

3649. How is it packed? in tin cases?—I believe so, the air being excluded.

3650. Are you aware that the third of a pound is equal in nourishment to a pound of fresh meat?—I believe so.

3651. With regard to vegetables, have you not a great difficulty in issuing raw vegetables to the troops?—There is great difficulty sometimes in preserving them. In their shipment to the Crimea they had been sometimes exposed for 24 hours on the decks of boats; they had been put on board wet, and had become heated, and when we got them great quantities were obliged to be thrown away. The only vegetables that you can with any safety ship to an army are potatoes and onions.

3652. (*Sir James Clark.*) Are not potatoes very easily bruised?—Yes.

3653. (*President.*) But there would not be the fermentation that there is with cabbages?—No; instructions were given to send carrots without the tops; but you cannot in those countries get them to do what you want.

3654. (*Sir James Clark.*) Did you observe the quality of the preserved potatoes and other vegetables that were sent from France?—Yes; they were very good, and the concentrated vegetables were very good, but there is an opinion abroad now that they are not antiscorbutic.

3655. Would there not be more economy in sending out those preserved vegetables than common vegetables?—To a certain extent there would.

3656. (*President.*) There will always be a difficulty as to vegetables, as it is not always easy to detect their quality?—You can easily tell whether they are fresh; that is their recommendation, I suppose. Of course if they had been on board ship a long time, you could not always secure their being fresh.

3657. Do you know enough of the compressed vegetable to be able to say that they afford a safe substitute?—I think they do, they are very good indeed.

3658. Do they not decay, as the preserved meat does, in hot climates?—No; they appeared to be well dried and prepared; there were one or two instances where they were condemned at Balaklava; but M. Soyer found them of good quality. It was some whim of the parties; they thought from their appearance they were spoiled, and condemned them.

3659. You think that the difference between the security as to the preserved meat and the preserved vegetables depends entirely upon the original care with which the article was made and packed?—Yes; and the subsequent care that you can take of them.

3660. If the meat had been equally well prepared originally, and with equal care packed, it would be as secure, would it not?—The vegetables would, I think, keep better than the meat.

3661. (*Sir James Clark.*) On account of their dryness?—Yes.

3662. (*President.*) They are very cheap, are they not?—They are not very dear.

3663. I find in the appendix to the Crimean report it is stated that 1,000 rations cost 2*l.* 12*s.* 10*d.*, that is, six-tenths of a penny per ration, that is as cheap as raw vegetables, is it not?—Very nearly. The ration of preserved vegetables cost $\frac{1}{16}$ of a penny; the fresh $1\frac{1}{16}$ *d.* per lb. There is great loss on the fresh vegetables; and if you carry raw vegetables any distance, and they are exposed, they become unfit for use. The French were very glad to take on one occasion our condemned vegetables.

3664. Looking at the perishable nature of vegetables, and the liability to loss from fermentation upon the whole, you would say that compressed vegetables were as cheap as the raw vegetables?—I dare say they are, always recollecting the situation we were then in, and the distance we had to bring raw vegetables.

3665. Are they equally antiscorbutic?—That I cannot speak to.

3666. Have you heard they are not?—Yes; I have heard it said that are not. It has been suggested that the rice which they had mixed with them should be omitted, and aromatic herbs introduced instead, for you have always rice with you, and there is no occasion to increase the price of the preserved vegetable by adding it, as was originally the case.

3667. (*Sir James Clark.*) But not latterly?—I believe it was.

3668. (*President.*) Have you seen any instance of scurvy amongst the troops in consequence of using the compressed vegetables?—The scurvy had broken out before we had commenced the use of them.

3669. Did it diminish when the vegetables were freely issued?—I believe it did; but the medical officers can give a better idea of that than I can.

3670. The patentees maintain that all the antiscorbutic property remains?—I believe so. M. Soyer told me, when I met him a few days ago, that he had been in communication with the patentees, but whether the fact is so or not remains to be proved.

3671. As far as your experience goes, nothing has occurred under your observation which induces you to doubt their efficacy?—No.

3672. (*Sir James Clark.*) Your experience has not been sufficient to enable you to judge of the comparative merits of the two?—No.

3673. (*President.*) As far as your experience goes you are in favour of them?—Yes; but I would not

have them altogether. I would get fresh vegetables when procurable.

3674. The present practice with regard to the ration of the soldier is, that the commissariat supplies bread and meat at a fixed stoppage?—Yes.

3675. Then he is required by his commanding officer to spend an additional sum in messing?—Yes.

3676. What does he buy with it?—This, I believe, is liable to much variation in different corps, and even in the different companies of the same corps for additional bread, coffee, or tea, pepper, salt, vegetables, and sometimes milk; and the stoppage varies from $2\frac{1}{4}$ *d.* to $2\frac{1}{2}$ *d.* per man daily.

3677. I understand you to say that the stoppage varies in different regiments?—Yes.

3678. The nature of the articles purchased varies between companies for the same stoppage?—Yes; a certain stoppage is fixed for the men, and they spend that sum in any way the commanding officer may think proper.

3679. (*Sir H. K. Storks.*) No. 1 will get its potatoes cheaper than No. 2?—Yes, it may.

3680. The stoppage is the same?—That depends upon the commanding officer of the regiment; it will vary in different places; for instance, it may vary in London and at Portsmouth.

3681. Not the stoppage, but the price of the article?—I suppose that the stoppage is regulated by the prices of the articles to be purchased.

3682. (*President.*) As I understand there is a maximum stoppage which it is the general interest of commanding officers to see spent in messing?—Decidedly; he does not allow a man to have too much money to spend upon things that he does not require.

3683. At the commencement of the war this system still obtained in Bulgaria?—Yes.

3684. The stoppage was limited for the ration to $3\frac{1}{2}$ *d.*, and there was an additional stoppage of $2\frac{1}{2}$ *d.*, the men being intended to supply themselves?—Yes, until a board met and their breakfast was established, and coffee and sugar supplied by the commissariat.

3685. It was established because a certain supply in the market altogether failed?—Yes.

3686. You were obliged to have recourse then to an issue by the commissariat of the additional articles?—Yes.

3687. What objection do you see to make it the permanent system of the army that the commissariat should supply all that is necessary to keep a man in health, and give him three meals?—The bread I do not think is enough, they ought to have instead of a pound, a pound and a quarter. The meat is three quarters of a pound, and that is sufficient at home, but abroad it is not. It is said that in Canada you get as good meat as in England; so you do, but not all the year round—not during the six months in the year when it is dried up with frost, you do not.

3688. Do they not give a pound of meat abroad?—Yes; a pound of bread is too little, and a pound and a half is too much. When I was at the camp at Chobham, the troops could not use it—they wasted it.

3689. Would it be possible to issue from the commissariat for one gross stoppage of 6*d.*, and abroad 7*d.*, at once vegetables and everything that were necessary for a man's third meal?—I think it would; but the difficulty arises in fixing that stoppage. The late war in the east, and field service of the troops in Bulgaria and the Crimea, have, I believe, beyond doubt, established the necessity of such increased ration being provided for the soldier, equal to afford him

Breakfast,
Dinner and
Evening meal.

and the following ration was fixed:—

$1\frac{1}{2}$ lb. bread, or 1 lb. biscuit;
1 lb. fresh or salt meat;
 $\frac{1}{32}$ of a gallon of rum;
 $\frac{1}{2}$ lb. potatoes or green vegetables, or
 $\frac{1}{4}$ lb. of onions, leeks, or carrots;

Commis.-Gen.
G. Adams,
C.B.

10 June 1857.

Commis.-Gen.
G. Adams,
C.B.

10 June 1857.

Or $\frac{1}{4}$ lb. preserved or 1 oz. compressed vegetables;
1 oz. rice;
 $\frac{1}{2}$ oz. salt;
 $\frac{1}{2}$ drachm pepper;
1 oz. lime juice;
1 oz. ground coffee or cocoa,
or $\frac{1}{4}$ oz. tea;
2 oz. sugar.

The biscuit was increased to $1\frac{1}{4}$ lb. in the trenches; the fresh meat to $1\frac{1}{4}$ lb. for a short time; and an additional 1-64th of a gallon of rum was sanctioned in the trenches. Originally the ration of rum was 1-64th of a gallon.

The cocoa never appeared to be very palatable to the men; and the lime-juice was frequently undrawn.

The stoppages are at present as follows:—

In hospital	-	-	10d. at home.
"	-	-	9d. abroad.
"	-	-	8d. for boys.

In war $3\frac{1}{2}$ d.

Ration stoppage $4\frac{1}{2}$ d. at home on account of beer money.

$3\frac{1}{2}$ d. abroad.

Ration on board ship 5d., and 1d. additional for spirits, or tea and sugar.

The ration in Crimea	-	-	-	$3\frac{1}{2}$ d.
Coffee, &c.	-	-	-	1d.

$4\frac{1}{2}$ d.

So that the man in hospital benefited 1d.; but it appears to me that the stoppage might be made uniform, and a deduction of $4\frac{1}{2}$ d. made at home, on board ship, and abroad, by allowing the additional penny to be deducted for the stoppage abroad, to be added, as at home, to the soldier's pay.

The present stoppage at $1\frac{1}{2}$ d. (or $2\frac{1}{2}$ d. for the extra articles), from officers, excepting in the case of regimental officers, is most difficult of collection in the field.

In establishing an uniform rate of stoppage there will arise difficulties in regard to the issue of the ration of spirits and payment of the allowance for beer money, which require much consideration; as also when in hospital, the soldier is, I believe, subject to no deduction regimentally or otherwise.

3690. Could you raise the whole stoppage to 7d. at home and 6d. abroad, and then supply the soldier through the commissariat with that which he now gets for the ration messing for $2\frac{1}{2}$ d.?—I think it could be done; I sent yesterday for different articles; a pound of potatoes, a quarter of an ounce of tea, cocoa, and coffee, to give me an idea of the quantity and price. I have taken the London prices, and it appears to me that the extra articles would cost from $1\frac{1}{4}$ d. to 1d. and $\frac{6}{10}$ ths., and if the stoppage was made $2\frac{1}{2}$ d., I think it would fully cover their cost; it would one place with another; in some places it might be cheaper. In China you get tea much cheaper, and in the West Indies, coffee.

3691. With those prices you think it would be quite feasible, with the addition of $2\frac{1}{2}$ d., to supply the soldier with all those additional articles which he now gets with his messing money?—I think so, as far as I can now judge.

3692. If so would there not be this advantage, that you would then have a uniform practice both in peace and in war?—Yes.

3693. The present practice being inapplicable to war?—Yes, quite so.

3694. Would not there be a great diminution in the accounts, as there would be no variation of stoppages?—No, for the paymaster would deduct from every day's pay the 6d., or whatever may be fixed, whether in hospital, on board ship, or on shore.

3695. And the ration would be sufficient to keep him in health, without any addition out of his own resources?—I think so.

3696. Would there be any difficulty in issuing such a multiplicity of articles?—Not abroad.

3697. (Sir H. K. Storks.) It would require an enlarged commissariat staff, would it not?—No.

3698. (President.) At any rate, there would be a necessity for an increase of store room?—Nothing very great.

3799. How are the vegetables now kept which are purchased for the men?—They buy them in the market, and they use them day by day.

3700. Would not the supply at once be made by the commissariat in the same way?—Yes, certainly.

3701. They would come fresh to market and they would be used?—Yes, they would contract for them in England.

3702. (Sir H. K. Storks.) In case they detached, suppose a company or two, how would they be supplied?—You can always make arrangements to supply them.

3703. Arrangements can always be made to supply them?—I think so.

3704. (President.) In what way?—By making an arrangement with some person in the neighbourhood.

3705. A contractor would always, as part of his contract, undertake the business of issuing those things?—Yes, and to give to the companies certain quantities over which they would have a check.

3706. (Sir H. K. Storks.) You apprehend no commissariat difficulties of detail in supplying the soldier with his full ration under all circumstances?—I think not.

3707. (President.) In peace we have always done it?—Yes.

3708. Did you supply the men with vegetables?—No; but we could have done it without the least difficulty.

3709. Without any increase of staff?—Perhaps you might have wanted an assistant storekeeper to superintend, and to see that the issues were made regularly.

3710. On the other hand, with regard to accounts in consequence of the absence of the stoppage, would there not be a greater saving in clerks who keep the accounts of the stoppages than of additional expense incurred for the issuer?—The stoppage account is kept by the paymaster, and by the commissariat; at one time the money was paid over to us; latterly a system was adopted which obtained 40 years ago, by drawing only the net pay of the soldier, which is the best and proper way. There may be labour saved as to the hospitals and purveyors; it is a tedious process for them to recover, or to say what the stoppages are to be. If a man has been so many days in a hospital, the paymaster will account for the stoppage, and there will be no occasion to give any returns excepting for casualties.

3711. Was there not great confusion as to the stoppages in the Crimea?—Yes.

3712. Take the case of the army which first went to the Crimea. They left this country every man upon a stoppage of $4\frac{1}{2}$ d.; there was a stoppage of 6d. on board ship if he took tea or spirits, and a stoppage of 5d. if he took neither tea nor spirits; and when he landed there was a stoppage of $3\frac{1}{2}$ d., then an increase of stoppage to supply the breakfast to $4\frac{1}{2}$ d., and then he went into hospital, where it went back to $3\frac{1}{2}$ d.?—Yes, there is much vexatious trouble in those different rates.

3713. The soldier was at least dissatisfied, and a sort of equitable adjustment was made with him?—Yes; through the paymaster.

3714. Are you aware of the ration which is given in the Crimean report?—No; but it is the same, I believe, that I have given in, excepting that I have altered it to make it the personal ration of each man. I see they have two ounces of rice; it was for some time that quantity, but one ounce was the ration.

3715. Looking at that ration, do you agree with the statement made by the Commissioners, that for $2\frac{1}{2}$ d. in addition to the existing stoppage they could have made that addition to the ration?—For $2\frac{1}{2}$ d. and $4\frac{1}{2}$ d.

I think they could, but I will prepare an estimate of the cost of the extra articles. (*See App. XXIX.*)

3716. It is a complete ration they maintain for $2\frac{1}{2}d.$ in addition to the $3\frac{1}{2}d.$, supposing that the bread and meat can be given for $3\frac{1}{2}d.$?—I think they can.

3717. That would give three good meals to the soldier?—Yes; I see they have 24 ounces of bread, that is $1\frac{1}{2}lbs.$, but it is too much, $1\frac{1}{4}lbs.$ is quite enough.

3718. (*Mr. J. R. Martin.*) And 16 ounces of meat?—Yes, abroad; at home I think three-quarters of a pound quite sufficient.

3719. (*Sir H. K. Storks.*) But reckoning the bone it is not three-quarters of a pound of cooked meat?—I do not think that the men eat more than that at home.

3720. (*Dr. A. Smith.*) Do you think that any person who has an opportunity of getting what he wishes would be satisfied with three-quarters of a pound of meat?—I think he would.

3721. A growing soldier?—Yes, good meat, such as you get here, but I do not think it would suffice abroad.

3722. Perhaps three ounces are lost in the cooking?—Yes; sometimes.

3723. Would the remainder be sufficient?—Soldiers are not very great eaters; one man with another, I think it would, and they are generally in messes.

3724. (*Mr. J. R. Martin.*) Or where a soldier is liable to severe work or marching?—No.

3725. (*President.*) Do you think that an additional quarter of a pound abroad does not cover the inferior quality of the meat?—I think it is a fair equivalent.

3726. (*Dr. A. Smith.*) Do you think that the soldier would not be glad to have a little meat for his breakfast, besides dry bread and tea?—He might perhaps, but I do not know in a regiment what arrangements they make about the meals; I have seen the meat abroad sold by the cooks.

3727. (*Sir H. K. Storks.*) Does not that arise from the bad manner in which it is cooked?—No; I think that the cooks of regiments selling the fresh meat shows that the men did not get it.

3728. They were defrauded of it?—Yes; I think you will find at home three-quarters of a pound of meat is sufficient. I do not think they will eat more than three-quarters of a pound of meat.

3729. (*Mr. J. R. Martin.*) In that case a man has no supper?—But he is to get a supper. It is proposed that he should get a third meal.

3730. With three-quarters of a pound of meat he cannot have a supper with animal food in it?—No, I think three-quarters of a pound would be required for his dinner. I do not know that it is necessary for a man to have meat more than once a day.

3731. But nothing remains over for the following morning?—No.

3732. Is it not desirable that some meat should remain over for the supper, or for the breakfast, if the soldier prefers it?—I do not think that animal food is requisite more than once a day.

3733. (*President.*) Is not the soldier exposed sometimes to very severe labour, such as digging?—He is occasionally.

3734. And to very severe marching?—Yes.

3735. And walking sentry for 8 hours out of the 24?—Yes.

3736. (*Mr. J. R. Martin.*) Are you aware that in the European regiments in the East Indies, in a climate where so much animal food is not required as in a temperate climate, the ration of animal food is still sufficiently liberal to allow the soldier to have something remaining over for his supper, and that it is found to be conducive to their health to have supper?—I was not aware of that. I thought that in the Indian army it was one pound of fresh or salt meat.

3737. I speak particularly of European regiments in the East India Company's army?—I can give you information from a paper I hold that, in Hong Kong, they then only had one pound of fresh or salt meat.

3738. (*President.*) Are you aware that in the navy the meat ration is 16 ounces of fresh meat, or 12 ounces of salt?—Yes; less of salt than of fresh, but they make it up with something else. When they give them salt meat, they make it up with peas.

3739. Pudding, peas, cocoa, cheese, and all those things besides?—Yes.

3740. I will read you a Yorkshire farm labourer's diet,—bread, rough weight in ounces, 40 ounces; beef, 18 ounces; bacon, 7 ounces; vegetables, 4 ounces; beer, 60?—That must be during harvest time.

3741. You stated before that you would not supplement the salt meat ration by peas for the army in the front, on account of the difficulty of cooking it?—I would give peas, or haricot beans, or yams, or potatoes, or bananas as vegetables.

3742. Have you drawn up any rations as substitutes for the home ration for different climates?—I have put down the different climates where articles of local produce can be substituted.

3743. Will you just read them?—The ration established in the Crimea might probably admit of the following alteration;—At home, where fresh meat can generally be obtained of a much superior quality, it should remain, as at present, three-quarters of a pound, and at home and abroad the ration of bread should be fixed at $1\frac{1}{4}lb.$; and the other articles might be the same, excepting lime-juice, which should only be issued when deemed advisable by the senior medical officer. Such local modifications or substitutions of one article for another might be sanctioned should it be deemed advisable.—In the West Indies, yams, the sweet potato, and the banana, instead of potatoes.

3744. (*Sir H. K. Storks.*) Spirits never form a ration by right?—Not by right, that has been the case ever since I have been in the service.

3745. (*President.*) Except on board ship?—Yes. I believe that is an exception; they may have rum, or tea, or sugar by paying the extra *1d.*

3746. With regard to those alternative rations which you propose for different climates, would the change augment the cost, or would they be all within the sum you have mentioned?—I do not think there would be any great difference; I think the cost of the ration would be about the same. If you substituted the banana for the potato, or the sweet potato for potatoes, it would be less.

3747. Would you put cheese into the ration?—No, the soldiers would not take cheese in the Crimea. It may have been that it was foreign cheese, it was condemned and thrown into the sea at Balaklava.

3748. The common English cheese would be the best for their consumption, would it not?—Yes.

3749. And that I suppose they would like, as it is the habitual food of the class from which they came?—But what would you give it instead of? I think that already the articles proposed are sufficient.

3750. Is not cheese one of the articles enumerated in the Crimean report?—No; cheese is not in it.

3751. (*Dr. A. Smith.*) Did they not refuse the cheese in consequence of its being made an extra charge, provided they took it?—No; it was given gratuitously, but they would seldom take it.

3752. (*Mr. J. R. Martin.*) Was it not foreign cheese, and indifferent in quality?—It was; some of it was Parmesan cheese.

3753. (*President.*) The poorest kind of cheese keeps the longest, does it not?—Yes; but it becomes hard and unpalatable if kept long.

3754. And it contains more of the nitrogenous quality?—I do not know.

3755. (*Dr. A. Smith.*) Are you satisfied that it was issued without any additional cost?—I am.

3756. Did the soldiers object to accept the preserved potatoes?—They did at one time.

3757. Was not that in consequence of their being made to pay additional money?—No; even when they got them as free rations the men did not at first like the preserved potatoes.

Commis.-Gen.
G. Adams,
C.B.

10 June 1857.

Commis.-Gen.
G. Adams,
C.B.

10 June 1857.

3758. (*President.*) In the same way they objected to the cocoa?—Yes, they did not like it.

3759. (*Sir H. K. Storks.*) They would like tea better than coffee?—No; I think coffee they like the best, and I think coffee is the best for the soldier.

3760. (*President.*) The navy cocoa was tried in Bulgaria, was it not?—Yes, I think we had some, but the men did not like it. They used to roast the coffee in the lid of the camp kettle, which was then a very different one to what they have now. When they tried it in the late war it would not stand the fire.

3761. (*Sir J. Clark.*) Do you make a difference in the diet of the soldier according to the climate he is serving in, between the West Indies, for instance, and Canada?—Scarcely any.

3762. (*President.*) But by your improved ration you would?—There would be local modifications or substitutions of one article for another, which might be sanctioned should it be deemed advisable.

3763. (*Sir J. Clark.*) Would you not increase the food in a northern climate?—No, I think not; I think that the animal food is quite enough.

3764. (*President.*) Do you not increase it in Canada?—No, we only give them a pound; I do not think a man can eat more than a pound.

3765. (*Sir J. Clark.*) Did you make any difference in the diet of the Turkish contingent?—Very great. (*Vide Appendix XXV.*)

3766. (*Mr. J. R. Martin.*) What was the difference?—The ration of mutton was 9 oz., of beef 13½ oz.

3767. (*Sir J. Clark.*) Did you mark what effect that had upon the health of the men?—I never saw a finer division of foreign troops than the division of the Turkish contingent commanded by General Cunynghame, who took great pride in them.

3768. They thrived upon the diet that you gave them?—Yes; they got the full diet sanctioned.

3769. (*Mr. J. R. Martin.*) Should you not consider that the ration, such as you describe it, was still above the average of their ordinary diet in their own country?—I should, because they got their full ration with us, which they did not get under their own pashas.

3770. In fact they were better fed by you than they had been by any of their former rulers?—Yes; and the men said so.

3771. (*President.*) Did they improve in appearance?—Yes, very much.

3772. (*Mr. J. R. Martin.*) How came the office of purveyor to be established in the British army? Did the office precede the formation of the commissariat department?—No; it followed it in the Peninsula, to the best of my recollection.

3773. Could not the commissariat department supply to the hospitals all the articles which are now supplied by both the purveyor and the commissary?—Yes.

3774. When troops are on the march or with the enemy in front, do the hospitals in either case continue to receive the best of the meat as you have stated they did in Kertch?—I cannot say that they received the best of the meat; I believe it to have been as good as could be obtained.

3775. It has been stated that in India, where the commissariat department supplies everything both for the hospitals and the troops in front, when the troops are in active movement those in front are well served, and the hospitals must take what they can get. Have you seen any such differences in the supply of the hospitals?—Certainly not.

3776. (*President.*) Take this case, suppose a large hospital at the base of operations and a large quantity of cattle was collected for the use of the army, would not the commissariat officer be disposed to send the best beasts forward to the army as being those that would stand the journey the best?—He would probably send forward the most lively, not always the fattest, as they could not perform the journey so well.

There are men entrusted with such duty, and they make arrangements for its proper performance.

3777. In the selection, as a matter of necessity, the best animal would go first?—I do not think so; if the medical officer expressed a wish that good meat should be retained for the hospitals, I do not think there would be any difficulty made to comply with it.

3778. (*Sir H. K. Storks.*) You send forward the best marcher, do you not?—Yes.

3779. And kill the weakly animals?—Yes.

3780. (*Mr. J. R. Martin.*) Would you recommend the abolition of the office of purveyor, and the substitution of a special commissariat officer for the service of hospitals, general and regimental?—It appears to me that it might tend to economy if the purveyor's department was made a branch of the commissariat, and rendered their accounts to the senior commissariat officer. As both are now under the authority of the war department, instructions could be prepared to carry out such a measure which would greatly simplify and facilitate the present mode of transacting business. All purchases for the army abroad are now made by the commissariat, and were competitors to appear in the same market, prices could not fail to be enhanced to the detriment of the public.

3781. I apprehend that you do not recommend the absorption of the purveyor's function by the commissariat?—No; I would leave the purveyor still to perform his functions with the general hospitals. He now receives from the commissariat any articles which he may require by requisition. The principal articles are provided by a general contract for the army—for the whole number of the army; the purveyor may have milch cows if he wants them for the hospital; he attends to a great many duties that probably in a general hospital should not devolve upon the commissariat officer.

3782. Why not?—I think it is a peculiar duty that the purveyor has to perform; and therefore I would not take away an officer who was accustomed to a general hospital, but I would leave him in the charge. He knows the rules and regulations of this special service; but as for his keeping separate accounts, and receiving separate means, I think it unnecessary.

3783. (*Dr. A. Smith.*) Under whose control would he be in a general hospital?—He may be under the control of the medical officer, or that of the commandant.

3784. Just the same as the purveyor is at present?—Yes; but his accountability should be under the commissariat.

3785. (*Mr. J. R. Martin.*) By that arrangement he would be under the daily orders of one officer, and he would be held responsible to another officer of another department?—It would be only the same as his responsibility to the War Department as regards his accounts.

3786. (*President.*) The only change that you contemplate, is a change with regard to the accounts?—Yes; there are situations where you have purveyors where you do not want them; but where there are general hospitals it is necessary to employ a purveyor; but there are purveyors who have scarcely any duties to perform, such as in Jersey.

3787. (*Mr. J. R. Martin.*) In the Crimea there was a great deal of clashing and confusion of the duties between the purveyor and the commissariat department, one making a contract and another paying for it; one having to see to the washing, and another to attend to other articles of supply?—I think not.

3788. (*Sir H. K. Storks.*) Even now the purveyor must make an application to the commissariat when he wants a contract entered into for anything?—Yes; but there are not many articles that you cannot supply him with at once—such as bread, flour, biscuit, rice, sugar, and coffee.

3789. Suppose there was a want of oranges, would he apply to the commissariat?—No, except when he cannot get them on the spot himself.

3790. (*President.*) The practice is that the purveyor goes to the commissariat only for things which the commissariat habitually supplies, such as bread and meat?—He goes to him for everything when he cannot meet with it in the market himself; for example, at Kertch, he could not get oranges, and he came to me, and there happened to be a vessel with some on board, and I purchased them for him.

3791. But medical comforts, such as arrowroot and sago, they habitually procure for themselves without reference to the commissariat?—No; there is a commissariat contract made for those articles.

3792. (*Mr. J. R. Martin.*) He is the receiver of what the commissariat dispenses to him?—Yes; and he is with the medical officer the judge whether they are of sufficient good quality; if not, he has the power of rejecting them.

3793. The only change that you recommend is, that he should account to the commissary-general, instead of, as he does now, to the chief authorities at home?—Yes; and that there should be a purveyor attached to a general hospital whom it should not be in the power of the commissary-general to withdraw, except with the concurrence of the medical officer, supposing that he did not render his accounts satisfactorily.

3794. Do not you admit that putting him under the commissary-general is giving him two masters, and that he would not serve the medical officer so implicitly as he would otherwise do?—No, I think not. It is now merely a nominal affair; a requisition is made, and the articles are bought and paid for by the commissariat, and settled for afterwards; the purveyor signs a receipt, and then he has to take all those receipts back and get the money from you and pay it back again; it is only a paper transaction.

3795. That might be dispensed with without constituting the purveyor part of the commissariat?—It might.

3796. If you do that will he not look to the officer outside of the hospital as the source of his promotion and advancements, and as the person who could dismiss or remove him if he misbehaved himself?—He could be no more dismissed by the commissary-general than he could be by the commandant of the garrison, unless he committed a fault punishable by the articles of war.

3797. (*Sir H. K. Storks.*) But the commanding officer would be the superior officer of his department, and he would have two masters instead of one?—I do not see any particular necessity for their being attached to the commissariat, but let them render their accounts to the commissariat.

3798. (*President.*) You think that the rendering the accounts to the commissariat would cover all the objections to the existing system?—It would tend to simplify the service. Where there are no general

hospitals on a large scale, it appears to me there is no occasion for a purveyor.

3799. (*Mr. J. R. Martin.*) Have you not stated that the regimental hospitals are supplied by the commissariat, and the general hospitals by the purveyors?—The regimental hospitals are supplied in the same way as the others—they get all articles by contracts entered into by the commissariat. There is no purveyor attached to a regimental hospital.

3800. (*President.*) Why is one place unsuitable for a purveyor? If a garrison be a very small one it will require either a commissariat officer or a purveyor?—You are generally obliged in small garrisons to have a commissariat officer, and that commissariat officer performs the duties of the purveyor.

3801. (*Dr. A. Smith.*) Is there a commissariat officer now in the Channel Islands?—No.

3802. (*Mr. J. R. Martin.*) Is the commissariat kept on the same footing during peace as in war in this country?—It is not. On the moment of emergency we are sent off anywhere and everywhere; but that over its officers are dispersed over the colonies or placed on half-pay.

3803. In peace should the commissariat be kept upon a footing sufficient for its easy increase on a declaration of war?—Most decidedly. You lose more in one year, at the outbreak of a war, than would keep up a proper establishment for twenty.

3804. Are you aware that in the Indian army there has never been such a functionary as a purveyor, and that all the hospitals are furnished by the commissariat department?—I was not aware of that.

3805. Can you furnish the commission with the French ration as well as the English?—I beg to hand it in. (*See Appendix No. XXV.*)

3806. (*Dr. A. Smith.*) From your experience in the service are you of opinion that it is a good plan to issue a spirit ration to the soldier regularly?—I think it is; it is always resorted to on active service.

3807. (*Sir H. K. Storks.*) Do you think that the efficiency of the soldier is improved by it?—Yes; I think it is better to provide it for him of good quality than that he should spend his money in the canteen for bad spirits.

3808. (*Mr. J. R. Martin.*) Should it be served as a regular ration to a young recruit?—I do not think the small quantity given to a soldier would do him any harm.

3809. (*Dr. A. Smith.*) Would it not be better to substitute beer for spirits?—You cannot abroad.

3810. But suppose you could substitute ale for the spirit ration, would it not be more desirable?—I am not prepared to say that it would not be in a country like this, where you can get good ale and beer, but abroad you cannot get it.

Dr. JOHN CONOLLY examined.

3811. (*President.*) You have had great experience in the treatment of lunatics?—Yes.

3812. You are acquainted, are you not, with the hospital at Haslar?—Yes, I am.

3813. That hospital was, I believe, put upon an improved system by a gentleman connected with yourself?—Dr. Anderson was a friend of mine, and had frequently visited Hanwell.

3814. Have you frequently visited Haslar since his appointment there?—Not frequently. I have been there twice since; once before he went, and twice since.

3815. Have you any knowledge of the proportion of cures to admissions at Haslar as compared with other asylums?—No.

3816. So far as you are acquainted with it, you believe it to be, for its purposes, very successful?—Particularly so for the class for whom it was intended, as to their comfort and general health. (*See Appendix No. XLV.*)

3817. Is there anything arising out of the peculiarities of the class of men who are treated there which renders the treatment different from that which would be adopted in the cases of ordinary lunatics?—Yes; it appeared to me that they were much more favourably placed there than they would have been if put into any ordinary asylum, as they have around them those objects in which they take an almost exclusive interest; and they have many amusements connected with their former profession, and yet not entailing the least anxiety upon them, but doing them good, and the good done sometimes was very marked indeed.

3818. They are sent out boating, are they not?—Yes; on one occasion a man who had not spoken for a great many years spoke for the first time within the hearing of many when he caught some fish when boating and was counting them, and from that time he began to recover.

Commis.-Gen.
G. Adams,
C.B.

10 June 1857.

Dr. J. Conolly.

Dr. J. Conolly.

10 June 1857.

3819. In that particular case the proximity to the sea and the sight of shipping was you think, a very great advantage?—It seemed a very great advantage. The first time I visited the hospital, although they were so near the sea, there was a high wall between the sea and them, and many things were done to make them very uncomfortable. Restraint was used to a considerable extent, but afterwards, when Dr. Anderson introduced his change of system, the walls were lowered, and in some places mounds were raised, and the appearance of a great number of the patients was wonderfully satisfactory,—they seemed pleased and cheerful. One patient, Patrick Walsh, who had been in restraint and always handcuffed, and who they thought could not be liberated, was, when I saw him the second time, without handcuffs, and he employed himself in making little balls for children to play with; and all restraint was entirely abolished from the asylum.

3820. (*Sir James Clark.*) Is it your opinion that that case would be more likely to be cured in that asylum, than if he were sent to a county asylum?—I am inclined to think that he would.

3821. (*President.*) The profession of a sailor is a very peculiar one; would you make the same remark as to a soldier?—I do not think that the peculiar resources are quite so many, but there are certainly some. But before giving any precise opinion about the soldier, I must observe that I do not quite understand whether the intention is to provide for him an asylum in case of an occasional attack of insanity—a first attack—and then, if he gets well, to restore him to the service, or whether he is to be kept there when incurable, as it makes a great difference in the question altogether.

3822. The practice being not to send a man back to the ranks, it having been found inexpedient to do so, would you consider that a separate lunatic asylum is necessary to keep either the incurables or persons who, upon cure, would be sent to their friends in civil life?—No; it seems to take away in a great measure the necessity for any special provision for them of that kind, excepting the necessity which arises from the difficulty of putting them in county asylums, which, it appears, is great, as their parishes cannot always be made out. And certainly other asylums, where patients are received for small payments, cannot generally speaking be recommended. There may be one or two exceptions, but generally they are to be entirely condemned.

3823. The practice in the army as to lunatics is this—they come to Chatham to be under observation, and are then discharged from the service; and if their friends can be traced, they are sent back to their parishes, from which they would go to the county asylums, which are good?—Yes.

3824. But the only lunatics as to whom there could be any question of the government permanently treating, would be those whose birth or whose parish cannot be traced. I believe they are generally about 80 in number. Would you for that number think it advisable to construct a separate military lunatic asylum, or would you trust to their being sent out to private asylums?—I think that for so small a number one would scarcely recommend the great expense of a separate establishment. Besides which I think so small a number would not be so advantageously treated as they would be if they were scattered; because where there were more patients, where you have a great number, you commonly have a more efficient man at the head of the institution. It is not worth while for a man to take the charge of about 70 or 80 people in a public institution. I think that you would hardly find men anxious to take it.

3825. (*Dr. Andrew Smith.*) We must assume that the government would take care that an efficient man would be at the head of the establishment, which contained 80 patients?—I have no doubt that they would. The great difficulty, that you would have in that case, would be with respect to finding medical men willing to devote themselves to so small an asylum. Assuredly they ought to be prepared for undertaking

such a charge by a considerable and intimate acquaintance with what is done in the best conducted county asylums.

3826. (*President.*) Would you say that a man of fair average ability, or taking two men of equal ability, would either of them, with the necessary study, be equally well adapted to manage a lunatic asylum, or does it require some peculiarities in character?—I think that it requires adaptation of character, a peculiarity in character. He must not be merely a man who looks at a patient in a military point of view. He ought, secondly, to have experience, which might be gained in six months easily enough, as to what is done in an asylum, and the general mode of managing people in the various moods of mind and temper.

3827. Supposing that men have equal opportunities of study and experience, is it not true that there are some who have a special turn for the management of lunatics, and of that quality you cannot ascertain the existence beforehand?—It is often difficult to do so.

3828. The probability is, that if an army surgeon were selected for general intelligence, and sent to study in some lunatic asylum, it might be that we had not got the very best man for the purpose, though he used every opportunity to study?—There might be some difficulty, no doubt, in that; but generally speaking, I think you would require very little more than that a man should have intelligence, good sense, and a kind indulgence for all his fellow-creatures. It is nothing but the exercise of kindness and forbearance towards people who are insane; and sometimes it rather casts a satire upon what is done out of an asylum, to know that there is more of that kind of charity exercised in regard to lunatics than there is among sane people. I should think that the difficulty is rather in the habits of medical military men than in the want of men of good disposition.

3829. Do you think that their habit is too much that of command?—Yes; and too much the habit of suspecting that in every case there is deception.

3830. When you say that so small a number as 80 is not so good, do you mean that in private asylums you would not find so eminent a man at the head of a small one as of a large one; or do you think that a small asylum has not the same advantages for the classification of patients as a large one?—I think that a man having charge of anything like a public establishment, with only that number of patients, has not his mind strictly kept up to the point of tension and interest which it ought to be. Though large asylums are in many respects objectionable, they have a very great advantage in that respect. In a large asylum, a man's chief interest is his asylum, and he has no time for anything else. There is also more life and variety.

3831. What are the disadvantages of large asylums?—When they are carried to too great an extent, such as they project at Hanwell, the health of the patients is really deteriorated by so many being crowded together within a given space; and also the arrangements of the asylum are such, that there is great fear many of the wards may be neglected. The wards on the third storey are, I think, invariably in some degree neglected.

3832. Why so?—I think partly from the extreme physical fatigue attending going constantly into them, and partly because patients sometimes are put there and forgotten. They are out of sight, and there is a difficulty in conveying provisions and other things required to them, and in getting the patients comfortably up and down stairs.

3833. When you speak of a large asylum, and a small one, what are the present numbers at Hanwell?—About 1,100.

3834. You do not think that too large, do you?—Yes, I do; I think that hospitals for 500 would be about the best, if they could be limited to that.

3835. It is contemplated, is it not, to increase Hanwell beyond that?—It is meant to enlarge it for 600

more; and, according to the plan, in the report that I have laid before you, they put another story upon every part of the building that will support it. Already there are now two stories, and a basement in some of those parts of the building, so that there will be four stories.

3836. You think the third story objectionable?—Yes; a man walks through the lower wards and comes back through the upper, but if he has to retrace his steps, and go up again, I know that he will often be glad of any excuse for not going that day, the physical fatigue and exhaustion being so great.

3837. (*Sir James Clark.*) You think that no lunatic asylum should be more than two stories high?—Yes.

3838. (*Mr. Martin.*) By the increase that you speak of ventilation will be more difficult?—Yes; that is a point about which the committees of asylums seem to know but little. They speak of the advantages of large dormitories, but in walking about at night through the wards of Hanwell, when I have come to the staircases leading to the large dormitories I have been struck down almost with sickness.

3839. Though that was the ventilating trunk?—Yes; and the patients had only been in bed for two or three hours perhaps.

3840. (*President.*) You require a larger amount of space in proportion for a lunatic than for a healthy man?—I think that that should be the general rule, particularly in those parts of the asylum where they are employed. If they run against one another they are irritated, and the object is to keep all quiet.

3841. Is not the emission from the lungs and skin of an insane person more deleterious than from a sound body?—Sometimes it is especially so, and it is remarkable that it will disappear and appear according to the patient's mental condition; so that you may foretell in some cases that a paroxysm is coming on, by the peculiar odour from the skin; not only in the poor, but in persons most scrupulously cleanly, ladies and gentlemen of the most delicate character.

3842. (*Sir James Clark.*) So that a lunatic asylum would require more careful ventilation than a hospital?—Yes.

3843. (*President.*) In other respects would the building for a lunatic asylum be different in construction to that for an ordinary hospital?—Yes; I think that there should be a difference throughout. I think that the general simple plan of an asylum does not seem required in a hospital, namely, that of having long corridors with rooms opening out of them; that seems to be the best plan for an asylum, but in a hospital I imagine that would lead to a waste of room.

3844. But a hospital so constructed would be available for the purposes of a lunatic asylum?—Perfectly so.

3845. The corridor you attach very great importance to?—Yes; the patients cannot all be trusted to go in and out, but they can generally be in the galleries.

3846. If the government had a building constructed upon that principle, available for lunatics, you would say as to such a building, that you could not well have anything much better?—No; I think generally it would be very good.

3847. (*Sir James Clark.*) You require special exercising places for lunatics, do you not?—There should be an abundance of ground round the building. There has been one great error at Hanwell; though increasing the numbers continually, they have no more land now than they had ten years since.

3848. (*President.*) Is there any truth in the supposition that, for the treatment of lunatic soldiers, it is an advantage to have them together, as you can carry on the species of discipline to which they have been accustomed?—With regard to soldiers, I presume you have young men from 20 to 40, and they are very liable to derangement. At that period of life attacks of acute insanity are more common than earlier or later. At the same time they are much more curable; and I have thought that if the object was to cure the soldier, and to return him to his duties, it would be

well to keep up soldierly habits and parades. Serjeants, non-commissioned officers, make the best of all attendants upon lunatics. They would have been in charge, and by keeping up the order observed in the military service, the man would return as a matter of course and perform his duties with greater facility, I think, than if he were put into a civil hospital and then taken back into the regiment.

3849. That would be rather with a view to his future career as a soldier?—Entirely.

3850. Is it not the fact, that the great majority of cases of lunacy in soldiers arise from drink?—Yes, I believe so.

3851. In those cases is there any advantage, do you think, in having them together?—Those cases generally recover very soon; the greater number do. A young man, if kept sober, begins to recover his mind in a few weeks, and in two or three months he is well, and you cannot keep him in any asylum; if the man could be persuaded to remain sober, I believe he might be a very efficient soldier.

3852. Have you many of those cases at Hanwell?—Yes, a great number, especially among the poorer Irish in London. Many of them have been admitted into Hanwell several times. They go out quite well, and they come back again insane.

3853. They cannot resist the temptation?—No; and yet they get so well that we cannot keep them there.

3854. (*Mr. Martin.*) Those are cases in which an acute attack is complicated with delirium tremens?—Very often.

3855. (*Sir James Clark.*) Setting aside the future of the soldier, is he more likely to recover in a military asylum or in a county asylum mixed with civilians?—I think that a recent and acute case might have as good a chance of recovery or better in a military asylum, having the advantages of military order and precision, supposing also the superintendent of the asylum to be possessed of all the requisites for the proper management of lunatics; at the same time, it would be easy in a military asylum to adopt everything that is done in other asylums, if the superintendent were so disposed. (*See Appendix XLV. and XLVI.*)

3856. (*Sir H. K. Storks.*) You find military attendants the best?—Always. The best attendants that I ever had at Hanwell were old serjeants or discharged soldiers. They both commanded and obeyed well; they took great care and enforced obedience where it was necessary, and they attended strictly to the orders of those above them. I think that the sound of the bugle, or a drum and a little parade got up every morning would help to keep an insane soldier all right.

3857. (*President.*) So that there would be that advantage, that you could with soldiers treated separately in a military asylum superadd the advantages of military discipline to the curative processes which are employed in civil establishments?—Yes.

3858. Is there any truth in this, that it is a disadvantage to keep lunatics exclusively of one class together?—Generally speaking we should not do that in civil life, and we remove a man as much as possible from all his former occupations; but that I do not think would apply to a private soldier. I beg to say that I do not think the officer of the army would be benefited by being taken to a military asylum. There are so many very good asylums—the Warneford asylum at Oxford, the Coton Hill asylum near Stafford, and several houses in which patients are received for moderate rates of payment, and have every possible advantage.

3859. (*Mr. J. R. Martin.*) The difference in the treatment of the two would arise, would it not, from the superior education of the one as compared to the other?—Yes, I think so.

3860. (*President.*) But with lunatics or professional men, whose lunacy arises from over-work of the brain, your object is to break all associations with their past life?—Yes.

Dr. J. Conolly.

10 June 1857

Dr. J. Conolly.

10 June 1857.

3861. Do you think that that does not equally apply to the private soldier?—No, his work does not occupy his brain much; it is a mere matter of habit.

3862. You state that upon balancing all the advantages and disadvantages, you would prefer to see the soldier in a military lunatic asylum, but not the officers?—Yes; but I should limit that to recent cases, because if a man had a second attack you could not trust him any more as a soldier in any climate; but I cannot help thinking that there are many cases of recent occurrence where a man may never have another attack.

3863. (*Mr. Martin.*) In the instances where the cases were deemed to be incurable, should you then give the preference to civil institutions for common soldiers?—Then I think it becomes more a matter of financial consideration than any other. I think he would benefit probably more in a county lunatic asylum; he would be occupied in something, in gardening or farming.

3864. (*Sir James Clark.*) In the curable stages you would prefer a military asylum?—Yes, I think it might be desirable.

3865. (*President.*) You would prefer that a soldier who has a chance of being cured should be treated in a military lunatic hospital, but you see no advantage in keeping an incurable military lunatic in a military asylum?—Exactly so.

3866. There being some difficulty in always keeping a government establishment up to the mark, they not having the advantages which private asylums have of constant competition between themselves, do not you think that that ought to be an element to be considered in deciding upon the question?—I suppose there is an unwillingness to let the commissioners of lunacy exercise their usual functions in the military asylums.

3867. Have you seen a printed paper giving the report of Messrs. Gaskell and Milton upon the state of the lunatic asylum at Yarmouth?—Yes. There the establishment was altogether very much inferior to what the wants of the service required. Very much indeed. But it appeared to me that the commissioners there made a very excellent report; and I must say that, making allowance for all men having such duties to perform, they do seem to keep the asylums as much as they can up to the proper point. I only wish that the Middlesex magistrates as to Hanwell had paid a little more attention to their wishes and representations. I believe the views of the commissioners generally to be exceedingly enlightened and liberal, and I cannot help thinking that their visits would be very useful.

3868. Supposing, therefore, that the government authorities made no objection to the visits of the lunacy commissioners, do you think that that would be in itself sufficient to keep them up to the mark of private establishments?—Yes. I really think it would be very important, because there are no people who are so intimately acquainted with the best asylums as the commissioners are: their attention is constantly given to them.

3869. You stated just now that the private establishments are sometimes not trustworthy?—I mean where they profess to take patients for very low sums of money.

3870. They are equally under the visitation of the Lunacy Commissioners, are they not?—They are; but the Commissioners have sometimes over and over again to suggest improvements which are not followed. Some of the borough asylums have been very bad in that respect. The only one almost, among such private establishments, that they speak very well of is that at Bow.

3871. To which the soldiers are now sent?—Yes.

3872. Therefore the inspection of the Lunacy Commissioners is not in itself sufficient to secure efficiency?

—No; perhaps there might be in a military asylum some power to enforce what was recommended by them.

3873. When you state that those asylums are not trustworthy where they charge low rates, the rates charged in those places are not lower than the cost at Hanwell?—No; but the difference of the treatment in every respect is almost incredible; and in looking through the reports of the Commissioners you will sometimes find that year after year they have pointed out in different parts of the country objectionable things that have been taking place which have been very slowly amended. Of course, upon the whole, they have done great good, and I trust there are now scarcely any asylums in England so bad as formerly.

3874. (*Mr. J. R. Martin.*) Have those difficulties arisen with the municipal authorities, or with whom?—Yes; I know the borough asylum near Hull. It is a miserable place, and in every respect unfit for lunatics, and the Commissioners have been for half a dozen years endeavouring to get it improved.

3875. There again the municipal authorities have been the parties at fault?—Yes.

3876. (*Sir James Clark.*) Do you not think that we have too few Commissioners, and that they cannot visit as often as they ought?—I believe that is the case, that they are really overdone with work; they often appear to be obliged to put off visits.

3877. (*President.*) Can you state the cost of each patient at Hanwell?—I think about 24*l.* a year; that includes subsistence, dress, furnishing, salaries, medicines, and everything.

3878. (*President.*) Everything, except the original cost of the building?—Yes.

3879. Does it include the annual repairs?—I think not. In the report there are very ample details of everything given as to the cost of each person.

3880. Have you any objection to state whether the selection by the government of Coton Hill for officers and of Bow for privates is a judicious one?—So far as I know the arrangements appear to be good at Bow. I must say that although I have wished to visit it, I have not seen it. But as to Coton Hill, I can speak positively, and as to the little asylum at Cheadle, and the one near Oxford, the Warneford asylum, and the Northampton asylum under Dr. Nesbitt. All these I can speak to most positively as being well conducted. The asylum at Northampton is supported chiefly by contributions and subscriptions. They take patients at very moderate rates of payment, and also paupers.

3881. (*Sir H. K. Storks.*) Is it a large establishment?—Yes, I forget the exact number; there must be 200 or 300.

3882. (*President.*) Then we may also assume, that we should be safe in sending lunatics back to their friends, through whose instrumentality they may go to the county asylums?—Yes; there has been a very great improvement. I believe that every county asylum now is fairly conducted, and some are admirably so.

3883. (*Sir James Clark.*) You judge of Bow, do you not, from the reports of the Commissioners?—Yes, and from some private sources—what people have said; but I have always had a doubt as to the locality, that there could not be space or air enough; there must be great defects, but the patients are kindly treated, well fed, and taken care of.

3884. (*President.*) Is there anything that you would suggest to the Commissioners on this subject? No; I do not know the proportion of the insane to the whole strength of the army. I saw that there were only 117 patients at Haslar, and that out of a navy of 40,000. I do not know how many cases there might be in the army to provide for altogether.

The witness withdrew.

Adjourned to Friday next, at One o'clock.

Friday, 12th June 1857.

PRESENT :

The Right Hon. SIDNEY HERBERT, M.P.
A. S. STAFFORD, Esq., M.P.
Colonel Sir H. K. STORKS, K.C.B.

Dr. ANDREW SMITH.
Sir JAMES CLARK, Bart.
J. R. MARTIN, Esq., F.R.S.

President, the Right Honourable SIDNEY HERBERT, M.P.

Major-General LAWRENCE, C.B. examined.

Major-General
Lawrence, C.B.

12 June 1857.

3885. (*President.*) You have commanded a regiment for some years?—Yes; the second battalion of the rifle brigade, for about nine years.

3886. You have had, I believe, very considerable experience of the internal economy of a regiment?—Considerable.

3887. Have you turned your attention much to the soldier's ration?—Yes.

3888. Do you think that the present ration, speaking of the ration provided by the Government, is sufficient for a man?—I think that three-quarters of a pound of meat is sufficient, provided it is of the quality which is generally issued in England; but I think that the allowance of bread is insufficient, inasmuch as a man almost invariably purchases half a pound himself, in addition to the pound.

3889. So, that including their messing, they consume a pound and a half of bread a day?—Yes.

3890. What is the relative value in quantity of the bread as compared with biscuit?—I am not positive.

3891. Are the means afforded for cooking, in your opinion, adequate?—No.

3892. In hospitals and barracks, what are the means of cooking?—The only means of cooking is by boiling; there are no means either of roasting or of baking.

3893. Do you think that there ought to be?—It is essential that the men should have some means of varying their cooking by roasting or baking.

3894. Do you find that the men complain of the monotony of their food?—Yes; and the old soldiers do not consume all their rations in consequence of the monotony of having it boiled, and they make very great efforts to cook otherwise; sometimes they cook in the barrack rooms, which is contrary to the regulation, but it is occasionally done under the rose to obtain that variety by frying and stewing; and experiments are now making in some of the barracks and at Aldershot, where they have got a baking range put up in the cook house.

3895. Then the fault, I suppose, is that there are no means of giving the men any variety of cooking?—Yes; you cannot do it.

3896. Therefore your answer refers only to barracks where there are kitchen ranges and so on?—Yes.

3897. Supposing they had the means of cooking in different ways, baking as well as boiling, is any change necessary with regard to the cook?—I think that the custom in the service of changing the cooks is a good one; on the whole the men prefer a standing cook.

3898. (*Mr. A. S. Stafford.*) Why do you think that the other arrangement is preferable?—Because you are not then dependent upon one or two men. One man may go to hospital, and you may have no cook; whereas, if they all take their turn, you have a greater number to go upon.

3899. (*President.*) Do those men whose turn it is to cook get any relaxation from duty?—They do no other duty.

3900. For how long a time does each man cook?—From sunrise to sunset.

3901. And on that day the man who cooks is not on parade?—No; he does no other duty.

3902. Still the men prefer having their permanent cook?—They certainly prefer it in the field, where there are greater difficulties; but under the ordinary system of barrack cooking, which is so easily managed, the men, I think, would be satisfied to have it done in succession; and there is an advantage in that, because many men are practised in cooking.

3903. Does one man cook much better than another?—There is very little scope for talent in boiling and making soup, for there is but one dish to cook all the year round.

3904. Do the men ever complain that the cooking is not good, or of a particular man?—Yes; and if he neglects his duty he is immediately brought forward by the men of the company and punished.

3905. Then you would prefer leaving the present system as it is, except that in the field you think that they would be better off if they had a permanent cook to each company?—Yes; but that is a thing which I should leave to the discretion of the commanding officer.

3906. Is the camp kettle a good one for cooking?—The one that we had in the Crimea was of a very bad shape, and very inconvenient.

3907. In what way?—It was so awkward to carry on a man's back.

3908. (*Mr. J. R. Martin.*) The men threw it away, did they not, soon after landing at Eupatoria?—Yes, particularly before and after the Alma they threw the kettle away; but I think that was in a great measure from the awkwardness of its shape, it so encumbered the men.

3909. (*President.*) Was it the old-fashioned kettle, the one that had been a long time in the service?—It was the same shape as the old Flanders kettle, but of a smaller size.

3910. What would you substitute for it?—I should substitute a camp kettle of the shape of the French one.

3911. The Crimean kettle is still used by our troops, is it not?—It is not used now; in time of peace we do not use the camp kettles.

3912. Not at Aldershot?—No.

3913. Not in the summer, when the troops are there?—In all probability the camp kettles will be used; no doubt they will send the troops out to cook, and they may by that time possibly have provided a new camp kettle. I only speak of what we had in the Crimea.

3914. Would you extend to all barracks the cooking apparatus now used at Aldershot?—Certainly the means of cooking. I would also give the men a couple of frying pans to each room for use, not for use in the barrack rooms, but in the kitchen, on the hot plate which is now part of the range.

3915. Is it a good range which they have at Aldershot?—Yes; the new ranges are fitted throughout the camp.

3916. (*Mr. A. S. Stafford.*) On one system?—Yes.

3917. (*President.*) Are they in the cooking huts?—Yes, and they are a great improvement upon the old.

Major-General
Lawrence, C.B.

12 June 1857.

3918. (*Mr. A. S. Stafford.*) Do they do anything but boil?—No; they have no frying-pans or means of baking.

3919. (*President.*) Can they bake?—A new range has just been put up which enables them to bake as well as to boil.

3920. Where is that done—in the huts?—In one of the kitchens.

3921. Has it been put up experimentally?—Yes.

3922. You have a good opinion of it?—Yes; I think it will answer admirably.

3923. Would you give the men the means of baking bread?—That would be afforded by the range I speak of.

3924. Would it be a good thing that they should get used to baking bread?—Yes; it would be very useful in the field.

3925. When you were commanding the rifles had you much occasion to observe the way in which the barrack and hospital repairs were effected?—Barracks particularly, and hospitals also.

3926. Are the repairs done as expeditiously as you think they might be?—Quite the reverse.

3927. (*Mr. A. S. Stafford.*) And as cheaply as they might be?—I cannot speak to the expense—I know little about the comparative expense.

3928. (*President.*) But you can speak to the time occupied?—Yes; and of the very vexatious delay that has often occurred in the repair of barracks and hospitals.

3929. What do you suppose was the cause of that?—From having to pass through two departments—first, the barrack master's, and then the engineers' department.

3930. It has been stated to the Commissioners that the practice is that the barrack-master inspects once a month, and then takes with him all the requisitions for repairs then necessary, are those executed tolerably quickly?—No, certainly not.

3931. And then if a fresh want is discovered the day after his examination must not that stand over till the next monthly visitation?—No, that is open to an "immediate" requisition; but the "immediate" requisitions are very frequent, and very frequently not complied with. In short, the delay in the execution of the repairs is proverbial, and is often very vexatious.

3932. With regard to the ration you said that you thought it was sufficient if the meat was as good as that which is supplied at Aldershot. Have you ever been quartered in Ireland?—No.

3933. At present the soldier is stopped, in England, $4\frac{1}{2}d.$ for his rations, and a further sum not exceeding $4d.$ for his washing and messing, do you think it would be possible or advisable that instead of making that division the government should make but one stoppage, and that the soldier should be supplied not only with meat and bread, but with everything necessary for his other meals?—I consider that by making one stoppage for the ration and the messing the soldier would be a gainer.

3934. Would you extend that to men on board ship?—I would make it a uniform rate of stoppage, at home, abroad, and on board ship.

3935. In order to make it quite even you would have to alter the rate of pay at home, so as to make it the same at home and abroad?—Yes—in the same way that the ration is altered at present.

3936. So that there should be the same balance due to a man whether at home or abroad?—Yes, exactly.

3937. He should have a certain balance of pay and a clear ration?—Yes, precisely.

3938. Do you think that that would be acting fairly by the soldier?—Quite so; because the warrant authorizes a stoppage, not to exceed $8\frac{1}{2}d.$, for rations, messing, and washing.

3939. Have you ever had any practical experience of such a system?—The only thing resembling a stoppage of that sort was, when my regiment, before I commanded it, was stationed in Halifax, in 1841 or 1842, when there was a difficulty in procuring vege-

tables for the regiment, and the commanding officer made a contract with a tradesman to supply them, at a certain rate, with all their groceries and vegetables, and this succeeded so well, that it was continued during the whole time the regiment remained there, and, I believe, with the same tradesman, for about four years.

3940. Did the men like it, or dislike it?—In the first instance they rather grumbled and objected to it, but only in the first instance—afterwards they were perfectly satisfied.

3941. The advantage of that would be, that you would have, when a war breaks out, no change of system to make, either as to the ration or the stoppage?—Yes, and that would be a decided advantage.

3942. Did you suffer much from the change in the late war in the East?—It caused confusion in the accounts, and the old system could not be carried out.

3943. Could the men with their messing money purchase things; was there any market where they could purchase what they required?—In Bulgaria they were able to purchase things to a certain extent.

3944. And even there, there was a change made in the ration and the stoppage, on account of their inability to supply themselves with all that they required?—Yes; after a time.

3945. Even there it broke down?—Yes; and afterwards in the Crimea it broke down entirely.

3946. Do you not think it would be a very great advantage that there should be no change from peace to war, or as little change of system as possible?—It would certainly be a great advantage; the fewer changes the better.

3947. You are of opinion that that would simplify the accounts?—Yes; there would be the one stoppage, and a part of the money transactions between the soldier and the pay sergeant would be done away with.

3948. You might almost say that there would be no stoppage, but that the balance remained the same?—There would be only one stoppage for the ration, and every man would know his balance.

3949. (*Sir H. K. Storks.*) Does not the commanding officer mess his regiment up to the full sum allowed by the regulation?—Not on all occasions; there are regiments at Aldershot where they are messing the regiments at a halfpenny under.

3950. (*President.*) Usually the commanding officers like to mess them up to the full sum for the sake of the discipline of their regiments?—Yes; as long as the men get a good meal (and they complain if they do not get a good meal) you are satisfied. As to the rate of messing, I never wished to spend any more money for my men than was necessary. I never went on the principle of spending the money for the men; as long as they were well messed, I let them have as much money to spend as I could.

3951. Would you extend that uniform stoppage to the hospitals or not? In peace, for instance, would you bring down the present hospital $10d.$ stoppage to $8\frac{1}{2}d.$?—I do not think that the present hospital stoppage is too high or an unfair one, except with respect to the married soldier.

3952. Do you think that you could possibly deal with the married soldier differently from the way in which you would deal with the unmarried soldier?—Yes; you acknowledge a certain number of married soldiers, and you should, I think, adequately provide for them.

3953. That is, you should give them proper bedding and accommodation of that kind, but can you give to a man a different rate of pay, for making a different stoppage is altering the rate of pay?—If he is in the hospital under the full stoppage, his family must almost starve.

3954. But still when you are dealing with a soldier you are buying his services as a soldier, and not his services as a bachelor?—Very true, but you acknowledge a certain number of married soldiers.

Major-General
Lawrence, C.B.

12 June 1857.

3955. (*Dr. A. Smith.*) Do you not at present deal differently with the married and the unmarried soldiers—for instance, the married soldier is not required to take the ration that the unmarried is required to take—he is allowed money to provide for himself and his wife?—Yes.

3956. (*Mr. J. R. Martin.*) Is not the condition of the married soldier rather one of advantage *per se*, inasmuch as the wife washes and assists him in various ways?—Certainly there are many advantages from the regiment, but without those advantages they could not subsist.

3957. In India, are you aware, that the wife receives eight rupees a month?—No, I was not aware of that.

3958. (*Sir H. K. Storks.*) And she gets half a ration abroad?—Yes.

3959. (*President.*) Would it not be dangerous to deal in a different way as to pay and stoppages with one class of soldiers from that in which you deal with another?—No, I do not think it would, so long as you recognize only a certain number of married soldiers.

3960. His rate of pay is supposed to be equivalent to the sort of service which he gives, and whether he is married or single his service is the same—why then should you pay him differently?—The reason I gave before was that you recognize him as a married man, and if you make that large stoppage from him, his family must starve, or next to it, while he is in hospital.

3961. (*Sir H. K. Storks.*) Then you would only give this reduced stoppage to a man who was married with leave, and on the strength of the regiment; that is, six with each 100 men?—Certainly, to that proportion.

3962. Not to all those who receive the commanding officer's permission to marry?—No, it should be limited to that proportion.

3963. (*Mr. J. R. Martin.*) The married soldier is not now made to draw his ration?—It is optional.

3964. When he goes into hospital he must draw it?—He is rationed there.

3965. Therefore you must have a stoppage equivalent to the stoppage for the ration even from a married soldier in hospital?—Yes.

3966. You could not go the length of giving him a free ration because he is married?—No.

3967. On board ship, do you think the same stoppage might hold good?—I would take away the allowance of spirits, which I think does much harm.

3968. On board ship the soldiers mess separately from the seamen, do they not?—Always.

3969. So that there never would be a comparison of the one having a ration with spirits, and the other having a ration without it?—No; they always mess separately. Besides, the one man is working, and the other is comparatively doing nothing.

3970. (*Sir H. K. Storks.*) Do you not think that the spirit ration is a very bad thing?—Very bad.

3971. Except under very special circumstances?—I never knew any occasion on which I considered that anything but evil resulted from the ration of spirits, except in the case of the great state of suffering of the troops in the winter of 1854, in the Crimea. That was the only time that I ever thought it was advisable to give them spirits, in my experience. In other respects I look upon it as an unmixed evil.

3972. (*President.*) Do you believe that the men on board ship contract the habit of taking the spirits, and that they do not shake it off afterwards?—Yes, I do.

3973. You put the temptation in their way?—Yes. There are many young soldiers going out to the colonies who have never tasted rum.

3974. (*Mr. J. R. Martin.*) Would it not be an advantage in the case of a recruit to withhold the spirit ration from him, giving him compensation in other ways?—You could not withhold it from one class and give it to another.

3975. In respect to young soldiers, who are most injured by it, would not that be advisable?—I do not think that you could draw the line.

3976. (*President.*) You might give them tea or coffee, or something in its place?—Yes, I would give them additional tea or coffee.

3977. I think you stated that one of the advantages of a uniform stoppage, besides simplifying the accounts, would be that a better article would be provided, and cheaper?—I certainly think a better article.

3978. Do you think that the commissariat generally do better for the men than the men could do for themselves?—Decidedly. But with all the checks that we have under the present system in buying vegetables and groceries for the men, there is no doubt that it is open to a certain amount of speculation. They bribe the non-commissioned officers who are entrusted to purchase those things for the men.

3979. And they buy an inferior article?—They get a per-centage either in money or in kind. If it is done by the sergeant he gets a per-centage in money, I have no doubt; and if a corporal and a man go to buy those things, they get either a glass of grog or a piece of soap as a bonus to induce them to go to that particular tradesman.

3980. And the tradesman then supplies them with an inferior article?—The troops keep a pretty good check upon that; but they would get better served if it were otherwise.

3981. (*Sir H. K. Storks.*) Would there not be another advantage in certain climates, namely, that you would be able to put some restriction on the diet of the soldier—that is to say, on the vegetables that he eats in tropical climates.—There is no reason when they go out why they should not buy melons or cucumbers, whereas you might regulate what the ration was to be, and give them something more conducive to their health?—Yes, certainly; though I, as commanding officer, would not allow them to buy any vegetables or groceries which my surgeon objected to.

3982. You stated that your men at first were dissatisfied with that system in Canada of supplying them with the whole ration and the messing for three meals—do you think that there would be any dissatisfaction felt now if that system were introduced?—Yes; at first there might be. There always is upon any change a certain amount of dissatisfaction, but I believe after a time the men would feel satisfied with it.

3983. Have you ever consulted any person upon that subject?—I have put the question to several non-commissioned officers and men, and without any exception they have approved of the principle, although they admitted that their comrades might raise an objection and grumble, as they would upon any change; but they were quite satisfied that it would be advantageous to the soldier.

3984. Would you include washing as well as the food in the whole stoppage?—No; for that would take away the legitimate employment of the married people.

3985. Is it not an advantage for the men to wash for themselves?—It is an advantage that the married women should be employed in that way, otherwise it is thrown into the hands of the lowest description of people. This has been the case at Aldershot; we had not a sufficient number of married people at first, and it fell often into the hands of prostitutes, and people of the lowest description, and it gave them an entrance into the camp.

3986. Cannot the men wash for themselves?—In the field they can perfectly.

3987. But at Aldershot?—They could do it, as they have done it in the field, but I do not think there is any reason why they should.

3988. Is there any good reason why the men should not wash their own clothes?—It has not been tested at Aldershot; because when they returned from the Crimea there was a certain number of women, and,

Major-General Lawrence, C.B. according to past precedents, the clothes were put into their hands to wash.

12 June 1857.

3989. (*Mr. A. S. Stafford.*) Do you see any objection to the men washing for themselves?—No; but I think it is desirable that there should be a certain number of married women in every regiment, not only to wash, but for the moral good of the soldiers; and if the men wash for themselves, it would deprive the women of their chief means of support.

3990. (*Mr. J. R. Martin.*) You think it is desirable that the soldier should do for himself everything that he can do without injury to his health and discipline?—I think it desirable to acknowledge and to admit a certain number of women in every regiment. You cannot prevent soldiers marrying altogether, and I think it is better to acknowledge a certain number of women and to maintain them respectably; and one great means of maintaining them respectably would be by washing for the soldiers.

3991. (*President.*) Therefore, though you think that the men should be able to wash for themselves, there ought to be washing enough to keep in employment the women in the regiments?—Yes.

3992. (*Sir H. K. Storks.*) Would it not be a good thing, as Aldershot is considered a camp of instruction, for the men to wash their own things instead of employing women?—I do not think that they require any instruction upon that; every soldier can wash his clothes.

3993. (*President.*) Should you include necessaries in the things to be supplied to them, or would you let them go on buying their necessaries themselves, as they do now?—I think that a soldier would be quite as well supplied, if not better, during a time of peace; for in time of war the system of supplying them regimentally falls through.

3994. What happened in your regiment during the war?—I took out a certain quantity of necessaries, shirts and socks, which I was enabled to carry with the regiment as far as Scutari; beyond that I could not obtain the means of transport, and the greater part of the necessaries were left at Scutari; and at last I was entirely dependent upon the government. At the same time there was the inconvenience of having to write to England for stores for the regiment, without knowing what the destination of the regiment would be.

3995. Latterly did the commissariat issue the necessaries?—Certain articles were issued gratuitously through the quartermaster-general.

3996. As army stores?—Yes.

3997. And the men equally purchasing them?—A great portion of them were issued gratuitously. Trowsers were given to the men, and flannel shirts from private sources, and the necessaries which were afterwards sent out for the regiment remained in hand at great inconvenience.

3998. With regard to shirts and things of that kind, did they keep up their stock by their own resources, or were those issued gratuitously?—I do not think that shirts were ever issued gratuitously; they had to come from regimental sources; Jerseys were. I wanted to explain that there was a necessity laid upon the commanding officer to send for those supplies; but in the meantime the wants were often anticipated by gratuitous gifts of the Government, and from private sources.

3999. Still the system of supplying the men regimentally was an entire failure?—It was; it cannot be carried on.

4000. Therefore, you think it would be better that the men, instead of supplying themselves by regimental contracts, should purchase of the commissariat at all times?—Yes; but I would leave the soldier the liberty which he has at present under the regimental contracts of purchasing for himself, providing he can do so equal to the established pattern.

4001. Only that there should be a supply, from which he can purchase if he likes, provided by the Government?—Yes, with liberty to purchase in the town, if he liked.

4002. (*Sir H. K. Storks.*) With the consent of the captain of his company?—Yes.

4003. (*President.*) The change would be this, that you would substitute the Government contract for the regimental contract?—Yes.

4004. What per-centage of soldiers do you think ought to be allowed to marry?—Six per cent. I think there is no limit as to the number who are allowed to marry; but there is a limit as to the number who are allowed to embark on board ship, and the same limit for the number of rations issued abroad and on board ship, which is the same, 6 per cent.

4005. What advantage has the wife of a soldier who has been allowed to marry, but who does not come in among the number who have half rations?—She is no better off if she is above the number; she would succeed to a vacancy.

4006. Are the regulations enforced upon this head as to marriage?—They are not strictly enforced as to not granting any indulgence to those who have married without permission. The regulation states, that under no circumstances shall soldiers who have married without the consent of their commanding officers be allowed accommodation for their wives in barracks, or to participate in any of the advantages given by the regulations of the service. These regulations are not enforced.

4007. In what respect are they broken through?—In this, that soldiers who have married without permission are taken upon the strength of the regiment, and receive the advantages of those who have married with leave. Virtually it is left to the discretion of the commanding officer.

4008. And you think that evil results from that?—Great evil.

4009. In what way?—In consequence of a man who has married without leave being taken upon the list, the commanding officer has not the power of granting the indulgence of marrying to men of good character.

4010. Why is that done?—It is done from carelessness, and from want of attention to the importance of the subject.

4011. So that you think that the regulations whether revised or not, ought to be at any rate strictly enforced?—Certainly; I think that no soldier ought to be permitted to marry, that is to say, that the indulgence of married soldiers should not be granted to him until he is in possession of one good-conduct badge, which involves a service of five years; and that he should not be granted the permission to marry until he had registered his application for either three or six months; and that the commanding officer should not allow any man, who had married before he entered the service or without leave, to be placed on the strength of the regiment, as a married man, without the sanction of the Commander-in-Chief.

4012. That is, that he should not take any married recruit?—A married recruit would not be accepted, but a number of them get into the army by swearing that they are not married; the army is full of married men now.

4013. (*President.*) Is there sufficient accommodation provided for those who have married with permission, in barracks?—Certainly not; but in the new barracks they are making provision at the rate of six per cent.

4014. That is the number to which you would adhere; enforcing the regulation instead of allowing it to fall into disuse?—Yes; at present the lowest description of women come eventually on to the strength of the regiment, and misery and suffering among the married people is the consequence.

4015. (*Sir H. K. Storks.*) Is not permission generally given to a certain number of married soldiers to reside out of barracks?—Three per cent.

4016. Then that makes nine per cent. in a company of 100 men?—Three per cent. are allowed to live out of barracks, at an allowance of 2*d.* per day.

4017. Six in barracks and three out of barracks?—Yes.

4018. (*President.*) You have turned your attention, I believe, a good deal to matters which are considered necessary for the health of the men, such as the means of recreation within barracks?—Yes.

4019. Do you think that there are means enough of recreation for the soldiers?—No, I think they are miserably defective: there are hardly any means of recreation either for officers or men.

4020. Such as racket courts and ball courts, and so on?—I think they are very defective.

4021. Are there any at Aldershot?—At Aldershot in the encampment there are two ball courts in each of the camps—four altogether.

4022. (*Mr. A. S. Stafford.*) Are they enough?—No; there are now at Aldershot in round numbers about 14,000 or 15,000 men.

4023. And four ball courts?—Yes; but I think that each regiment should have its ball courts.

4024. (*President.*) Is there any cricket ground?—There is one cricket ground which was laid down last year, and is not fit for playing on at present. £100, I believe, has been put in this year's estimates for making another, and that will go no way at all.

4025. And 1,000*l.* are voted for a racket court?—Yes, in the permanent barracks; therefore there would be only one racket court for the permanent barracks and the camp.

4026. The racket court, I suppose, is not used by the men?—No, it could not be used by the men.

4027. It is too expensive?—Yes. Soldiers can never play rackets.

4028. Is one racket court sufficient for the officers?—No, I suppose there are 500 or 600 officers at present at Aldershot, and even in the winter establishment there would be nearly half that number.

4029. Do they ever go over to Sandhurst to play there?—The officers are constantly in the habit of driving over to Sandhurst, which is seven miles off; and the same want is experienced in all the colonies where I have been. I was in Canada for five or six years, and at every station I made efforts to obtain a ball court for the men, but I never succeeded in any one case. As commanding officer I reported the thing and the want of it, but I never succeeded either at Quebec, Kingston, or Montreal.

4030. To whom did you report it?—Through the usual channel.

4031. Did you apply to barrack department?—To the quarter master-general's department through the general officer, and very often a ball court got into the estimates, but it was never done in my time.

4032. Do you approve of garrison libraries?—Yes, very much.

4033. Is there merely a press in which the books are kept, or is there a room where the men can read?—There is a room where the books are kept, but there is no inducement to the men to sit down to read there. It is indifferently lighted, and it is merely a place for keeping books, and from which to issue them—not a reading room.

4034. Are you speaking now of a regimental library or of a garrison library?—I am speaking of a garrison library. There is no prohibition against the men reading there, but there are merely a few forms and tables, and the room is indifferently lighted—so that, practically, the soldiers do not use it as a reading room.

4035. (*Sir J. Clark.*) There is no fire in it, is there?—Yes, there is.

4036. (*President.*) What is the allowance of light?—It is the same as in a room for 12 men.

4037. (*Mr. A. S. Stafford.*) How much is that?—Half a pound the spring allowance, and a pound and a quarter during the winter.

4038. Of candles?—Yes.

4039. (*President.*) Two dips are allowed, I believe?—Yes, about two candles. There is sufficient light to read by, but not sufficient light to make it attractive.

4040. Where there is a reading room, does the soldier attend it, or does he seem to like it?—The 12

regiments at present at Aldershot have all regimental reading rooms.

4041. (*Sir H. K. Storks.*) Are they well attended?—There is an attendance of 1,833 out of a strength of 9,500 men.

4042. (*President.*) Do you mean subscribers?—Yes, the subscribers to the regimental libraries are about 20 per cent.

4043. How was the regimental library established at Aldershot?—In one of the huts.

4044. Is a hut set apart for the library?—It is granted either by the barrack-master as a favour, or the commanding officer puts aside a hut out of the barrack accommodation which is allotted to him for the regiment.

4045. Then he is obliged to pack his regiment a little closer, in order to spare that hut?—Yes.

4046. That is a disadvantage, is it not?—I do not think that it leads to crowding the men as a rule, or that the men suffer from it, but it is certainly taken out of the quarters allowed.

4047. How many men do those huts hold?—They are appropriated for 22 men.

4048. But they would hold more as a reading-room?—I should think double that number of men could sit there if there were forms and tables. The room only has its ordinary complement of four forms and two tables.

4049. Just enough to seat 22 men if they were all there?—Yes, only they usually borrow. This room is not sanctioned by the regulations in any manner.

4050. Do you not think that it ought to be?—Most decidedly. I think that every regiment should have its reading-room.

4051. You say that there are 1,833 subscribers out of 9,500 men. Do the numbers vary in different regiments very much?—Yes. In the Coldstream Guards, out of a strength of 750, there are 350 subscribers; and in the 2d battalion of Rifles, out of a strength of 700 men, there are 256 subscribers. But then it should be remembered that these regiments have libraries of their own.

4052. Have not the others?—No.

4053. Have not all the regiments libraries of their own?—No, not soldiers' libraries.

4054. Why is one regiment to have it and not another?—Regiments are generally deterred from having libraries on account of the expense of carrying them about.

4055. (*Sir H. K. Storks.*) You mean private libraries?—Yes; I was drawing a distinction between garrison libraries provided by the public and the libraries that I spoke of, which are purchased by the soldiers.

4056. (*President.*) Surely the public provides regimental libraries as well as garrison libraries?—No.

4057. (*Mr. A. S. Stafford.*) Can you state the smallest proportion of subscribers in any regiment?—The smallest number of subscribers of any of the 12 regiments is 76.

4058. Out of how many men?—Out of 780.

4059. Which regiment is that?—That is the 22d.

4060. Was that regiment about to move?—It has only just arrived in camp at Aldershot.

4061. (*President.*) That would make a difference, would it not?—Yes, I think so. It should be borne in mind that all regiments coming into Aldershot are expecting to move. My opinion is that if these regiments were stationed in a garrison where they had the prospect of remaining any time, the number of subscribers would be very much increased.

4062. Have they no lamps in any of those huts?—They have never been recognized, but during the last winter a special application was made for light, and the use of two moderate lamps has been granted.

4063. In the garrison library?—No, at the regimental library. Two lamps were granted during the winter.

4064. Has it not been extended to the spring and summer?—No.

*Major-General
Lawrence, C.B.*

12 June 1851.

Major-General
Lawrence, C.B.

12 June 1857.

4065. Were they sufficient to light them?—I should think so.

4066. (*Mr. J. R. Martin.*) Have the men any theatrical amusements?—Nothing. The officers have had private theatricals, and a large hut is set apart for them.

4067. But none for the private soldiers?—No; I do not think there is for the private soldiers. They attend and witness the private theatricals of the officers, but there is no place set apart for the men.

4068. (*Sir H. K. Storks.*) Have there been any lectures given at Aldershot?—Yes, throughout the whole of the winter.

4069. Were they well attended?—Yes, decidedly.

4070. On what subjects were the lectures?—They were very varied, scientific; natural history, astronomy, &c.

4071. And on military subjects?—Some on military subjects also.

4072. Were they well attended?—Yes.

4073. (*Sir J. Clark.*) What is the amount of subscription that the soldier pays?—On the average about 3d., and 1d. for the garrison library.

4074. For how long a time?—A month.

4075. (*President.*) How are those subscriptions applied; how is the money spent?—In lighting the room, and providing extra light, papers, and periodicals.

4076. They get additional light beyond the two dips?—Yes.

4077. What is the regulation as to the newspapers; do they get any newspapers that they choose?—Subject to the approval of the commanding officer.

4078. (*Sir J. Clark.*) Do the government choose the books which are supplied?—Yes, for the garrison library; and the books or newspapers for the regimental library are allowed to be introduced subject to the approval of the commanding officer.

4079. (*Sir H. K. Storks.*) That is quite a regimental arrangement?—Quite so.

4080. There is no regulation in the service authorizing the admission of newspapers into the regimental libraries?—No; they are not recognized by the regulations of the service.

4081. Is there any regulation in the service prohibiting the admission of newspapers?—No, not that I am aware of.

4082. Do you see any danger in their admission into the regimental libraries?—On the contrary, I think it most desirable that newspapers should be introduced into regimental and garrison libraries.

4083. Why so?—Because the troops in the present state of things are flooded with all sorts of newspapers of the lowest and worst description, and I think it most desirable that they should be supplied with newspapers and periodicals of a good moral tendency in order to counteract the evil effects of the publications which they not only meet with at all the public-houses, but which are sent to them in such numbers by their friends.

4084. (*Sir H. K. Storks.*) You do not think that the admission of a good wholesome newspaper would have any dangerous effect on the discipline of the army?—Quite the contrary.

4085. You know that soldiers receive very objectionable publications and prints from their friends?—Most objectionable.

4086. (*President.*) What are those objectionable prints; are they penny papers?—Yes.

4087. (*Mr. J. R. Martin.*) Your view is, that as the men will read something, care should be taken to provide them with the best?—Yes; in order to counteract the effects, not only of the radical, but of the infidel publications which are disseminated amongst them.

4088. (*Sir H. K. Storks.*) You are of opinion that it would be better that those newspapers should be allowed by regulation under some legitimate control, than that the men should read all sorts of questionable publications?—Certainly.

4089. (*President.*) You cannot prevent access to the others, but you think that the men would prefer to read a good article if it were put before them?—Yes, if it were provided for them in the garrison library.

4090. (*Sir J. Clark.*) Who takes care of the regimental library, and issues the books to the men?—A librarian is appointed from among the men.

4091. (*Mr. J. R. Martin.*) Would you encourage men who have practised trades to pursue them for their own benefit at the different stations; that has been found beneficial in the East Indies with European troops?—Yes; I dare say that can be done in the East without taking them away from their duties as soldiers.

4092. They are encouraged to cultivate small gardens, and to dispose of fruits and vegetables for their own benefit; and all those indulgences have been found to diminish both sickness, mortality, and crime, especially in the European regiments of the East Indian Company; should you approve of such indulgences?—Yes, if it can be done; but I should question whether in temperate climates, where, a soldier is called upon to perform so many more duties than in the East, it would not interfere with his duties as a soldier.

4093. But where it could be done, you would be disposed to approve of it?—Certainly. With regard to what I said as to the newspapers, I beg to add this, that all newspapers issued to the garrison libraries should be selected by the monthly board of officers from a list approved by the Secretary of State for War.

4094. (*President.*) You stated, that accommodation was being provided for married women in barracks?—Yes, in the new barracks at Aldershot.

4095. What space is given to each?—11 feet by 10.

4096. For each couple?—Yes.

4097. (*Sir H. K. Storks.*) Do they have a separate room?—Yes; with a small oven beside the fire-place.

4098. Is that accommodation provided in the proportion authorized by the regulation, of six women to 100 men?—Yes.

4099. Has it ever occurred to you that it would be possible to build in the rear of barracks a sort of model lodging-house which might be let out to married soldiers at a weekly rent?—I think that would be a decided advantage, as it would provide respectable accommodation for them, and move them away from the men.

4100. And you would keep them more under regimental control than you could do now?—Certainly.

4101. Do you think it would be popular among the men, that they should pay a small weekly rent, to be fixed by a board of officers?—Yes, and they would be better and more economically lodged, instead of straggling about a town and getting wretched accommodation.

4102. And you would keep them more under regimental control?—Yes.

4103. (*President.*) Do you know the Guards' lodging-house for married soldiers?—No.

4104. Have you ever contemplated selling coffee and so on in the garrison libraries?—I have known coffee sold in a regimental library abroad; in Canada, it succeeded very well.

4105. Do they ever smoke there?—In some regiments it is prohibited by the men themselves, but in the majority it is allowed in the regimental library huts.

4106. You think that the garrison libraries should all be made into reading rooms as well?—Yes.

4107. And that they should be supplied with newspapers, and so on?—Yes; they are already supplied with a certain number of periodicals, but I think the great attractions to a library are the newspapers.

4108. (*Sir J. Clark.*) Does one man read out to the others?—No, not commonly.

4109. (*President.*) If you made the garrison library as good as that, would it interfere with the regimental library?—Not materially.

4110. Do you find that the regiments which subscribe most freely to the one subscribe to the other too?—Yes; in my own regiment, when there has been the greatest number of subscribers to the regimental library, there has been a proportionate subscription to the garrison library instead of taking away from the numbers.

4111. Have you any change to recommend with regard to the supply of newspapers, or would you leave that as it is, in the discretion of the commanding officer?—So far as the regimental libraries are concerned, I would suggest that if the garrison library is situated upwards of half a mile from the regimental one, or if no garrison library exists, that the regimental library should have the privilege of drawing periodicals and newspapers, and have an allowance of light in the same way as I proposed for the garrison library, of course paying the same subscription.

4112. You would proportion the number of papers to the number of subscribers?—Yes.

4113. With regard to the canteens, would you make any change in the regulations with respect to them?—I am not prepared to make any suggestion as to them.

4114. They are now, I believe, under a very improved system, and they do not sell spirits?—Yes.

4115. (*Sir H. K. Storks.*) Would it not be desirable to have a comfortable public room attached to each canteen, where the men could have coffee or tea and smoke their pipes and converse?—It would be a great attraction.

4116. Do you think it would be attended with good results?—I think it would, but I would attach the room that you describe to the reading room.

4117. (*President.*) So that they would be able to smoke and get coffee just the same?—Yes.

4118. And they could read there too?—Yes, it has been tried in several garrisons.

4119. (*Sir H. K. Storks.*) With success?—Yes, and we are about to try it at Aldershot.

4120. (*Sir J. Clark.*) If the men had an opportunity of getting coffee early in the morning it might prevent them from taking spirits?—Yes, it would, and it would be a great help to a man who wishes to give up dram drinking to have a cup of coffee to fall back upon.

4121. (*President.*) Can you offer any suggestion as to any improvement in the clothing?—I think the soldiers' boots are open to great improvement. It is essential on service that a man should have either leggings of the same description as those worn by the French,——

4122. A pair of gaiters?—Yes, or a laced boot sufficiently large to admit of the trousers being put inside; more like the English shooting boot, so that you might put the trousers inside and lace the boots over them; and the want of that was shown by the expedient that the soldiers resorted to in the Crimea, who made a sort of legging out of the material of which the bales were made containing the clothing, a sort of sacking; every man in the trenches had them on, and it was a great protection.

4123. With regard to the shako, have you any improvement to suggest?—I think it is essential to consider the appearance as well as the comfort of the soldier; with regard to the shako I am not prepared to recommend any other head-dress as a substitute for it. On taking the field I would send the shako into store, and depend entirely upon the forage cap.

4124. (*Sir H. K. Storks.*) Would not you change the forage cap, and give it a peak?—I do not think the peak is of much value.

4125. Do you like the material of the present forage cap?—Yes, I think it is serviceable; if it were a little larger it would be better.

4126. Is it not very difficult to keep it in shape, uniform?—No, I do not think it is.

4127. (*President.*) If you have a peak do you prefer the English or the French peak?—Certainly the

French. The old English peak did more harm than good. It came down upon the nose and caused heat without protecting the eyes in the least.

4128. (*Sir J. Clark.*) Would not a peak protect the eyes in summer weather?—I take the instance of three regiments in the brigade that I commanded at the latter part of the time in the Crimea; two of them had had peaks throughout the whole campaign, and one of the regiments, the 47th, had a great many cases of ophthalmia; the 41st had no peaks during the whole campaign, and I do not think that they had a single case of ophthalmia.

4129. There were two regiments with peaks?—Yes, very much of the French pattern. The 47th and 49th had very good peaks during the whole campaign.

4130. And one of them had cases of ophthalmia?—Yes, the 47th; but the 41st were without peaks and had no cases of ophthalmia.

4131. (*President.*) The ophthalmia did not prevail in both the regiments which had peaks?—No, in only one.

4132. (*Mr. J. R. Martin.*) What are the advantages of the forage cap over the shako?—That a man can put it under his head, and it is not liable to be destroyed; whereas if you rest your head upon the shako you destroy it, and it is spoiled by the mud, and is very inconvenient both under canvas and in bivouac.

4133. Is there any head-dress that fulfils the object of the soldier being able to lie down with it, and its being to a certain extent sabre and bullet proof at a given distance?—No, I know of no head-dress that combines these qualities.

4134. But these are the objects aimed at in the soldier's head-dress, are they not?—Not so much protection from wounds as protection from the weather.

4135. Would not a light kind of helmet fulfil those objects more than any other head-dress?—Do you mean made of felt?

4136. Yes.—I am doubtful about the helmet; I think it would be very hot.

4137. They are made now, I believe, with ventilating openings?—I think it would be liable to the same objections as the shako on service, as being very easily destroyed.

4138. Military men have never as yet agreed upon the one head-dress proper to the foot soldier; it is still a desideratum in the army, is it not?—Decidedly, it is still a very open question.

4139. (*President.*) Would you make any substitute for the stock?—Not on home service. I do not think the leather stock on the whole can be improved upon for home service.

4140. Is it necessary to have it so thick and strong?—I do not think that the thickness makes it less comfortable, it is the height.

4141. Are they reduced from what they used to be?—Yes; they are lower now.

4142. And not so thick?—They are nearly as thick.

4143. On service, what would you recommend?—I would give a handkerchief on service.

4144. That looks very bad, does it not?—I mean a handkerchief that would wash, not the black handkerchief that was issued in the Crimea, but blue like the French.

4145. (*Mr. J. R. Martin.*) Would not horse-hair be more suitable for peace and war?—No; it would chafe the men's necks, and become almost like a rope round their necks.

4146. (*Sir H. K. Storks.*) Does not the stock from its tightness often cause men to fall out when they are marching quickly or doubling?—When a soldier has any really hard work to do, and wishes to use any great exertion, the first thing he does is to take off his stock.

4147. (*President.*) Do you like flannel or cotton shirts?—Flannel.

4148. At all times?—At all times, both on service and in quarters.

Major-General
Lawrence, C.B.

12 June 1857.

Major-General
Lawrence, C.B.

12 June 1857.

4149. (*Mr. A. S. Stafford.*) Do you think that the knapsack could be improved in the manner of fitting it on to the soldier?—Yes; I think they are improving it at the present time.

4150. Do you know Mr. Berrington's plan?—I am not quite certain that I do by that name, but I have seen almost all of them.

4151. (*Sir H. K. Storks.*) Do you think that socks are essential to a soldier?—Yes.

4152. (*President.*) Would a looser fatigue jacket be a better thing for the soldier?—I should substitute either a jersey frock or a canvas jacket, like the Austrians, for the shell jacket.

4153. (*Sir H. K. Storks.*) Do you think that the present great coat is a useful article?—The quality of the coat is very inferior.

4154. Would not a coat of lighter material be better, in which the men could march, more like the French great coat?—Yes, of a better description of cloth.

4155. And of lighter materials?—Yes; our great coat neither keeps out the wind or the wet.

4156. In the morning, when a man has been out all night on sentry, if he has to march early it is almost impossible, is it not, to fold a wet great coat?—Yes.

4157. And therefore the man is put to great difficulty in carrying it?—Yes; a wet great coat he cannot fold.

4158. (*President.*) Do you think that the tente d'abri could be introduced with advantage into the English service?—Yes.

4159. Not as a substitute for the bell tent?—No.

4160. How would you manage with two kinds of tents, you could not carry both?—I proposed to many of the soldiers in the Crimea, to carry a portion of the tente d'abri, and a piece of waterproof cotton or duck not exceeding 2 lbs. in weight, which should be used as a water deck to lie down upon, or as a cape, or to form a part of a tente d'abri, and they considered the advantages such, that they did not at all object to the additional weight of a pound and a half; the bell tent would be carried for them.

4161. Can you have waterproof cotton for a tent?—We had a great many different materials submitted for trial in the Crimea. I am not certain, but I think it was duck.

4162. Is it the custom in the service, so far as you know, to consult the medical officer in the selection of ground for an encampment?—I should say not. It is left to the discretion of the commanding officer. I should say that the medical officer is not much consulted.

4163. Do you think that he could be consulted with advantage?—Decidedly.

4164. Would it be desirable to attach a medical officer to the quartermaster-general's department in the field, to advise him on points of that description?—Very desirable.

4165. (*Sir J. Clark.*) If such an officer was appointed, would you have him attached to the quartermaster-general's department, without being under the inspector-general?—I should have him independent, and to report direct to head-quarters, to the general commanding.

4166. (*Mr. J. R. Martin.*) Being the officer of health of the army?—Yes, the officer of health attached to head-quarters.

4167. Your view is that to exercise that function he should be kept separate from the class of officers who treat sickness and wounds?—Yes.

4168. And that his duties should be especially sanitary?—Yes.

4169. (*President.*) Would he not come into collision then with the principal medical officer?—I should conceive not.

4170. Suppose that the principal medical officer differed from him as to the salubrity of any particular site?—He would not be an executive officer. The Commander-in-Chief would still be at liberty to take the opinion of the principal medical officer.

4171. (*Mr. J. R. Martin.*) Meanwhile you would consider that this sanitary officer should in all cases be a high authority, on account of his acquirements?—Yes; on sanitary subjects.

4172. (*Dr. A. Smith.*) Knowing, as you well do, the various duties which a soldier has to perform, what number of meals do you think he ought to be allowed daily, to give him sufficient nourishment?—Three meals, breakfast, dinner, and supper.

4173. Of what should the breakfast consist?—Tea or coffee, and bread.

4174. Would you consider that sufficient, supposing that a man may be out from 5 o'clock in the morning till nearly 8, at heavy drill?—I should answer that first, by saying that I do not think it is at all desirable to take them out, if you can avoid it, upon an empty stomach, but to give them their breakfast first.

4175. Then suppose that a man had not been out, but had been moving about for an hour or two, would half a pound of bread and a pint of coffee be sufficient for a strong six-feet man in vigorous health?—Very frequently they buy butter, &c., but judging by the general health of battalions, I should say that the bread and bowl of coffee that the soldier gets are sufficient for him.

4176. At dinner he is allowed three quarters of a pound of meat; probably an ounce of that three quarters is lost by bone, and another ounce by cooking or boiling away in the soup; do you think he would be able to spare any of that, or that he could not eat more than that at dinner?—They frequently dine on the soup and reserve a portion of the meat for the supper.

4177. Could they reserve any portion without robbing themselves of what they really wanted at their dinner?—I should think that they would consume more, and as a general rule that they would desire a larger amount of meat.

4178. Then of what should the evening meal consist?—Tea or coffee.

4179. And bread again?—Yes.

4180. (*Mr. J. R. Martin.*) Do you not think that the meat ration should be increased, so that some portion of the dinner should remain over for the supper?—I have assumed that the three quarters of a pound of meat, if it is as good in quality as it is under the present commissariat arrangements in England generally, and at Aldershot, is sufficient for them.

4181. Leaving some remainder for the supper?—That is quite optional with the soldier. All the meat is cooked at dinner, and if it is kept it is reserved for his supper.

4182. Do you think that the ration ought to be increased when the troops are employed on active service?—Yes.

4183. Have you seen the scale recommended by the Crimean commissioners, and do you approve of it?—I see that the fresh meat is 16 ounces; but the meat generally issued in the Crimea was not worth half the quantity of the meat which is issued at home.

4184. That is a suggestion as to foreign service, and supposing the meat to be indifferent?—The sixteen ounces in the Crimea were not equal to eight ounces of the meat that is given at Aldershot.

4185. (*Sir J. Clark.*) Is it not the general practice of the men now to purchase articles to eat with their breakfast and to eat with their dinner?—It is the general practice to buy a herring or butter, or an egg, and such things; but I look upon it more as a change and a relish than to supply a want of nature.

4186. Do you think that in this climate three-quarters of a pound of meat, losing so much by bone and cooking, is quite sufficient for an able-bodied man for a day's subsistence?—I think that it is a sufficient amount of animal food.

4187. In intense winters in Canada, did you find that the troops required more animal food?—I think not.

4188. (*Mr. J. R. Martin.*) The British ration was the usual ration?—The ration of meat is one pound in Canada instead of $\frac{3}{4}$ as at home.

4189. The camp kettles at present in use are only suited for the preparation of soup and bouilli, are they not?—The camp kettle is only suited for that.

4190. (*President.*) Am I right in supposing that when a soldier has been on guard for 24 hours, and returns to his barrack, he is not allowed to lie down in his bed till tattoo?—Yes.

4191. So that he might be kept without sleep except what he gets upon the guard bed for 36 hours. Could you not do for him what the police do, they allow the men to go to bed for a given time after their return from their beat?—In hot climates we used to let the men put down their beds and lie down after they had had their dinner.

4192. Do you mean the whole of them?—Yes.

4193. I referred to a man who had been kept out of bed during 24 hours, would it not be an advantage to him to go to bed for some limited time, instead of waiting till tattoo in the evening?—The barrack-room hardly admits of that, if the beds were let down

in the middle of the day, the men could not have their evening meal.

4194. (*Mr. A. S. Stafford.*) The space would be too limited?—Yes.

4195. (*President.*) They are eight hours on sentry?—Yes, and 16 hours off, so that they get a good deal of sleep.

4196. (*Mr. J. R. Martin.*) The duty as sentry being two hours each time?—Yes.

4197. (*Mr. A. S. Stafford.*) He is always four hours off?—Yes, and two hours on.

4198. During the four hours he may sleep?—Yes.

4199. Either by day or by night?—Yes; they get so much sleep that I do not consider they suffer for want of it.

4200. You do not consider, after your experience, that they suffer any hardship?—Not at all. I never heard it started by the soldier; they usually go on with their usual duties when they come off guard.

4201. (*Mr. J. R. Martin.*) But night duties, when they have been severe, have been found to affect the health of troops?—Yes, a constant recurrence of duty on guard will tell very much upon the men's health.

The witness withdrew.

Major-General MANSEL, K.H., examined.

4202. (*President.*) I believe you have formed an opinion as to the sufficiency or insufficiency of the soldier's ration?—I have.

4203. What is your opinion as to the quantity?—I do not think that three-quarters of a pound is sufficient.

4204. Have you seen it in a good many districts?—I have. I was quartermaster-general in Ireland for five years, and I afterwards commanded the southern division in Ireland, which comprised six counties, and I gave a great deal of attention to the subject, but it must be remembered that the meat in some parts of Ireland was inferior to the meat which the last witness spoke of. I do not think that anybody, looking at three-quarters of a pound of meat, would consider it sufficient after it is boiled, and when you take the bone out of it, it is a mere bit, and as to keeping any part of it over for any other meal it could not be done. In military prisons they give to the first-class prisoners on Sundays 10 ounces of meat, that is, it must weigh 10 ounces after it is boiled without bone, and to produce that 10 ounces it would require about 13 ounces of raw meat.

4205. It would require rather more than that, I think?—It might require more, but it depends very much upon how the meat is fed.

4206. But they receive that only on Sunday?—Yes.

4207. And on week days they have none?—No; their food generally is Indian meal, or oatmeal.

4208. Is that sufficient to keep a man in health?—Yes. He is weighed constantly; the medical officer watches over him, and if he loses weight he is at once put upon superior diet.

4209. Upon the whole they weigh rather lighter, do they not, on coming out than on going in?—In some cases. There have been instances where they have weighed more, but generally speaking they might weigh a little less; but I am satisfied that the food is sufficient. You must keep them in condition, so that they might be able to go on escort or any other duty the day after they come out, and they should be fit to undertake that duty.

4210. In the barracks do you think that the cook houses could be improved?—Certainly.

4211. By giving additional means of cooking?—Yes, and by improving the grates. The coal that is issued, when it is slack very small riddled, passes entirely through the grate; there are large divisions,

and therefore the whole of the coal is not consumed. If it is good round coal, it is quite a different thing.

4212. Have you seen any of the improved stoves?—No, I have not.

4213. Do you think that they ought to have the means of baking?—Yes, and all that was recommended at the time of the cholera, by the medical gentlemen. A circular was issued, showing that that was quite requisite; but without reference to cholera I consider that they should have ovens to bake in, and so have a change of food.

4214. Was anything done in consequence of that recommendation?—Nothing; it fell to the ground. But I have always urged, and Sir Edward Blakeney, in his orders to me always urged that they should have ovens in every barrack, and we did everything in our power to have them constructed.

4215. It very frequently happens, does it not, that medical recommendations do fall to the ground?—They do, they are not always attended to.

4216. (*Mr. A. S. Stafford.*) But you think that they are generally of such a nature as to deserve attention?—Yes, and I give you a case in point. Speaking of the ovens, the men like it themselves, and their messes are improved by the grease and the fat from the meat falling on the potatoes when baked with the meat.

4217. (*Mr. J. R. Martin.*) Have you always observed that variety in the mode of cooking is desired by the men?—Not a doubt of it.

4218. (*President.*) What is the amount of hospital accommodation which is laid down for every barrack?—You will find in the regulations that it is 10 per cent.

4219. Do you think that that is sufficient?—For contagious diseases I would have other wards. I believe that some medical gentlemen are of opinion, and I agree with it, that you should have a ward for ophthalmia, and a ward for typhus, and a ward for small pox separate, and without reference to the 10 per cent.

4220. Should you have space enough?—I think so, with the additional wards for the several contagious diseases which I have detailed, and a convalescent ward.

4221. Would it not be an advantage to give each man in the hospital rather more space?—I think that they are too crowded, and that there should be more space between the beds; many of the wards are too low. In the hospital at Cork the height of the lower

Major-General
Lawrence, C.B.

Major-General
Mansel, K.H.

Major-General
Mansel, K.H.

12 June 1857.

wards is 10 and 11 feet, and of the upper wards 9 and 10 feet. I think they are too low, but I may here refer to another subject, namely, the cook-houses; they never should be within the walls of the hospitals, but in the yard. When I was at Cork, I visited the hospital frequently, and I found that if you have the cook-house under a ward you cannot occupy the ward that is above it, and that is very objectionable. I did everything in my power to get it altered. I represented it over and over again, but I did not succeed.

4222. To whom did you make your representation?—To the authorities, and it would of course go to the general commanding in Ireland, and he would forward it. The Commissioners must not suppose that I wish to blame the engineer; he has not the means, he would send the matter forward; he has only means to meet incidental expenses.

4223. (*Mr. A. S. Stafford.*) Is the hospital at Cork a badly constructed hospital?—No; but still it is objectionable on account of the deficient height of the wards and the cook-house being within the walls of the hospital.

4224. (*Mr. J. R. Martin.*) Is there a convalescent ward in the hospital at Cork?—No, there is not, that I have also reported over and over again, and Dr. Maclean, who is at the head of that department, fully concurred with me.

4225. (*Sir James Clark.*) Is the situation a good one?—Yes.

4226. (*President.*) It is not usual, is it, to have the cook houses within the walls of the building?—I know several that have, but I think it is quite wrong.

4227. Have you ever seen any of the naval hospitals?—No, but I have heard them very well spoken of. I understand that they are superior in every sort of way.

4228. Who inspects the meat and so on?—The meat is inspected by a subaltern, but I think that those inspections are very defective. It is just like the case of forage; they are inspected by subalterns, many of them lately come into the service, and inexperienced to deal with so important a question, and I think it should always be the captain of the day, and that they should look more diligently into the matter of inspection, because their powers are very great, and if the captain of the day objects to the meat, a committee is ordered at once, and if it is condemned, the commanding officer may then go to the market and buy fresh, charging it to the contractor.

4229. In the barracks do you think that there is a sufficient number of sheds for the formation of the guards?—No; I think you should have more sheds in a barrack for mounting guard and other duties. If the men are taken out on parade for the purpose of forming them, and it is a wet day, they must get wet to a certain extent. Therefore there should be a shed for the formation of the guards. In most barracks there is nothing of the sort.

4230. Is the hospital furniture sufficient?—I do not think it is. I think that shirts for the men should be provided by the hospital department.

4231. Instead of their taking them out of their own kits?—Yes.

4232. And with regard to other articles, such as crockery, and things of that kind?—I think that they also might be better managed by the barrack-master. With respect to crockery in barracks, if he is called upon to provide crockery he is bound to do it at no expense to the soldier, but if the soldier breaks any article it is a barrack damage, and therefore the soldier in the barrack does not like to take the basins and plates. The remains of the mess are generally given to the person who supplies the potatoes, and she gratuitously provides basins and plates.

4233. Are the privies and accommodations of that description good?—I think they are bad, and that they ought to be improved—they are not what they should be; but it must be remembered that I speak not of this

country, but of Ireland. I do not think that the privies are good. When I was at Cork I used to look into them myself, I never failed to inspect all of them when making the periodical inspection of the several corps and stations in the district, and I have recently pointed that matter out. There is another point which I may mention, which is, that the privies are too far from the barracks, and I will give the Commissioners an instance. At Cahir there is one range of buildings in one spot, and another range of buildings in another, there are about 117 yards from one block of barracks to the other, and for any man who may happen to be taken sick there is no privy in the rear of the barrack, but he is obliged to go across the square in all weathers to reach the privies; I do not think that they are well constructed. Then with regard to the sanitary condition of the soldier. A well disciplined seasoned soldier will cost the Government, I think, at the lowest calculation 100*l.*, therefore in the end the Government would gain by looking to sanitary matters. I always insisted in my division on the privies being emptied constantly, and having turf mould and peat charcoal used so as to deodorize them, and the same with the ash-pits. I do not think that those matters are looked to sufficiently. There is an idea entertained by some people, that the medical men are not sufficiently consulted; but I always gave my orders to the effect, that the commanding officer should go round the barracks constantly; and I conceive also that it is the duty of the medical officer to go round and point out to the officer commanding upon the station whatever might require to be noticed, just as the medical officer did every day to me at Cork; he reported to me that everything was sweet, and I went round myself in order to verify those statements.

4234. Is it the case, that with all commanding officers the advice of the medical officer would be well taken?—I can only say, that I should do it for the benefit of the soldier, and I should feel obliged to the medical officer for his advice; and I have always impressed upon the minds of commanding officers that they should attend to those things.

4235. Would it not be well to secure that by making it a matter of regulation that a medical officer should make his report?—If it is in any way defective now, certainly I would do it.

4236. So that it should no longer be optional with the officer commanding to take the medical officer's opinion or not?—Certainly, I think that he should do so, and I conceive it to be the duty of the medical officer to go round and inspect, and report whatever he may see wrong, having reference to the sanitary condition of the soldier. It is his business to notice that to the commanding officer; so that if there is a nuisance, that nuisance may be abated, and if this is not sufficiently clear at present, I would issue some order to make it clear.

4237. (*Mr. J. R. Martin.*) Upon the daily inspection, would you have the officer of the day associated with the surgeon?—It might be so; I can only say that I have rather felt it a pleasure than anything else to go round and see that every part of the barrack was wholesome.

4238. But such an inspection is not a matter of regulation now anywhere?—Then it should be. My orders in my division were perfectly clear; there could be no mistake about it, that they should go round, and every commanding officer would attend to those orders.

4239. (*Sir James Clark.*) The medical officer reports the number of sick each day?—Yes; and at the same time he might report anything relating to sanitary improvements; I had some excellent medical officers with me at Cork, who always came and reported to me what they thought necessary.

4240. (*Mr. A. S. Stafford.*) As a general rule, do you think that the number of the medical officers is sufficient?—I embarked 50,000 men at Cork, and sometimes with so large a mass we found a difficulty about medical officers; but I think that is more a

medical question, and for the medical gentlemen to answer; I have not found that there is any great want generally, but sometimes it has occurred. In time of war you have an increase.

4241. (*President.*) With regard to the question of the ration, do you think it would be an advantage to give to the men a whole ration, consisting not only of bread and meat, but including also vegetables and coffee sufficient for three meals, and make one stoppage over the whole?—I must not go out of my depth on that question. If the question refers to at home as well as abroad, then I do not think that at home the stoppage for bread and meat is bad, and I would let him buy vegetables. The prices of the market vary so; you will find at a place like Tralee that you can get meat for 3½d. a pound, and potatoes for 3d. or 4d. a stone; and then when you go to another place, you would find the price is double, therefore it would be a question.

4242. Would it not be an argument in favour of the suggestion that that arrangement would protect the soldier against the variations of the market?—Yes; the practice is to send a non-commissioned officer out, and there is no doubt that they do get a bonus, they have been frequently punished for it whenever it has come to my knowledge. I have on more than one occasion tried non-commissioned officers and soldiers for things of that sort.

4243. Would it not be an advantage to have as far as possible some system of providing the troops in peace as well as in war?—Certainly.

4244. Do you think, except with regard to the difference of price in the markets, that there would be any disadvantage in giving the soldier for one stoppage enough to keep him perfectly efficient and in health?—I should prefer at home a stoppage for bread and meat, and that he should out of the other money provide himself with vegetables, pepper, and pay for his washing.

4245. You think that where the markets are very low, as in a cheap country, the soldier has the advantage?—Yes.

4246. But in a dear part of England there it would be an advantage to him to have those things supplied to him?—Yes.

4247. Is it not very important that you should take care wherever the soldier is, that he should always have at his disposal enough of food to keep him efficient?—Yes, but I should say, that I would rather have the man go to market himself; when practicable he prefers it. I think he does better for himself. In all large barracks people bring in vegetables from the markets, and they have the privilege of selling them, and there is also the benefit of competition, and one regiment sees what another regiment pays.

4248. But your opinion has been formed principally in the districts where the necessities of life are very cheap, and where the soldier gets the full benefit of that state of things?—Yes.

4249. But in proportion as he gains by cheapness in one place, he must suffer by the dearness in another?—Yes, he must. I think I shall in a few days be able to lay before the Committee the rates of messing the whole of the Cork division, which was under my command, and then the Commissioners will be able to judge; but I think the soldier would prefer buying the vegetables himself.

4250. (*Mr. J. R. Martin.*) You think that he would rather take his chance of the dear and cheap markets?—Yes.

4251. (*President.*) The soldiers preferred the system of regimental contracts for bread and meat, did they not?—Yes, they did.

4252. And yet the change has worked beneficially?—I think so; but there were many objections made to it. There is only one thing that I have a doubt about, namely, that the commissariat sometimes do not give so good an article in the meat as the men got by the regimental contracts; I remember that the artillery held out to the last, and they never would have anything to do with the commissariat; while

the line were receiving from the commissariat the artillery obtained their supplies from their own markets, but that is now broken through.

4253. (*Mr. A. S. Stafford.*) Which system do you think worked the best?—I do not know, but the artillery have been compelled to come into that, but I think the soldier likes to go himself, and he sees the people bringing in the potatoes; I am talking merely of Ireland, there all these things are very cheap. When the bread and meat were bought by regimental contract it was done by the quartermaster under the authority of a board of officers, and the contract was taken precisely the same as it is now.

4254. (*President.*) Suppose such a plan were adopted, would it hold good in your opinion in hospitals?—I think that all contracts in hospitals, where there is no purveyor, are looked to by the senior medical officer; he takes from the contractor the meat.

4255. Are you of opinion that the tenpenny stoppage ought to be maintained in hospitals, or would you lower it to the stoppage of the soldier outside?—It bears hard upon the married soldier, but I think there are many worthless characters who are themselves the persons who cause the disease; I do not think that they should be favoured; they should not have an accumulation of money.

4256. You would have, would you not, malingering if you did not make the stoppage the same amount over and above that which the healthy soldier is exposed to?—Malingering is watched very closely, and when detected is punished very severely; but it does occur sometimes, and sometimes it is hard to prove a case of malingering, but I think if you did anything with hospital stoppages it should be in this way, that the hospital stoppages should be on the same footing as what the soldier pays for his messing outside. Then, again, there are certain things which are required by the sick soldiers; for instance, they may require wine or other comforts, that are expensive to the government.

4257. With reference to a reduction of the tenpenny stoppage, the only reason that has been given is, that it presses hard upon the married soldiers. Do you think that of sufficient importance to induce you to lower the stoppage?—In the annual estimate you will find that the expense of the hospitals is above the mark.

4258. (*Mr. J. R. Martin.*) It exceeds the hospital stoppage?—Yes, it does, and there are certain comforts which are very expensive, such as wines, and therefore the question is, what is to be the expense? he would be at an expense outside to the extent of 8½d., and therefore I think under any circumstances the hospital stoppage should be not less than that charged for his daily requirements.

4259. The hospital stoppage was founded on the expectation that the ration which feeds the man in health should cover his treatment in sickness, except the cost of medicines, and the pay of the medical officers; and you say that it does not do that?—No, it does not. The last annual estimate will show you that at once.

4260. (*Dr. A. Smith.*) Three years ago did it not more than cover the expense?—I do not think so. There is another point that I would refer to. You should discourage the marriage of soldiers in every way, as it causes great embarrassments to all movements of troops; and therefore I say, with respect to an answer that was given by the last witness, as to having buildings outside for married soldiers, it would be an encouragement to marriage, and it would embarrass you beyond anything that it is possible to conceive.

4261. (*President.*) You would not do anything to facilitate the marriage of soldiers?—No.

4262. (*Sir James Clark.*) It was only intended that the house suggested out of the barracks should accommodate the percentage of married people that is allowed?—I did not understand it so. There is another thing, that the marriage of soldiers must be recognized. You are bound by your regulations to

Major-General
Mansel, K.H.

Major-General
Munsel, K.H.

12 June 1857.

register the marriage of every soldier, whether he has been married with or without leave. You must put down the letters W. L. in the register, and it is an extraordinary thing that there have been instances in which property has been recovered for the children of soldiers by reference to the military register, and they had no other means of proving their title. Therefore I have always enforced, in the strictest way, the registration of every soldier's marriage.

4263. (*Dr. A. Smith.*) But, suppose a soldier married without leave, his wife and family would not be entitled to any of the advantages accorded to those who have married with leave?—No; but the restrictions are frequently taken off as vacancies occur.

4264. (*President.*) Are the present allowances of coals and candles sufficient in the barracks?—I do not think they are; and I think that the coals would go further if the matter was properly regulated. The coal yard should be covered in, for nothing deteriorates so much as coal does, from exposure to weather. All the slack that lies about in an uncovered coal yard, receives the wet, and it becomes spongy, and that coal is served out by weight, therefore you get water. If the Commissioners were to examine the barrack-masters, they would find that they are bound to take stock once a year, and it will always be found to the advantage of the Government; that there is a certain quantity of coal over the issue, and that it is caused by what I have stated, of course to the disadvantage of the soldier; and then the grates that they burn it in are of no use; it runs down through the grates and mixes with the ashes, and it is taken away.

4265. You think that the coal would be sufficient if it were good?—Yes; if it were good round coal, it would go much further; but I would not, without some trial, assert that it is sufficient.

4266. But you will not say that the men are sufficiently warmed?—No; I do not think they are. In cold weather they are very cold, and I would give them more coal, and it would, no doubt, add to the health of the men. In inclement weather I have applied for an additional allowance, and in the meantime authorized it; for several days would elapse previous to the receipt of an answer, and then the weather might have become milder. Superior officers in such cases should have discretionary power. I have not hesitated to authorize the issue, after having consulted the medical officer.

4267. And more light in the same way?—Yes; they are miserable candles. When I was quartermaster-general I framed a certain code of regulations that no coal should come into any barrack without having been properly tested by a competent board; and that they should see some of it burnt before it is accepted, and precisely the same with the candles, for they are miserable things. You should introduce gas into the barracks wherever it can be introduced. You should give the soldier more light in his barrack; and with regard to the reading rooms, I think those reading rooms are very comfortable; they should be made as comfortable as you can, and give them light and fire; the fire is not sufficient.

4268. (*Mr. A. S. Stafford.*) You are in favour of reading rooms?—Yes; I have always found, according to the accommodation in the barracks, that the books were sufficient; the War Department was always ready, if you made any suggestion as to any other book, to attend to your suggestion.

4269. (*Sir James Clark.*) Therefore, you think that the reading rooms should be made as comfortable as possible?—Yes, I think so, but I do not agree with the gentleman who preceded me; for you very frequently see soldiers go into the library and select their books and come out again, and go and read to three or four men in the barrack. I know that from my own observation, there can be no doubt of it. I have taken a great interest in this subject, and I may be excused for saying that I am the person who established the military prison system; this with libraries, and the evening meal, has reduced crime

in our army beyond what any person can imagine. If you visit a military prison you rarely see a case of re-committal.

4270. (*President.*) Which of those three causes would you put the first?—It is difficult to say; but I gave the same attention to the other two points as I did to the military prison system; I worked at that for five years, and I visited several of the gaols in England and Ireland; I was afterwards examined before Lord Cathcart's committee, and there can be no doubt that the other points are equally good.

4271. (*Mr. J. R. Martin.*) In the instances of military prisoners who came out of prison of equal or superior weight to what they were on entering the prison, what on the average was the duration of the confinement?—That is a question that can be easily answered, although I cannot answer it at the moment.

4272. It has been found that long confinement is invariably injurious to health?—You must recollect this, that any suggestion of the medical officer of the prison upon that point is always attended to. I am no advocate myself for long confinement, and in confirming the proceedings of a court-martial, I have invariably said to the medical officer,—“Inform me if you consider that any man is suffering from any cause, and if you think that he should be released, I will remit the remainder of the punishment at once.” Then there are visitors to those prisons; and if they see any man who is suffering, they at once recommend that he should be forgiven.

4273. (*Sir J. Clark.*) With regard to spirits, what do you think is the effect of them among the troops?—The regulations as to the canteens have been very much improved. I ordered a board to ascertain what the prices in the market were, to confer with the canteen men, and to regulate the prices at each canteen, so as to satisfy myself that no soldier was imposed upon by the prices charged at the canteen, the prices being put on a board in some conspicuous place in the canteen; but I am no advocate for spirits.

4274. Do you think that if the men could obtain coffee at the canteens, that would be as good?—I think wherever you can introduce coffee, it is so much the better. A man gets a very good allowance of very fair coffee in the morning, or tea when he comes in, and there is no reason why he should not ask for his cup of coffee as well as for beer. In Ireland they will have their whiskey, and there is every inducement there for a man to drink whiskey; and one great inducement is this, if a man goes in and asks for a solitary glass of whiskey he pays a penny for it, but if he takes two he only pays 1½d.

4275. (*Mr. J. R. Martin.*) Would you approve of a well-ordered canteen being attached to the library?—There was a question with respect to smoking sent round to all the army, and the opinions of all were gathered, and I am afraid that where they had the means of smoking so much, it would turn the library into a pot-house, and I should not be for that.

4276. My question referred to a well-ordered canteen, where the men could obtain coffee and be permitted to smoke?—If you could get coffee at the library well and good, but I should be averse to smoking in the library, they would spit about and make a terrible mess.

4277. (*Mr. A. S. Stafford.*) But there would be much less attraction to the library if they could not smoke?—I think the attraction to the library is sufficient if you give them a cup of coffee, and I believe the majority of officers are against smoking in the library.

4278. (*Mr. J. R. Martin.*) But that would not apply if the canteen were attached to, or adjoining to the library?—Where your canteen accommodation is ample in a barrack, without reference to the library, I would not allow smoking in the library; they might have coffee.

4279. (*President.*) Is there any other point as to which you would wish to offer any suggestion?—There are two matters, drainage and the construction

of barracks. With regard to the construction of barracks, some people think that the medical officer has not a voice in a matter of that sort; but I should say that every engineer officer and every other officer would seek the opinion of the medical officer as to the site of any public building. In a hospital he is the person to consult; and when I was in Ireland as quartermaster-general under Sir Edward Blakeney, his positive orders to me were, that no building should be constructed at any point without having a board appointed, and that one of that board should be a medical officer.

4280. (*Mr. J. R. Martin.*) But there is no army regulation to that effect?—I do not know that there is; but I should say, that wherever there is a department such as the quartermaster-general's department, it would not be done without consulting the medical officer, and if any engineer officer under my command was to do anything of that sort without consulting the medical officer, I should consider it my duty to take notice of it, and make a representation to superior

authority. But in such cases I should invariably order the district engineer officially to confer with the medical officer, so far as related to the sanitary question.

4281. (*Sir James Clark.*) Have you known of a hospital or a barrack having been built directly contrary to the advice of the medical officer?—I know of none. I seek for the opinion of the medical officer on these points, and I think that any officer relieves himself from a certain responsibility when he does so. In all such important matters as the building of a hospital or a barrack, there should be a board of officers, a competent medical officer being one of that board. Then with regard to drainage, I think that surface drains are objectionable, and these are points which medical officers frequently bring under notice, and I give orders accordingly. My idea of the construction of a barrack is this, that the underground plan should be more clearly laid down on paper than the other part.

Major-General Mansel, K.H.

12 June 1857.

The witness withdrew.

Adjourned to Monday next, at One o'clock.

Monday, 15th June 1857.

PRESENT :

The Right Honourable SIDNEY HERBERT, M.P.
Col. Sir H. K. STORKS, K.C.B.
Dr. ANDREW SMITH.
T. ALEXANDER, Esq., C.B.

Sir JAMES CLARK, Bart.
J. R. MARTIN, Esq., F.R.S.
Dr. JOHN SUTHERLAND.

PRESIDENT, The Right Honourable SIDNEY HERBERT, M.P.

Dr. JOHN SUTHERLAND, a member of the Commission, examined.

4282. (*President.*) Will you state the steps that were taken by yourself and your colleagues to carry out the instructions that were given to you by the Commissioners?—We first went to Paris, and placed ourselves in communication with the embassy. Lord Cowley unfortunately was about to leave for London, but several medical gentlemen whom I had known for years in Paris were kind enough to afford us facilities in obtaining information. We then proceeded to inspect the following hospitals, which we selected as affording examples of the earlier as well as of the latest and best forms of construction, namely Beaujon, La Ribosière, the Hotel Dieu, La Charité, Saint Louis, Saint Antoine, the unfinished military hospital at Vincennes, and the great military hospital of the Val de Grâce. There is a small military hospital, at Gros Caillou, which we did not visit because we thought it best to see the latest improvements. While making these inspections, we made examinations and inquiries into other matters contained in our instructions; such, for instance, as the dimensions of wards; the cubical space allotted to each patient; the state and means of ventilation; the cleanliness, the state of the latrines, the nursing, &c. The measurements were taken by Dr. Alexander and myself, partly by pacing, partly by direct measurements, he recording the dimensions, which will be laid before the Commission. We further examined or obtained information on matters connected with army medical education, how it was carried on, and the extent of it. The attention of my colleagues was also particularly occupied with the ward arrangements; and we obtained minute information as to the general administration, the state of the bedding, furniture, &c., in the wards. After completing the inspection of the hospitals, we examined two barracks. The newest one, the Caserne Napoleon behind the Hotel de Ville, and a large cavalry barrack, which was specially examined by Dr. Mapleton.

4283. (*Sir H. K. Storks.*) What cavalry barrack was that; was it at the Quai D'Orsay?—Yes; on these various subjects we obtained information both from personal inspection, and from communications with gentlemen connected with the army, who gave us their opinions. We also collected upon their recommendation a number of books and documents which appeared to us to contain very full information on some points in our instructions. We did not consider it necessary to remain sufficiently long in Paris to digest this information, so as to be prepared with a detailed account of our proceedings. We sent the documents to London, but I believe they have not yet arrived and passed the custom house; and until they come into our possession the information we can give to the Commissioners will only be of a general character.

4284. (*President.*) Do you propose to put in a written report hereafter?—We propose to put in a digest later of the documentary information which we have received. (*See App. Nos. LXXVI., LXXVII., LXXVIII.*) We can give you our own impressions from the whole inquiry now; but with regard to the more minute details, perhaps it would be better that those should appear separately afterwards as a sort of appendix. Having completed the examination of the Paris hospitals, we proceeded to Brussels and placed ourselves in communication with the Minister at War. We inspected three hospitals there, the military hospital, the hospital of St. Peter, and the hospital of St. John, both of which are civil hospitals; we also examined the most recently constructed barrack, known as Le Petit Chateau, which is said to be the best in Belgium. Having obtained what appeared to be sufficient information in regard to the establishments at Brussels, we closed our inquiry and returned home after being absent from London 14 days.

4285. To go back to the general construction of the hospitals which you inspected, what account do you

Dr. John Sutherland.

15 June 1857.

Dr. John
Sutherland.

June 1857.

give of them?—The general construction of all buildings that have been specially erected in Paris for hospital purposes is as follows:—The wards are large, long, and narrow, and tolerably lofty. They have a range of windows along each side, with beds between the windows, generally one window to two beds, or about that proportion, an arrangement which admits of abundant admission of light and of natural ventilation, if the windows be properly used for the purpose. In some of the older hospitals, such as in the older part of the Val de Grâce, there is a bed between every two windows; but that portion was not originally constructed for a hospital. In the newer wards of Val de Grâce, erected about 1841, the space between each two windows is wide enough to admit of two beds being placed in it, about 24 to 30 inches apart. Each pair of beds is separated from the adjoining ones by rather more than the breadth of the window space. I have known the hospitals in Paris for nearly 30 years, and the improvements which have taken place in that period both in hospital construction and in sanitary arrangements are very remarkable.

4286. (*Sir J. Clark.*) You are speaking now from your own observation?—Yes; however much there may be still to do in the way of improvement (and much yet remains to be done), the improvements which have taken place have been very great indeed.

4287. (*President.*) Does that apply to the civil as well as to the military hospitals?—Yes.

4288. Is the construction of the civil hospitals in Paris better than the construction of similar hospitals in London?—It would be difficult to answer that question generally, for the construction of the civil hospitals varies very much in this country. We have civil hospitals with windows on both sides, and we have civil hospitals with windows only on one side and with a dead wall opposite.

4289. Could not you in London match any of the civil hospitals in Paris?—I do not think that we have any hospital in London equal, all things considered, in construction to La Ribosière, excepting the latrines; but if that comparison were wanted more completely, I could run over the London hospitals again for the purpose of forming an opinion.

4290. Which was the best hospital that you saw in Paris?—I think the best constructed hospital in use was La Ribosière. The upper wards in St. Louis are very large, lofty, and airy; and the new hospital at Vincennes will be a very good one as regards construction when it is finished.

4291. (*Mr. J. R. Martin.*) Is that on the model of La Ribosière?—No; the difference is that in La Ribosière the wards are built in detached blocks or pavilions placed side by side, and 68 feet apart, each pavilion containing three wards one over the other; while at Vincennes the pavilions are placed end to end, with intervening staircases. You go up a large staircase and a ward opens on each side on every landing, the end of the ward being towards the landing. In the wards at Vincennes, as in those of La Ribosière, the windows are on opposite sides of each ward, so that there are cross lights right through the ward, and a window for every two beds. One of the pavilions on each side at Vincennes consists of large wards running nearly the whole length of the pavilion; and the adjoining pavilion is divided into a larger or smaller number of wards by cross partitions with intervening doors, which I consider to be a defective arrangement, as the partitions interfere with ventilation, and the doors admit of direct intermingling of the atmosphere of the wards.

4292. Vincennes you think will be the best?—I think it will make a very good military hospital, but I am of opinion that it is not a good arrangement to have wards communicating with each other directly by doors without intervening lobbies.

4293. (*President.*) The hospital is in the form of the letter E, is it not?—Yes, something of that form. I will describe the hospital La Ribosière a little more minutely, as it is the most recently constructed civil hospital in Paris, and exhibits the most recent im-

provements. The hospital La Ribosière is situated near the northern railway station, in a comparatively open position. The buildings are arranged round a large centre parallelogram 370 feet long by 140 feet wide, tastefully laid out as a garden. The whole hospital is built of hewn polished stone. It consists of eight pavilions or blocks, and a chapel, with other subsidiary buildings. All the pavilions are detached, but the whole establishment is connected by a single corridor 10 feet 4 inches wide and 17 feet high, consisting of arches filled with glass, running round the court, only on the level of the ground floor, and the pavilions are projected outwards from the corridor, and communicate with it only at one end. Two of these pavilions are connected together by intervening arches to form the entrance front to the hospital. They contain the administrative offices, the kitchens, consulting rooms, pharmacie, dwellings, &c., for the officers. Behind these, on either side the court and garden, are three pavilions, each three storeys high, for the reception of sick. Next, there are two pavilions, one on either side, which contain the linen stores, washhouses, &c. Between these two pavilions, opposite the entrance gate, and completing the square, is the chapel, beside which are the baths belonging to the establishment. Behind the chapel is another court surrounded by buildings used as reception houses for the dead, for post-mortem examinations, and for lectures. Beside these buildings are the summer drying grounds connected with the laundry. Each pavilion, as I have stated, is three storeys high, and the end which touches the corridor is wider than the rest of the building, to afford space for a wide roomy staircase which affords the means of communication with the different flats of the pavilion, and also for a small diet kitchen, portable bath, and nurse's room. Each pavilion is separated from the one next it by a distance of about 68 feet, and this space like the court is laid out as a garden. The distance between the wider parts of the adjoining pavilions is 53 feet. Each of the three flats in the pavilion consists of one large ward 111 feet six inches long and 30 feet wide, and at the end furthest from the entrance is a part cut off by a wall and glass doors, and lighted by a large end window which contains the latrines, a foul linen closet, and a small ward for two sick. The wards on the ground floor of each pavilion are 17½ feet high, those on the first floor are 16 feet 8 inches high, and those on the second floor are 16 feet 4 inches high. (*See plan No. XLI. of Appendix.*)

Each ward has 16 lofty windows 4 feet 8 inches wide, 8 on each side, extending almost from floor to ceiling, and capable of being opened like the common French window. The walls and ceilings are coated with highly polished cement in imitation of coloured marble, and the floors are of polished oak. The beds, 16 on each side of the ward, are placed two and two between the windows. They are five feet four inches apart from centre to centre, but they are 10 feet eight inches from centre to centre measured across the window. The distance from foot to foot of the beds across the ward is about 16 to 17 feet. The bedsteads and bedposts are of iron, and are provided with white dimity curtains; and each window has curtains of white gauze.

The cubic contents for each bed are, for the ground floor 1,860 cubic feet, for the first floor 1,740 cubic feet, and for the second floor 1,700 cubic feet. Each bed has a good cane-bottomed chair and bed table belonging to it. Everything about the wards appeared perfectly neat and clean.

The great structural defect in these wards is the want of water-closets, in lieu of which are open latrines with tubes descending to the basement of the building. These latrines are cut off from the wards by a ventilated corridor with double doors, and they have, besides, special means of ventilation, but they were offensive, and the smell from them could be traced even into the ward.

The water supply for each pavilion is obtained from a cistern at the top of the building.

The means of ventilation I will refer to by-and-bye.

The bath establishments contain hot and cold baths, 12 in number on each side, and separated by curtains from each other. The common portable bath is used. The bath room is warmed and ventilated, and contains a hot closet for towels. The walls are coated with polished coloured cement. In another room are shower, douche, and hot vapour baths, and there is a tube for applying steam locally. There is a third apartment with hot air and medicated air baths, and a fourth for sulphureous baths.

The linen is washed by steam, and there are good drying closets. The clean linen store, which is in the same pavilion, is beautifully clean and in the most perfect order. It was in charge of one of the sisters.

The kitchen is also very complete, and abundantly supplied with every requisite.

The corridor running round the basement to connect the whole establishment affords the means of exercise to convalescents in bad weather; and above the corridor is an open terrace entering from the first floor of each pavilion, on which patients were walking or reclining at the time of our visit.

The construction of this hospital presents certain very obvious sanitary advantages, amongst which may be enumerated, 1st, dividing the sick, upwards of 600 in number, among six separate and detached buildings, so that there are about a hundred sick only under one roof; 2nd, the isolation of these buildings so that the air can circulate freely between them; 3rd, the large amount of window space for ventilation and light in each ward; 4th, the impervious materials of which the walls, ceilings, and floors are formed; 5th, the abundant supply of baths; 6th, the easy means of communication, and the facilities for moderate exercise for patients.

The great structural sanitary defect, as already mentioned, is the want of proper drainage and water-closets. The pavilions might have been placed advantageously at a greater distance, and it would, in my own opinion, have been better to have had only two flats in each pavilion as is the case in one or two similar hospitals elsewhere.

4294. (*Mr. J. R. Martin.*) Does not La Riboisière purport to be an improvement upon the hospital of St. John at Brussels?—St. John is built upon the same model as La Riboisière, the model is the same only that St. John is not so good, except that it has only two flats of wards, but the distance between the blocks is much too small, and the means of ventilation are totally inadequate.

4295. Therefore La Riboisière is an improvement upon the hospital of St. John in Brussels?—Yes, it is better than the hospital of St. John.

4296. (*Sir J. Clark.*) You say that during the last 30 years the improvement in the hospitals in Paris has been immense; in what respect?—The things that struck me as especially remarkable were the much greater purity of the air in the wards, and the much greater cleanliness, also the greatly improved sanitary construction of the more recent hospitals. With regard to Brussels the military hospital there is an old convent, consisting of a square of buildings, part of which contains two good wards. These wards are large and lofty, but the wards in other parts of the building are very low and by no means well adapted for the purpose. Saint Peter is a rich foundation, and consists of large wards with beds well apart, and plenty of cubic space for the sick. The windows are placed on opposite sides of the ward with the beds between them. St. John, as I have stated, is arranged like La Riboisière, but it is not so good an example of that principle of construction.

4297. With regard to ventilation, what observation did you make?—It is perhaps better in replying to the question not to enter into a discussion as to the merits of different systems, for I hold ventilation to be an art, in the exercise of which we cannot supplant intelligence by machinery; I shall, therefore, simply

state the various plans we found in use, and the condition of the air in the wards at the time of our visit. I believe that the unfinished military hospital at Vincennes is the only hospital in Paris in which provision for a specific system of artificial ventilation has been made at the time of its construction. In every other instance, I believe, ventilating machinery has been introduced after the hospital was built; but there is an evident disposition to extend combined systems of artificial ventilating and warming in hospitals and other buildings. The methods of ventilation adopted in the Parisian hospitals are the following:—First, ventilation simply by windows and doors.

4298. (*Mr. J. R. Martin.*) Natural ventilation?—Yes; this plan is used in the Hôtel Dieu, in the great hospital of Saint Louis, in the hospital of the Val de Grâce, and at Beaujon, except in two pavilions. In Saint Antoine there are windows and doors which may be used for ventilation, but at the same time they have small ventilators in the windows.

4299. (*Sir J. Clark.*) What was the state of the ventilation in those hospitals that were ventilated in this way?—It varied very much. In the upper wards at Saint Louis a large cubical space is allowed for the sick, and the wards are very lofty, nearly 24 feet, the windows go up to the very top of the ward, and the upper part of the windows can be opened; the air in those wards, whatever objection might be raised against the number of beds in them, was pure. In the Hotel Dieu, the air was not so pure. In the Val de Grâce the air was pure, on the whole, in the newer wards which have been erected, and in the older wards it was tolerably pure. I have been in hospitals where the air was perhaps purer, and in others, in this country, where the air was by no means so pure; but, on the whole, I cannot say that the ventilation in this military hospital was altogether what it might have been. It was certainly very much better than it was formerly, and very much better than I have observed it in some hospitals in London.

Of ventilation by machinery, there are three kinds in operation, two at La Riboisière and the third at Beaujon. My experience as regards the ventilation of La Riboisière is perhaps a little different from that of my colleagues, for I specially examined it at a time when experiments were going on in cold weather, for the purpose of ascertaining the relative merits of the two systems which are used in ventilating this hospital. At the time to which I allude the windows and doors were all shut, and the ventilation was exclusively carried on by the machinery.

On one side the ventilation was introduced by M. M. Thomas and Laurens, and is accomplished by a fan which draws air down a large lofty chimney from the roof of the hospital, drives the air through a large iron air-trunk, passing under the corridors, from which trunk there are lateral branches passing under the wards, and those lateral branches divide, and are conveyed up in the walls, and there they divide again, so that a branch passes under each ward in succession, and sends the air out at fixed points in the floor. Those fixed points consist of pedestals very much like a French stove in form. There are four of those pedestals in each ward on that side of the hospital where the air is thrown in by the fan. Each pedestal is 4 feet 1 inch high. There is a grating 26 inches long by 8 inches wide on the top of each through which the air passes into the ward. These pedestals contain steam apparatus for warming the injected air in winter. When the doors and windows are shut, the air can only come into the ward through these openings. The impure air escapes as follows:—Between each two beds on the level of the floor is an opening about 8 inches square communicating with a shaft which is carried up in the thickness of the wall to the roof.

4300. Is that a branch of the shaft that you mentioned?—No; that is the outlet shaft. Then, about 8 or 10 feet from the floor in the same shaft there is another opening also, about 8 inches square, and

Dr. John Sutherland.

those two openings are used in order that the air may escape either above or below the beds. When I examined this hospital in cold weather, the upper openings were closed, and the air entered by the pedestals and escaped by the openings on the level of the floor, passing in that way over the bed of the patient, and in every part of that ward there was the most distinct impression of a gentle moving atmosphere over the face and hands, but no draft. There was no odour whatever until you passed through the glass door into the latrines, and there there was an odour; but none within the wards.

4301. Was the upper opening shut in all the wards?—Yes; at that time.

4302. Did they give any reason for that?—Yes; the reason given was, that the ventilation was intended to prevent the effluvia from the patients intermixing with the air in the wards, and the air from those pedestals made a sort of curve over the beds of the sick and between the beds, and then escaped below. The air was escaping steadily by 16 ventilating openings in each ward, and the power of the current was easily tested by placing a lighted lamp in the escape flue.

4303. (*President.*) Did not that cause too much disturbance of the air?—No; certainly not, at that time the ventilation was just sufficient, and was as nearly perfect as machinery could make it.

4304. (*Sir J. Clark.*) Could you draw out the air through the wall by those tubes?—If you shut the lower openings and opened the upper ones, then the air would be drawn out by the action of the shaft.

4305. Was there any suction power used?—No.

4306. It was merely left to itself?—It was merely a case of repletion. The ward is kept full of air, which is allowed to escape as it can up these shafts, and another means of escape is the pipe of the latrine, which communicates with the external air, and as the whole ward was kept full of air, part forced its way through the doors to the latrine and down the shaft to prevent the effluvia ascending into the wards. On the opposite side of La Ribosière there is another system in operation, that of M. Léon Duvoir, which differs considerably from the one I have been describing to you. It consists of a fire-place burning a small quantity of fuel, in which is a series of hot water pipes. The hot water pipes are led from the fire-place up the chimney, and thence under the roof into a chamber where they form a current by heating the air in the chamber. The object of that is to rarefy a large body of air which is allowed to escape afterwards through a chimney erected on the summit of the pavilion, and the vacuum so produced is supplied by air drawn through shafts from the wards to be ventilated, the intention being to empty the wards of the air by 16 openings between the beds of the same dimensions, and through the same number of shafts, as on the opposite side of the hospital. The air to supply the vacuum is admitted through three circular pedestals, five feet six inches high, placed down the middle of the ward, which pedestals communicate by a cross shaft under the floor with an air brick on each side of the ward, the air coming in under the floor to supply the vacuum produced by rarefaction, ascending through the pedestal where in winter it is heated by hot water pipes, and passing over the beds, and then up the shafts, the moving force being suction, and this plan has been considered almost perfect. I shall state in what condition the air was in the wards when I saw the plan in full operation in cold weather. The ventilation was defective on that side, and there was no movement in the air over the face and hands, similar to what was observed on the other side. There was also odour in the wards. Without referring to the unsettled dispute as to which system of ventilation is the cheapest and most effective, I can nevertheless state that either from the supply of air being too small, or from the means employed to draw it out not being sufficiently powerful for the size of the wards,

the air on that side was by no means so pure as on the opposite side of the hospital. This hot water plan of ventilation is advocated both in France and in this country on the ground of its superior economy, and it is certainly much more economical, both in first cost and in current expense; but the only opinion I can give on either plan regards the healthy state of the wards, and the efficiency or inefficiency of the system in use. The other day when we were at La Ribosière the ventilating arrangements were in a different condition from what I have described, on account of the warm season. On the side on which the air is drawn out, that process was not in operation, but I have no hesitation in saying, that with the number of open windows which then existed, and on which the ventilation depended, the state of the air in those wards was very much better than it was when I formerly examined that hospital—that is to say, it was better with the window ventilation when the apparatus was totally disused, than when the apparatus was in use and the windows closed. (*See Appendix No. XLI.*)

4307. When did you see it, when the apparatus was in use?—In 1855.

4308. At what season of the year?—In the end of October. As to the other side, during our recent examination, the fan apparatus was not in full use; it was partly in use, and the windows were partly open; there was as much dependance upon the natural ventilation as upon the machine ventilation. I do not think, therefore, that we were in a position to judge of the efficacy of the artificial system. I think we were of opinion that the air was purer on the side where there was no artificial ventilation going on than on the side where the ventilation was partly natural, partly artificial. There is a third system, that of M. Van Heecke, in operation at Beaujon. That hospital consists of an old private residence to which four pavilions have been added for a certain number of sick. There are 20 beds to a ward, and 60 sick to a pavilion. One of those pavilions is ventilated in a somewhat peculiar way. It is a system of ventilation that has been in use in this country for factory purposes. In the basement of that pavilion there is a large zinc tube, within which revolves an Archimedean screw driven by a half-horse power engine. This screw drives the air into a furnace and over an iron bell, which heats it in winter, and in that state it is projected into the centre of the lower ward of the pavilion, where it escapes through a pedestal, and then passes along the ward, and out at the four corners of it. Four tubes have been put up, one in each corner, with two openings in each tube at different heights, by which the air is drawn out by a screw above; but in La Ribosière there is an opening between each two beds, while at Beaujon there are openings only at each corner. The inlet air tube having given out a quantity of air to the lowest ward is diminished in size, and carried up through the ceiling to the floor of the ward above, and it there gives out air in the same way, which escapes in a similar manner. The tube is again diminished in size, and is carried to the ward above where it terminates. These are the three systems of artificial ventilation in use in Paris. At Beaujon the windows were open when we were there and the machinery was stopped, so that the pavilion was ventilated by natural means alone. The moving power at Beaujon is much more economical than at La Ribosière, where for 306 beds a force of from 10 to 12 horses out of a 20-horse power engine is required to drive in air, as against a half horse power at Beaujon for 60 beds. Another pavilion at Beaujon is ventilated and warmed by the same vacuum plan in use at La Ribosière. It is stated, as the result of this latter plan, that the air in the wards has been purified, that the odour of wounds has disappeared, and that epidemics of erysipelas, phagedena, and gangrene have ceased, while these diseases still exist in the unventilated pavilions of the same hospital; so far as we could learn hospital epidemics are very rare in the better class of hospitals.

A modification of those artificial systems is being introduced at the hospital at Vincennes. It is the plan of M. M. Grouvelle & Co., and consists of a shaft about 100 feet high from the basement, carried up to the roof between each two pavilions. The shaft is about 14 feet square. Along the whole arched basement of the two pavilions there is an immense air sewer carried towards this shaft, and this air sewer extends from one end of each block of wards to the shaft. Into this air sewer there are lateral air drains which descend from the wards to the basement. The structural peculiarity in the system is, that from the three floors of wards, air shafts descend to the underground basement before they reach the air sewer, and before that air sewer conveys the air to the large fire at the bottom of the shaft, which is the means of ventilation; the means of drawing the air out. Then, as in La Riboisère, there is an outlet shaft for every two beds and an opening of about 10 inches square placed in the shaft between each two beds, near the level of the floor, while there is another into the same shaft near the ceiling above from 8 or 10 feet from the floor, and those openings are placed so that they may be used as they may be required, either the one above or the one below, to draw off the foul air. Fresh air is introduced as follows: there are double walls carried from the lowest part of the building to the highest at one end of each pavilion, so as to form a large inclosed space or flue, within which the air can pass up; and the air is supplied to this inclosed space upon the level of the ground outside through open basement windows. In order to warm it in winter, there are placed large hot-water vessels at the lower end of each shaft, over which the air has to pass before ascending the flue, and having got to the level of each ward branches are sent off all along the ward, and they give out this air in the centre partly by gratings and partly by pedestals, as in the other artificially ventilated hospitals; and the foul air as already stated is drawn off by the down-cast shafts between the beds to the fire and draft chimney in the basement. The difference between this system of ventilation and the other systems is, the much larger size of the inlets and outlets for air. The usual defects in artificial ventilating arrangements arise from the inlets being too small. The inlets in this case are very large indeed, but still it is doubtful whether even they will be sufficient to supply the 2,220 cubic feet of air per bed per hour required by the contract. That is, I think, as much as I can say upon the artificial ventilation in use. I do not believe that any machinery will ever entirely supplant intelligence, but I think there are instances in which artificial ventilation has arrived at considerable perfection, and there are cases in which it would be of service.

4309. (*President.*) I do not quite understand the distinction that you draw. You say that machinery will never supplant intelligence, but machinery must be carried out by intelligence, must it not?—Yes; my meaning is, suppose you use machinery which acts perfectly when doors or windows are shut, and a door or window is left open accidentally, the machinery would cease to move the air.

4310. You mean that it would never be self-acting?—Yes; and that it would not be safe to trust to it. Just as it would be unsafe to trust to any other complicated machinery without exercising care and intelligence. An intelligent person acquainted with the subject of ventilation, will be able to ventilate any ward either by natural or artificial means; an unintelligent person will not do it well any way.

4311. (*Sir J. Clark.*) To ascertain the effects of those different modes of ventilation you ought to visit the hospitals in winter?—Yes. We ought to carry out the investigations by day and by night also. If the Government for its own special purposes wishes to ascertain which system of ventilation is the best, there ought to be a special inquiry into that subject.

4312. (*President.*) Have you now finished on the subject of construction?—Yes; I have stated what struck me as the most important.

4313. Have you included the description of the Brussels hospitals, or was there anything peculiar in them which you would wish to state?—With regard to ventilation, I will endeavour to describe the system which we found in use in Brussels in two wards of the military hospital there, and I must say that the simple means which were in operation there struck me perhaps more, individually, than any other. The windows were shut, and yet the air was pure. The wards are lofty, and there is a large amount of cubic space allowed for the sick. They have the windows chiefly on one side and at one end. In the lower ward there are four semicircular openings in the ceiling against the wall, one at each corner, about two feet in diameter, and these semicircular openings are carried up to the roof. There are four of them in the lower ward, and in the upper ward are three circular openings, each about two feet in diameter, along the centre of the ceiling, also carried up to the roof. I inquired about the effects of that mode of ventilation, and the intelligent director who accompanied us stated that when the temperature of the air outside very nearly approximated to the temperature of the air inside, the ventilation became defective, but under ordinary circumstances, especially during cold weather, when the air was colder outside than it was within, then the ventilator acted well. It appeared to me, individually, to be a simple and very efficient system, for the air in both wards was remarkably pure.

4314. (*Sir J. Clark.*) Were those openings for the purpose of admitting the air?—Yes. The air seemed to make its way in partly by the doors, and partly by the windows, and partly by the openings.

4315. Where did it get out?—By the shafts to the roof of the building. At Saint Pierre the ventilation was chiefly effected by rather smallish openings, with gratings, above the windows. At the hospital of St. John the ventilation was defective. There are four small tubes, one at each corner of the large wards, for admitting air; they acted most imperfectly, and the outlets were also too small. This hospital exhibited an instance of defective ventilation which might, in my opinion, be very easily improved.

4316. Did you ascertain how those ventilating tubes in the military hospital terminated?—They terminated in the open air; they were covered.

4317. Did they never find the air, when the ward was very hot, come down those tubes?—It did not appear so. It was a wet day when we were there, and there was a difference in temperature between the air inside and outside. I think the ventilation was, considering everything, an extremely simple contrivance, and very effective; and afterwards I was informed that it was considered to be effective by the parties themselves.

4318. (*President.*) With regard to Vincennes, where there are large canals for the foul air, there is a shaft, as I understand you, running up to the top, there is a furnace at the bottom, and that shaft communicating with those large canals; will not the cold air come down when you heat it?—It is the law of tubes that if hot air goes up a centre tube the cold air has a tendency to flow down the sides. But take the case of the winter ventilation; you have two sets of tubes going up towards the top of the building, one is an inlet of air to the wards, and the other is an outlet by descending tubes to the ventilating shaft. In winter you have a fire under the shaft, and you have what corresponds to a fire in the up shaft, namely, a number of hot water vessels, and you have two columns of air communicating with the wards, each heated; and the amount of draught can only be represented by the difference between the temperature of the two columns, and the difference of length in the shafts; and if by any chance the fire should be allowed to go too low, so that the temperature in the inlet shaft was higher

Dr. John Sutherland.

than that of the outlet chimney, the current would go back in place of forwards.

4319. With regard to the water supply, how are the hospitals in Paris supplied?—The water supply in those hospitals is derived from the city supply. The supply of water in Paris may be said to be unlimited.

4320. (*Sir H. K. Storks.*) Is the water supply laid on?—Yes; but not in the sense in which we say in this country that water is laid on, that is, to each individual house or flat. The supply in Paris has only been recently improved. When I inquired into the subject in 1850, I found that one of the chief engineers had only one water tap laid on to his own house, and that was in the basement floor.

4321. (*President.*) When you say that the supply of water in the hospitals is unlimited, you mean as to quantity; but is that laid on to the different floors?—No, it is carried up in buckets, or pumped up; it is not laid on at pressure, as we have it in this country.

4322. It is not turned on in the same way?—No.

4323. (*Sir H. K. Storks.*) Have they tanks in any part of the hospitals?—They have tanks in some of the hospitals. At La Ribosière they have a steam engine and a pumping apparatus, and they have a small iron tank in each pavilion communicating with the flats below. We chiefly examined the basement flats, and there the water is laid on in taps; but I do not think it is generally done above, and the reason is that the basement flats are on the level of the water supply.

4324. (*Sir J. Clark.*) Are not the tanks meant for supplying the other wards?—Yes; the water is pumped up or carried up. I think at the Hotel Dieu the water is carried up, but I am not quite certain about it, or whether it is pumped up. With regard to the quality of the water, it is tolerably good; it is equal to our London water in quality, and there are means of filtration in use to purify it. If the means of distribution were adequate, the supply would be larger than we have.

4325. (*President.*) Does the same observation apply to Brussels?—They have also an unlimited supply, but I do not know how it is obtained.

4326. What is your opinion as to the state of the hospitals that you have visited with regard to cleanliness, compared with the English hospitals?—Many of our English hospitals are as clean as hands can make them, and in the same way, at Paris, you can find hospitals which are very clean. But I think in certain hospitals the staircases were not so clean as they might be. I would refer especially to the hospital of La Ribosière as a model of cleanliness. There are oak floors, as is usually the case in the Paris hospitals and dwellings; and these oak floors are waxed and are kept very clean and brightly polished. Speaking generally the wards themselves are very clean, and at La Ribosière they have adopted that which I consider to be one of the greatest improvements in hospital construction, namely, the use of impervious polished walls in place of porous plaster walls. This highly-polished surface answers the same sanitary purpose as those glazed brick walls which were introduced into Prince Albert's model cottage, erected at the Great Exhibition of 1851. It seems to be of Parian cement made in imitation of marble. In La Ribosière the ceiling of each ward is also formed of this polished cement.

4327. Will walls so covered bear washing?—Yes, that is one of the great advantages, that they can be washed most readily, and they do not absorb anything; they are almost entirely non-absorbing.

4328. Is that as good as the lime-washing of a plaster wall?—Lime-washing is most useful with porous plaster walls, when there is a reason for it, but the necessity would never happen with Parian cement. We had the evidence the other day of one of the officers of the London hospital, in which these Parian cement walls are in use, and they are considered there extremely valuable.

4329. Is it expensive?—I think it is.

4330. How was it at Brussels?—There the walls were plastered and lime-washed.

4331. Were the hospitals there equally clean?—I think they might be cleaner. They were not so clean as La Ribosière. The floors are of oak wood, but not polished.

4332. What is the system with regard to the latrines and drainage?—The latrines in almost every instance were most defective, and such as, I am glad to say, we have not in any hospitals in Great Britain, that I know of.

4333. Have they any water closets?—They have one or two water closets, in certain new wards, in Saint Louis, but they have been so defectively constructed that they will become a positive nuisance when much used. In Paris they have a system of street drainage, upon a very large scale. They have immense subterranean drains for the removal of surface water, but those drains, large as they are, remove none of the house soil. They do not permit the soil from any house or a hospital to pass into the sewer. The usual way of disposing of it is, to receive it into moveable barrels, or to construct under each house or hospital one or two cemented cesspools, completely closed in, except apertures for the admission of tubes from the latrines or water closets, an aperture to allow the surplus water to escape, and another aperture to allow the cesspool to be emptied, by a special machine which they have for that purpose; and the result is, that whenever you have open latrines and not water closets, which is the practice over the greater part of Paris, and in all the hospitals, you have an open tube communicating between the barrel or cesspool and the latrine. In the French model prisons they have endeavoured to get over these defects, and to prevent the escape of the emanations, by an ingenious but not quite an efficient process.

The matter from the latrine falls into a receptacle below, and the air from the cell is extracted down the opening of the latrine by means of a ventilating shaft, or it is forced down by a machine, as is the case at La Ribosière. But the objection to the plan is this, that the diffusive power of the noxious gases is very much greater than the velocity of the air current, and the result is, that however perfect the downward current may be, the smell of sulphuretted hydrogen and ammonia is sometimes very strong indeed.

Without making any sort of criticism upon the state of these places, it appears to me that the simple facts are enough to show what their sanitary effects on the inmates must be. At Brussels they have very much the same arrangement in the military hospital. It was not so clean as it might have been, and in the other two hospitals they have remedied the defects in some degree by very free ventilation of the latrine; still, under all the circumstances, those hospital arrangements are by no means so advanced as they ought to be, considering the great advancement in other sanitary arrangements which has been made. I need hardly state that the best-constructed water closets, along with very efficient ventilation, are alone admissible in hospitals.

4334. With regard to the cubical space, did you take any measurements?—Yes, in all the hospitals and barracks. There are regulations with regard to the cubic space, in hospitals and barracks belonging to the French army. In infantry barracks, the regulated cubic space is 444 cubic feet per man; in cavalry, it is 518 cubic feet. In wards in military hospitals, for wounded and fever cases, the cubic space per bed is 740 cubic feet. For venereal cases, it is 666 cubic feet per bed. There is also a regulation as to the cubic space, issued by the administration for civil hospitals; but, in every instance, we found that the actual amount of cubic space, in use, was very much greater than was required by the regulation. The mean cubic space, in the civil hospitals in Paris, is about 1,300 cubic feet per bed. At La Ribosière, it is about 1,800 cubic feet per bed. In the military

hospitals, the cubic space varied from upwards of 1,050 to as much as between 1,800 and 1,900 cubic feet.

4335. So that, in practice, they allowed much more space than the minimum quantity required by the regulations?—Yes.

4336. (*Sir J. Clark.*) Because they find it necessary, I suppose?—Yes; and I should state that this applies not to the number of sick, but to the number of beds; and even in those wards where there were no beds vacant, we found the amount of cubic space for the beds to vary from upwards of 1,000 cubic feet to very nearly 1,900 cubic feet. And I believe that this statement is under the mark. We had to measure some of the large wards by pacing, and we arrived at very nearly the same conclusion as to dimensions; but the cubic space now given is considerably less than the dimensions would give. Therefore, it is safe to say that the maximum is about 1,900 cubic feet.

4337. Do you apply that maximum to a bed, or to a patient?—To a bed.

4338. What was the size of the beds?—About 3 feet; and there were 32 beds in each ward at La Riboisière.

4339. How long was the bed?—About 6½ feet.

4340. (*Mr. J. R. Martin.*) Should you say that the average number of cubic feet, in these hospitals, would amount to about 1,500 feet?—Your question refers to a number of hospitals, in different parts of Paris, under very varying circumstances; but I think the true answer is, that it varies from one to the other, between the points I have mentioned, say 1,050 to 1,900 feet. The average of the three hospitals at Brussels is 1,500 cubic feet for each bed. In the French military hospitals they seem to have what might be called a reserve of beds. They have, in the Val de Grâce, two flats of beds in use, and they have the top flat under the sloping roof, which is not in use, but which can be brought into use; and they are making the same provision at Vincennes. In the largest pavilions they have three flats of beds to be used, and one flat of beds above to be held in reserve. And the operation of this, at Val de Grâce, is that while they have accommodation for between 1,400 and 1,500 sick, their actual number now is only about 1,000; not a single bed under the sloping roof is in use, for there is nothing there but the bedsteads; and it seems to be a part of their system to keep a reserve.

4341. (*President.*) What is the usual size of the wards?—The wards vary in size. La Riboisière has wards for 32 beds; Beaujon for 20 in each ward; Saint Antoine for 22; Vincennes for 40; Val de Grâce for 50 and 52.

4342. (*Sir J. Clark.*) Are there no small wards?—Yes; there are some small wards. There are wards at La Riboisière for two beds. That may be taken as one extreme. The other extreme is the large imperfectly-ventilated ward at La Charité, which holds 120 sick, and at Saint Louis there is a ward which holds 84 sick. At Vincennes there are wards for 40.

4343. (*Dr. A. Smith.*) Are there any serious cases treated in those large wards?—Yes.

4344. Do not they complain of the noise made by the great number of patients walking about?—I cannot say that there were many patients walking about, all the wards were very quiet and silent.

4345. (*President.*) Is the cubic space allowed greater or less at Brussels than at Paris?—The average is 1,500 feet for each bed. That includes three hospitals. Rather more than the Paris average.

4346. Is the distance between the beds greater at Brussels?—No; the distance between the beds is 2 feet 8 inches; 6 feet 8 inches from centre to centre, and 12 feet between the ends of the beds.

4347. Do they use curtains to the beds?—In many of the French hospitals they have iron pillars to the bedsteads and white chintz curtains. At La Riboisière they have white gauze curtains to each window, and it is the general habit in French hospitals to use

curtains; but they have none in the military hospitals.

4348. You have mentioned already the composition of the walls?—Yes.

4349. And of the floors?—They are of waxed and polished oak uniformly; and in a hospital heated by artificial means there is an iron plate that runs along the whole length of the ward, and underneath that are placed the air tubes and warming tubes. A larger or smaller number of stoves placed down the centre of the ward is the usual method of warming where there is no separate system of heating and ventilating.

4350. What are the staircases made of?—They are sometimes of stone and sometimes of wood.

4351. What should you say was the general sanitary condition of those hospitals?—I consider the sanitary state of the hospitals to be excellent as regards construction, lighting, means of natural ventilation and cleanliness; but as to the latrines and the water supply, I think there is room for great improvement.

4352. (*Sir J. Clark.*) You would say generally that the sanitary state of the hospitals is good?—Yes, using the word “good” in a relative rather than in an absolute sense. In some particulars it would be very difficult to surpass certain Paris hospitals in sanitary construction, but in matters connected with the habits of the people, such as the latrines, they are defective, although either by the position or by the ventilation of the latrines their defective sanitary construction has to some extent been compensated.

4353. (*President.*) Did you make inquiries into the nature of the medical education for the army?—Yes, we made very minute private inquiries and obtained information from the best sources. What we have to lay before the Commission is partly of a documentary character, but I may state that at Val de Grâce there is a special military medical school. That school contains a museum of natural history and of anatomical preparations. There is also attached to it a botanic garden, a good library and reading room, and it has four lecture rooms. And there are seven professors and seven agrégés appointed for the practical instruction of the pupils; distinguishing practical instruction from purely scientific instruction. I should say that the education given is a practical education. This is the last published affiche of the school, and shows the course of instruction (*handing in the same. See Appendix No. V.*) Every man who enters into the army medical service must have the French degree of doctor of medicine. Having obtained this, he is admitted to the military medical school after an examination. There he has to pass an average time, say, of about 12 months, and that contains two four-month courses of instruction. The points which are brought under his notice are also mentioned in the affiche. He has to submit to four examinations by the professors during that period, and lastly to one final examination by a board of examiners, not connected with the school, before he is admitted to serve. I shall speak generally of what we learned as to the nature of the instruction, and shall lay before you a digest of the kind of information that is given, and the kind of training that is required. If the practical results of that training at all come up to the programme, the men who enter into the French army medical department must be very superior men indeed. The following are the objects of instruction:—First, a course of clinical medicine, which lasts the whole year; then a course of clinical surgery, which lasts the whole year.

4354. (*Sir J. Clark.*) Both in the same year?—Yes. Then there is a course on venereal diseases which lasts the winter, and a course on cutaneous diseases, which lasts the spring. There is a four months' course of lectures and instructions from the 15th of January to the 15th of May, and in this course are comprehended anatomy and practical chemistry, as applied to special subjects which come under the observation of military medical officers. I inquired whether the medical officers ever had to perform chemical analyses, and I was told very frequently indeed. There are lectures upon army epidemics, and on

*Dr. John
Sutherland.*

Dr. John
Sutherland.

15 June 1857.

the subject of diagnosis with its practice, and also on the application of bandages and surgical apparatus.

4355. (*Mr. J. R. Martin.*) The whole of this instruction which you describe is something over and above and super-added to the education necessary for qualifying a man to practise in civil life?—Yes; a man must pass out of the civil school fully competent for civil practice before this takes place. In the second four months, from the 20th of May, to the 20th of September following, the course is practical chemistry of the same kind, and then military hygiene and military medical jurisprudence—then operative medicine, which includes the practical parts of medicine, and then the application of bandages and apparatus. There are professors who give lectures and instructions upon all these points. There is no collection of models of hospitals, barracks, ambulances, &c. at Val de Grâce, but there are models in almost all the hospitals and public institutions where the students are taken to become acquainted with them, and to compare their construction. A professor takes his pupil to teach him perhaps at a distance from the hospital or in some other establishment,—as, for instance, he is shown the merits of different systems of ventilation, or the methods for purifying water. He is taught wine tasting, and he can only acquire that art at one public institution in Paris, and he is taken there, and taught it.

The following is a digest of the programme :—

The instruction in *clinical medicine* comprehends examination of the patient, diagnosis, indications, treatment, a detail of cases, ascertaining the extent and nature of organic changes, résumé of the actual state of the patient, etiology, comparative diagnosis, the discussion of all these subjects *vivâ voce*, the use of the diet table, the art of prescription under the professor; lastly, post-mortem examinations, and pathology.

Instruction in *clinical surgery* comprehends the more usual surgical injuries, and diseases incident to soldiers, with the diagnosis, prognosis, and terminations, the etiology and treatment. This instruction is also given under the professor, who discusses in the operating room the nature of the disease, the form of operation, the possible accidents, and necessary precautions, as well as the subsequent treatment. In the course of eight months of the year there are 30 practical lessons, specially given on wounds and injuries incident to war.

Particular stress is laid on the teaching of *regional anatomy*, as being of all methods the most interesting and practically useful for the military surgeon.

Three practical lessons are given on the anatomy of the cranium, 12 on the face, 6 on the neck, 6 on the chest, 5 on the abdomen, 4 on the pelvis, 8 on the inferior members, and 8 on the superior members.

The course of *chemistry applied to hygiene and to army purposes*, comprehends the analysis of the qualities of food and medicine, and the recognition of poisonous substances; the discovery of adulteration; the chemical history of atmospheric air, water, starch, farinaceous substances, bread, wine, &c., their natural condition, preparation, composition, physical and chemical properties, distinctive characters, alterations they may undergo, frauds, and the uses of various substances, particularly as regards hygiene.

The pharmaceutical pupils are required to work every day, and the medical pupil two days a week in the laboratory, under the constant direction of the professor or the agrégé, in order that the one may become acquainted with the most delicate chemical operations, and the other with the most important applications of chemistry to garrison and field purposes.

The course comprehends 60 practical lessons, including re-agents, metalloids, waters from all sources, with their distinctive characters, and the means of purifying them spontaneously, by filtration or disinfection; mineral waters, filtering apparatus, distillation; methods of freezing, and of chemical purification; the nature and properties of atmospheric air and of

noxious gases, with their analysis; the physical construction of the atmosphere, its alteration by emanations from bodies in combustion, living animals, marshes, lakes, organic matter, &c. Charcoal, with its uses for purification, filtration, heating, &c.; the analysis and recognition of various gases; iodine, phosphorus, arsenic, poisons, their action on the human organism, and the means of detecting them; acids, oxydes, and mineral salts, their recognition, analysis, action on the animal economy, treatment, the recognition of a given poisonous substance, organic acids, organic alkalies; inquiries into these for similar purposes: to discover a given organic alkali; the composition chemical and microscopic of blood; the characters and composition of milk, cream, cheese, butter, with the various substances used for their falsification; the physical and chemical properties of urine, with the chemical and microscopic changes it undergoes in disease or from poisons; urinary calculi and the character and composition of bile.

Operative surgery is taught in 53 practical lessons, which comprehend all or nearly all surgical operations, and there are besides 12 practical lessons given in bandages, surgical apparatus, and the reduction and retention of luxations.

The course of instruction on *military hygiene and medical jurisprudence* is given in 51 practical lessons, and 15 practical exercises. It comprehends the special causes of disease and mortality in the army; aptitude for service; recruiting, regulations, exemptions; simulated and concealed diseases, with the methods of discovering them; voluntary mutilations; circumstances attending the formation of contingents; the departure and arrival of recruits; inspections, registers; moral and physical influences acting on the recruit; home sickness; functions of the skin as affected by age, sickness, climates, &c.; clothing, clothing materials, their properties, hygrometric, calorific, electric; emanations proceeding from them; chemical and microscopic verification of the purity of the materials; the influence of military clothing and equipments on health; the hygiene of military clothing, with relation to seasons, climates, day, night, epidemics, &c.; preparation, qualities, and verification of leather for shoes; effect of diet on the system; the nourishing power of different substances; flesh of animals; diseases of these animals, with their effect on health; the means of recognizing disease in animals destined to supply a camp; characters of good meat for camp and hospital purposes; vegetable aliments, chemical composition, qualities; methods of baking; qualities of bread and biscuit; the preparation and preservation of alimentary substances for troops in the field; effects of the use of salted and smoked flesh; the ration, and the circumstances which require it to be varied; drinks, water, its characters according to origin, composition, temperature, &c.; means of ascertaining the qualities of water while on march; means of preserving drinking water; influence of certain water in the production of disease, and the means of purifying water on march; spirituous liquors and their abuse; fraudulent adulterations; surveillance of regimental canteens by medical officers; the hygienic use of spirituous liquors, and exercises in tasting them; milk, its uses and the appreciation of its qualities by taste; condiments; sanitary condition as relates to bivouacs, tents, huts, barracks, camps, ambulances; rules to follow in the choice of proper positions for camps; the salubrity of camps, its importance, means of securing it; usual causes of the insalubrity of camps; rules to follow in the position and construction of hospitals, barracks, guard-rooms, casemates, &c. Causes of impurity of the air in different permanent military buildings, with the means of remedying them; cubic space allowed to soldiers in barracks and hospitals; ventilation and its modes; parallel between existing systems of ventilation, fumigation, the effect of stagnant waters, canals, rivers, lakes, forests, cemeteries, the sea, &c.; sanitary precautions to be taken by troops while draining marshes, or constructing works in marshy localities; sanitary

precautions for latrines; special rules in the formation of a regimental infirmary or hospital in the field; on exercise, its general and local effects; military gymnastics and their influence on the superiority of French troops to those of other European nations; the professional exercises of the soldier, riding, marching, arms, &c.; hygienic rules, governing muscular action; cleanliness, its effect on the health of the soldier; baths and ablutions, their sanitary use; the doctrine of climates, their physiological and pathological influence on the human organism; acclimatization; precautions to be taken when troops are changing climate; morbid effects of change of climate, and the sanitary use of climatic influence; the soil, its structure and configuration; principles of medical topography and statistics, etiology, and prophylaxy of epidemic diseases, quarantine, poisoning, real and feigned, succour and antidotes; detection of poisons; tobacco, its preparation and qualities, its use and abuse in the army; morbid states, simulating death, succour to be given in asphyxia with the means and instruments for recovering the patient; signs of apparent and real death, with the precautions to be taken as to them in hospitals, battle-fields, and military executions; different means of sepulture, and the best methods during war and epidemics; signs of suicide and homicide; character of burns and wounds made during life and after death; various forms of certificates; injuries and infirmities which authorize retirement; various forms of reports and registers; the rights and responsibilities of military medical officers.

Practical exercises in military hygiene comprehend the choice of men for service; visit to the hospital of Bicêtre to study the different forms of mental alienation; inspection of a tannery; inspection of a caserne as to the accommodation for soldiers and horses, kitchens, ambulances, &c.; visit to the hospital La Ribouisière to compare the two systems of warming and ventilation; inspection of the prison Mazas; inspection of the preparation of flour, bread, and biscuit; of a baking establishment, and one for preserving vegetables; visit to a brewery; visit to the establishment on the Quai de Celestins to see the clarification and purification of water and the process of filtration at the Caserne Napoleon; the tasting of alimentary substances in use at Val de Grâce; visit to the school of military gymnastics; inspection of the manufactory of tobacco; visit to the veterinary school at Alfort; exercises in tasting wine, beer, eau de vie, absinthe; medico-legal autopsies.

There is another very important series of instructions in *military hygiene*, namely, *on the diseases and epidemics of armies* chiefly arranged according to their hygienic classification. There are 49 practical lessons given on this subject. They comprehend the diseases of seasons; the diseases of climates; the diseases peculiar to telluric conditions,—such as the nature of the soil, defective natural drainage, bad irrigation, the culture of virgin soils, marsh diseases, hereditary diseases, diseases depending upon the quality and quantity of food, the study of epidemic and endemic attacks, the effects of the military profession and camp life in predisposing to these diseases, and practical illustrations drawn from particular epidemics.

The course on *diagnosis and pathological anatomy* is comprehended in 35 lessons, and special attention is given to the pathology of army diseases.

There are 63 lessons given on *military pharmacy* and “*comptabilité*.” These comprehend the pharmaceutical materials required in garrison and in the field; regulations as to poisonous medicines; the providing of medicines; collection of plants for medical purposes in distant places, and their preparation; hospital formularies; extemporaneous preparations; official preparations, materia medica, animal and vegetable; the study of the various classes of medicinal plants; and the method of keeping the accounts of materials and quantities with the necessary reports.

4356. (*Dr. A. Smith.*) Did you obtain any opinions in reference to the advantage of that practice from

any others but those who were concerned in giving the lectures?—From no other persons.

4357. Not from any of the inspector-generals, or members of the council of health?—No; the council of health consists of seven inspectors, and the school is under one of them.

4358. You did not take their opinion as to the effect of that practice?—I did not, for obvious reasons, but it was easy to learn from conversation that the system was considered excellent.

4359. (*President.*) The distinction, I think, is, that the French Government undertake to educate the medical officer, whereas we trust to the open market for it?—Yes; the French Government undertakes the special education of the military medical officer, not his education for a degree, except under special circumstances. For instance, I think I am right in saying that if there are medical students who have displayed peculiar aptitude for their work, the Government sometimes passes them into the school of medicine, and furnishes them with the necessary inscriptions to obtain their degree, and afterwards they can enter the Imperial Military Medical School if found fit, and the Government pays the whole expense of this school.

4360. How do they secure that, when this good education has been given to the students, they will not leave the army service?—Practically they do not leave. They prefer remaining in the army, and I understand that, practically, men who enter, like the army. In the case of medical students specially educated, they come under an obligation to serve 10 years.

4361. (*Sir H. K. Storks.*) There is no want of medical candidates for the army, is there?—It appears not.

4362. (*President.*) Is there any other point that you wish to allude to?—I should wish to be asked about barracks.

4363. Did you examine into the barracks in Paris?—Yes; I examined with my colleagues the Caserne Napoleon, which is the latest constructed, and considered the best.

4364. Is it a well constructed barrack?—Yes; the Caserne Napoleon consists of a large square of building, the barrack rooms in which go from one side to the other, straight through. They have windows opening, consequently, into the street outside and into the court inside. The barrack-rooms are of two dimensions, one is half the size of the other, and in the smaller room the ranges of beds extend each way from back to front of the building, that is, across it. In the double room there are four rows of beds, two along a bulk-head which divides the large room into two parts.

4365. (*Sir J. Clark.*) Does the division go to the top?—No; it is a partial division of the ward, it is a rail. Then the beds are very close together, from 8 to 12 inches from side to side. The bedsteads are of iron, and the rooms are ventilated by small openings near the ceiling; I think four upon each side, which communicate with a shaft, and so go to the top of the building. They are small circular openings much too small, but when we were there all the windows were open, the rooms were nearly empty, and the ventilation was good. The cubic space allowed is much larger than the regulation (444 cubic feet). It is about 800 cubic feet a man, but the cubic space is chiefly above the bed, on account of the beds being so close together. Epidemic diseases are received at Val de Grâce from the barracks of Paris, showing that these diseases appear in barracks.

4366. (*Sir H. K. Storks.*) Are there shelves and pegs for the men to hang their things on?—Yes. This barrack has the usual army latrine in the basement, merely a few openings. The one we saw was very offensive. The water supply is on the basement.

4367. What means of ablution have the men?—There are stone troughs at the foot of the great staircases, which on each side of the square afford the means of communication with the barrack rooms, and

Dr. John Sutherland.

15 June 1837.

*Dr. John
Sutherland.*

15 June 1857.

over each trough are a greater or smaller number of water taps. The water is specially filtered and is constantly on. It is Seine water. The men wash and draw water at these taps. We saw them washing clothes in a trough in a corner of the court.

4368. What kind of kitchens have they?—The kitchen is a rough military kitchen, not at all up to the hospital kitchens. I may state generally their construction. The hospital kitchen is generally a large, lofty, well-lighted, square apartment, in one or two instances having walls and ceiling of polished parian cement. There is a square cooking apparatus in the centre of the floor, constructed most frequently of iron, with polished brass or copper mountings, but sometimes of brick. This apparatus contains large boilers, and has compartments for baking or roasting, and the whole is so constructed as to save fuel. The kitchen arrangements in the hospitals generally are extremely good, clean, and quite sufficient. They are not so complete, or by any means so clean and good, in the barracks.

4369. (*Sir J. Clark.*) How many kitchens have they in La Riboisière?—One; placed in one corner.

The witness withdrew.

*Dr. Henry
Mapleton.*

Dr. HENRY MAPLETON, 15th Hussars, examined.

4375. (*President.*) You have heard the evidence of Dr. Sutherland, and the description he has given; do you agree with him generally, or is there anything you wish to add?—I agree in the abstract with the description of what Dr. Sutherland saw; but, as the Commission may come to a conclusion as to the best mode of constructing and ventilating hospitals from that description, I think I had better offer a few remarks on the size of the wards and position of the windows in the French hospitals. We found wards capable of holding 30, 40, 50, even 100 patients, with opposite windows, and the beds placed between them; and many persons in England suppose that the large size of the wards, and the situation of the windows, are for what is called a cross ventilation, so that by this arrangement foul air will pass out at an opposite window without diffusion. The ventilation in some of the French hospitals is carried on by artificial means; there are no open fire-places, and the cross windows in these hospitals are not for ventilation, but as far as I could make out were chiefly for light; and even that was so strong that it had to be subdued in the civil hospitals by curtains. In the large hospitals, where an artificial system of pumping in, or extracting out was in operation, positive orders were given that none of the windows should be open day or night. In those hospitals where there was no pumping in or extracting, but where the air was heated by a stove in the room, no cross ventilation could take place; for if a window or door was opened to supply air, that air, being cold, would rush to the part where the vacuum was formed by the stove, and not pass in a straight line through the ward to the opposite window. I was informed by military and medical authorities, that the rooms were of such large dimensions for facility of administration, and for economy. I asked those gentlemen if they thought that small wards would be better for the comfort, &c., of the patients than the large ones; and they said, if it could be carried out, 10 or 12 men would be a better number than 40. I asked the soldiers themselves, and they said the same. I visited the wards at La Riboisière at night, between 10 and 11; and I found in two of them patients very ill, moaning, and disturbing the rest. Therefore, I conclude from what I observed myself, and from what I heard from others, that the block construction was preferred, because it admitted of facility of administration in having large wards; that the opposite windows were not intended so much for ventilation as for light, and that the heating of the air by stoves, &c., suited the habits of the people,

4370. Have they any small kitchens for preparing comforts attached to the wards?—On each flat, at La Riboisière, there is a small kitchen in which they can cook any small thing; practically things are cooked in the large kitchen, and the diets are all carried; they have no lifts.

4371. (*Dr. A. Smith.*) Must not the men be very apt to catch cold if the washing places are at the bottom of the staircases?—It would be an improvement to have the lavatories elsewhere. I do not consider them by any means perfect.

4372. Does not that cause a great accumulation of filth and dirty water?—It may; but when we inspected these lavatory arrangements, the troughs were clean.

4373. (*Sir J. Clark.*) How many men does the Caserne Napoleon hold?—It is intended for 3,000.

4374. (*Sir H. K. Storks.*) Have they any covered parade grounds?—I do not recollect having seen any. There is a corridor round the whole court at the Caserne Napoleon; but the men were being paraded in the open court. There is a covered gymnastic court at the Petit Chateau at Brussels.

and the finances of the country. I was told by high authority that the most approved system of ventilation and mode of construction as regards wards, &c. &c., was to be seen in the new military hospital, nearly finished, at Vincennes, in which the ventilation is to be carried on by artificial means; and the wards are large with cross windows, and the space between the wings is 300 feet. The construction is for economy.

4376. (*Sir H. K. Storks.*) And for facility of administration?—Yes.

4377. (*President.*) Though the light might be too great when you saw the hospital, it would not be so great in winter?—A Frenchman is accustomed to much light. An Englishman would, I think, complain of the same amount. Many of the patients told me that the light of the opposite window annoyed them, and the French officers said the same; they said there was too much light for some patients.

4378. In the construction of almost any hospital, must not somebody be opposite to the light?—No, that is a great principle that is being considered at this moment. The objection to Netley by various physicians and medical men is, that there are no opposite windows between each bed, that is to say that the windows are placed at the end of the rooms instead of at the sides, by which latter construction the air would pass from the windward window right through the leeward one, taking each man's foul air from him in that manner; and that is one reason why it has been said that the French construction of the wards is so much superior to ours.

4379. (*President.*) But do the English physicians who advocate that principle advocate it for sanitary purposes?—Yes. They say that the French have found by experience that this cross ventilation is superior to anything else.

4380. Have they not found that in the civil hospitals in London?—I do not know of any hospitals in London where the experiments have been made to the same extent. They have in Paris with this mode of construction artificial ventilation by pumping in air and extracting it. In England we have an extracting shaft, which is an open fire-place, and which will derange all such artificial systems. Therefore we shall certainly fail, not only in getting pure air into the wards, but in drawing foul air out of them, if we are to depend for our ventilation on any such artificial means as are in use on the continent.

4381. Does that remark apply to any large system of artificial ventilation that you know of?—Yes;

when a ward does not depend upon itself for ventilation, and where there is one great central extracting shaft communicating with every ward, I think it will be attended with great danger, inasmuch as the English open fire is very likely to cause a back current of foul air to the ward should the doors and windows be shut, and there are no other means of supplying the demand for the fire. I think that every ward room should depend upon the means given to it for its own proper ventilation, such as an open fire-place, shafts in the ceiling to the chimney for extraction, and minute orifices all round the skirting for the admission of fresh air, &c., &c., which I think is all that is necessary to have complete ventilation.

4382. (*Sir H. K. Storks.*) And open windows?—Yes.

4383. (*Mr. J. R. Martin.*) Your impression is, that natural ventilation is that which ought to be relied on?—Entirely; but by natural I mean more than simply doors and windows as above stated.

4384. (*President.*) Only you would not carry natural ventilation so far as to have windows on both sides?—I think that is not necessary in all cases, as it must depend upon the size of the wards.

4385. Do you think you can get enough natural ventilation without that?—Yes; the wards in the Brussels military hospitals had not all cross ventilation; they chiefly depended for ventilation upon the atmosphere coming in through apertures and simple shafts for taking it out; but that cannot be carried out with our open fires, for as soon as they are lighted and the windows and doors closed, the air will be drawn down the shaft. In several of the barracks in England where there are apertures in the ceilings, I have seen the soldiers stop them up, because when the fire is lighted the draught is so strong as almost to blow out a candle.

4386. Do you approve of hollow rafters communicating with the air on each side of the roof cut off in the centre so as to admit the fresh air from windward and the foul air escaping to leeward?—I have never seen that in operation; but I would not trust to the windward for the admission of fresh air, or to the leeward for the escape of the foul. I think that an open fire-place with a draught up it, and tubes connected with the chimney for the purpose of extracting the foul air from the centre of the room is all that you require, as regards extraction of the foul air of a room, in addition to doors and windows, &c.

4387. Have you seen the system of ventilation in use in any of the prisons?—I have seen Colonel Jebb's plan at Pentonville; but I have no practical knowledge of its working.

4388. (*Sir James Clark.*) Would you warm the air that you admit in the winter?—No; most people condemn that for soldiers.

4389. Would you have no warmed air in the hospital?—My opinion is unfavourable to it.

4390. (*Dr. A. Smith.*) In the large ward at Fort Pitt, how are the windows placed?—I forget.

4391. Do you recollect that great complaints were made in consequence of the patients catching cold from the windows being opposite each other, and often opened on the opposite side?—No; but in the Paris hospitals the patients told me, and the Director of La Riboisière also told me, that it was necessary to have curtains, the draught being so great at times from the pumping in of the air, without the windows being opened at all. When we got to Paris we found at La Riboisière, at Beaujon, and at the new military hospital at Vincennes, that instead of the windows being used as a means of cross ventilation, which is said to be the cause of the superiority of these hospitals, they could not be opened, as it would interfere with the artificial system of ventilation.

4392. (*President.*) If you had the management of the Paris hospitals, would you not do away with the artificial ventilation, and open the windows?—If I had the management of the Paris hospitals and had the means, I would do as an authority on the construction of barracks and hospitals said he would do

if he had the means, and I would do as some of the doctors said they would do if they had the means, and as the private soldiers said they wished to have done, namely, to have open fire-places and small rooms to contain ten or twelve men, with windows in any good position; for where the system of ventilation is such that you depend upon pumping in and extracting for fresh air, it does not matter whether the sides of the wards are windows or brick walls.

4393. (*Sir H. K. Storks.*) I suppose that the windows in the Paris hospitals could be opened without injury to the patients?—Certainly not, except in summer time. I think that if windows between the beds were opened in winter, it would be very injurious to the patients that are near them.

4394. (*President.*) What you object to is, not to their having these lateral windows, but their not using them?—A Frenchman half the year lives in the light under the trees, and he likes the light when he is in hospital. In summer these lateral windows may be opened with impunity; but in the six or eight winter months it would be injurious in my opinion. I have also great objections to such large wards, for this reason, that a very serious or dying case placed among so many others disturbs all the rest.

4395. (*Mr. J. R. Martin.*) Would not that grievance be very much enhanced by a ward being small?—I think quite the contrary. If you have a small ward with ten men, and one man is dying, nine men will be disturbed; but if a man is dying in a ward containing 40, you disturb 39 men.

4396. (*President.*) But the question of the size of a ward is one surely which stands on quite different grounds from the question as to the position of the windows?—I think the position of the windows must depend upon the size of the wards. If you have small wards for 10 or 16, you cannot have the construction of the Paris hospitals. If you require accommodation for any large number of sick, say 500, in such a case, if you had small wards, and of the French construction, the numerous blocks would be spread over such a space of ground that everything necessary for the administration of the hospital, such as, the kitchens, dispensary, stores, &c., would be at too great a distance from the wards.

4397. (*Mr. J. R. Martin.*) Do you not think that the difficulty of good ventilation increases in proportion to the smallness of the apartment, and that a large ward is more easily and equably ventilated than a small one?—I think that a small ward for two is far more easily ventilated than one double the size would be for four. If you have one or two bad cases among 40 people in one ward, the foul air is diffused so rapidly that the whole 40 people will have a hospital atmosphere within that ward. That I observed myself in Paris; none of the wards that I saw were sweet; and I think that our own hospitals, if each patient was allowed the same amount of space with the means of changing the atmosphere, would be more sweet. I consider all the hospitals in Paris to have the peculiar odour of a hospital atmosphere. I do not think so highly of their systems of artificial ventilation, or their mode of construction, as some others do; taking into consideration the peculiarities of the Englishman's habits and climate.

4398. (*President.*) Your observations as to the mode of construction do not apply, when they do not make use of it?—My observation refers to those who approve of their systems of ventilation, and mode of construction of hospitals.

4399. You think that a thorough draught does not make a better ventilation than any other kind of draught?—I believe that the reason why physicians and others in this country say that the French system of construction of hospitals is better than ours is because that system admits of a cross ventilation, which in my opinion is not carried out; therefore, they come to conclusions upon false data. In the winter, in all the Paris hospitals, whether ventilated by artificial means, or whether the air is simply heated by stoves, the air that comes in does not come through

*Dr. Henry
Mapleton.*

15 June 1857.

*Dr. Henry
Mapleton.*

15 June 1857.

the windows at all times, nor are the cross windows always used for ventilation, for in all the wards which were ventilated by machinery, as at La Riboisière, one pavilion at Beaujon, and the new military hospital at Vincennes, the windows are ordered to be kept shut.

4400. (*Sir H. K. Storks.*) Do not you consider that light is essential to the recovery of the sick?—Certainly; but not too much.

4401. (*President.*) Are not the sun's rays useful?—Yes; but the sun's rays may be too powerful, and prove a source of annoyance, even of injury to patients.

4402. (*Sir H. K. Storks.*) Is not a hospital better with plenty of light in it, than to be very dark?—No doubt; but you may have too much light as well as too little. If cross windows (with beds placed between them) are to be depended upon for ventilation, the patients near those windows in the winter season might be seriously injured by their being opened.

4403. (*President.*) The changes made at Netley will then be very injurious, by which there will be a thorough draught through each ward?—No; for the windows are placed at the ends, and not at the sides.

4404. You have equally got there cross light from the windows?—No; it is lengthwise. What I understand by cross light is, having windows between the beds; that is in opposition to length light; at Netley the windows are length light.

4405. But they are at both ends?—Yes.

4406. Therefore, so far as there being too much light, or admitting too much sun, that mode of construction would be defective?—No. A man lies opposite a wall, and he is not so much annoyed by the light, as if he lay opposite a window.

4407. Did you ascertain, when you were at Paris, the rate of mortality, or the sickness in the French army?—The return has been asked for.

4408. Would it include the nature of the diseases?—Yes.

4409. Did you inquire into the scale of diets in the hospitals?—Yes; and they will be laid before the Commission.

4410. Can you state generally what they are, as compared with the diets in our hospitals?—The scale is laid down, and the authorities consider that that scale includes everything requisite.

4411. Did you see the arrangements for cooking in the hospitals?—Yes, we saw the kitchens.

4412. Are they better or worse than ours?—I think some of ours are as good.

4413. Have they the means of baking?—Yes, they have a scale of diet, and they have the means of cooking it accordingly.

4414. They can do more than boil?—Yes; and I believe by our regulations here, all hospital kitchens will be fitted up with an oven; about three years ago, I think, I first heard that this was determined upon.

4415. Has this been done?—I do not know. In many hospitals where I have been stationed, we had an oven in the range.

4416. Did you see the kitchens in the Paris hospitals?—Yes.

4417. Are they about the same as ours?—Much the same. The French soldier in barracks gets nothing but beef, bread, soup, and vegetables—and these are cooked in their kitchens.

4418. Are they much the same as ours?—The diet of our men in barracks is more varied than theirs. The French soldier has soup and beef for breakfast, and the same for dinner with bread and vegetables.

4419. Are the means of cooking the same with them as with us?—They have large coppers, in which they boil just the same.

4420. Do the men complain of it?—They informed me that their diet was not varied sufficiently, and they complained of it.

4421. Did you ever know of our men complaining of want of variety?—I do not know that I have. In

the regiments I have served in, they have generally had baked meat Sundays and Thursdays, at least such is my impression.

4422. (*Sir H. K. Storks.*) But was not that in India?—No, last winter at Dorchester, in the 15th Hussars. The meat was sent to a bakehouse in the town. I do not mean that it was baked in the barracks.

4423. How is the baking paid for?—I think the men paid for it by losing the vegetables on that day.

4424. (*President.*) Should you not say that that is very unfair with regard to the soldier?—No doubt of it.

4425. Would it not be much cheaper done if the public were to construct ovens for them?—It would be cheaper to the soldier certainly, as he has to pay for having it done now in some way or other.

4426. How were those hospitals supplied in France, by what department, and what course is taken when a new hospital is to be built?—The engineer officer provides the building, and the Intendant everything within it. If a hospital is to be built a medical officer is put upon the board; they do not necessarily adopt his opinion, but he is there to give it. The engineer generally, after the plans are submitted to him, lays them before the Minister-of-War and he gives the orders. As to repairs or for hospital damages, the soldier pays as in our army, if wilfully done.

4427. There is nobody attached to each barrack to look after the repairs of it?—The engineer department does everything that is required. There is no barrack-master, nor clerk of the works. The engineer officers do all that in France themselves, and they assess the damages; but the soldiers or officers can appeal against them, I believe.

4428. Do you know whether such things as small repairs are much delayed in consequence of that system?—I think not.

4429. Have they fewer forms to go through?—I suspect that their forms are more simple than ours; but it must be taken into consideration that in France there is a different form of government; there are no returns called for by the House of Commons, as with us; there is no one to dispute the orders of the war minister, nor individual members of the House of Commons to call the minister of war to account for the expenditure in the way that ours do.

4430. (*Sir H. K. Storks.*) Do the men in a French barrack eat in the same room in which they sleep?—They eat in their barrack room upon their beds or any where.

4431. Is the French bedding better than the English?—The French bedding in barrack and hospital is better, they have two mattresses, one of straw underneath, and one above of flock; they have a pillow and a pair of sheets, and a white blanket, and the sheets are changed in the hospital as often as necessary and in the barracks once in 20 days. No man in a barrack sleeps in another man's bed, if a man goes on guard, the sheets are taken away and a clean pair is given; the beds are not turned up. The men can smoke, and they can sleep in the day time in their rooms. Their arms are kept very much as ours are, they are in four different places.

4432. Is there any stoppage made for the hospital?—When a French soldier is in hospital, his pay is stopped altogether.

4433. Who supplies them with fuel and light?—The intendance supplies them with fuel and light according to the number of rooms.

4434. Who supplies the ration?—That is supplied also by the Intendant.

4435. Therefore there is one department which supplies everything except the repair of the building?—Yes; the Intendant supplies utensils, bedding, food, and fuel; the engineer supplies the building and keeps it in repair.

4436. Are they well supplied with regard to the utensils, such as drinking cups and things of that sort?—The utensils are good and ample.

4437. Any chamber utensils?—Not in the barracks. An earthenware one to each bed in the hospitals.

4438. Was there any urinal?—In barracks, the soldier goes down below to the urinal, which is placed at the bottom of the staircase.

4439. Not in the ward?—No, not in the barrack room.

4440. (*Dr. A. Smith.*) When additional stores are required do they report the same, or how are they obtained?—In the civil hospital there was a linen store, and a store for dirty things, but the medical officers had nothing to do with that; that was under the director, or governor of the hospital.

4441. I spoke of a military hospital?—There is a large store there.

4442. Can that store be got at at any moment? Could they provide from that store anything that was wanted?—I understood that they could provide at any moment for any number of patients the hospital could hold.

4443. Without having to send to any general store at a distance?—Yes; I understood so.

4444. (*President.*) Did each hospital have its own store?—I understood so. If they had 600 sick, they had a complement for 600 sick with the supply of bedding that was necessary, and a change.

4445. Resembling the naval hospitals in this country?—Yes, much the same thing, I believe.

4446. What is the division of the duties in a hospital as between the intendants and the medical officers, do they take any part in the management of a hospital?—There are three elements in a French hospital: first, the treasurer of the sick, then the administrative element, then the persons who carry out the orders of the other two. The administrative element consists of the intendant and comptable, is a branch of itself, and essentially composed of military men. The comptable is the resident governor of a military hospital, and is an officer who has risen from the ranks. The intendant is also a military officer, and must have been of the rank of captain before entering this branch of the service.

4447. Is he under the comptable?—The comptable is under him.

4448. He is more a house steward of the hospital, is he not?—He is the governor, the doctor merely treats his patient.

4449. But he can do nothing except under the direction of the intendant?—Nothing.

4450. The intendants are the governors of the hospital, are they not?—Yes, but the relative position of the comptable and the surgeon is, that the comptable is the governor in the absence of the intendant. He resides in the hospital.

4451. Is it not more like a London civil hospital, where the house steward is the administrator of the hospital, and there is a committee of governors over the whole?—He holds a higher position, I think, than the house steward in a London civil hospital; he is supposed to be superior to the medical authority, which I do not think a house steward in a London civil hospital is.

4452. The evil of the system, as I understand it, is that they have a veto to a great extent upon the treatment of the patient?—All the evidence that I could collect is contrary to that, as far as I could understand from the surgeons themselves, their orders for the treatment of the sick were supreme—confining themselves generally to the scale of diets as laid down, and which is carried on in the same way in civil hospitals.

The French have laid down a scale of diets in all their hospitals, and therefore all that the doctor can do (unless in very extraordinary cases) is to confine himself to that scale; he can only alter it by giving half portions of one and quarter portions of another, and so on.

4453. (*Sir H. K. Storks.*) Suppose the medical officer considers it necessary to give a patient a certain article which the intendant has not got, can he compel the intendant to procure it?—If it were a

case of life and death I was told that he could, but that in ordinary cases he could not.

4454. (*President.*) Did you not hear that the intendant had too much authority in these matters?—I heard complaints from the medical officers that they wished to be independent of the intendant, as if he disputed the orders of the medical officer, as regards the sick, their only appeal was to the Minister of War—and that this was a lengthened course.

4455. Practically have not the reports with regard to the character and efficiency of the medical officers been sent through the intendants to the Minister of War?—As far as regards the reports made of medical officers, I heard that they were inspected by an inspector from Paris, only once a year; and that if at any time a colonel of a regiment had reason to find fault with his medical officer, he reported that officer to the general of division; but that in a general hospital it was the duty of the comptable, under such circumstances, to report to the intendant, and the intendant to the general of division, or Minister of War.

4456. If it be true that the medical officers are very much dependent upon the intendants for their prospects in their profession, are they likely to make reports against the intendants?—I do not think that they are dependent upon the intendants as to their advancement. There are certain rules laid down in the French army; at the first step two-thirds of the promotions are by seniority, and one third by selection. I asked how the selection was made, the answer was, "Interest with the Minister of War."

4457. (*Dr. A. Smith.*) Suppose that is the case, is it not very natural that the medical officer would avoid doing anything that might give offence to the intendant, as he is the medium of communication between the hospital and the Minister at War?—I do not think that the intendant is the sole medium of medical communication, for the medical officers are also reported on annually by the inspectors of hospitals.

4458. There is an inspector-general for each division, and in the course of each year they make their journeys round those divisions, and then make reports of what they have seen, and also what they have observed in reference to the medical officers, and send them in to the Minister of War,—is not that the course?—I understood that there were seven inspectors at Paris, and that one of them made an annual excursion, and reported upon the character of every medical officer that he inspected.

4459. Are the appointments of the medical staff in those great hospitals by roster, or how?—The appointments to the hospitals are by competitive examination, that is to say, a hospital is supposed to be a prize, not for increase of pay, but because there is less discipline, and a man may live cheaper. The surgeon of a regiment is obliged to go to certain expenses, and he is under the control and discipline of his commanding officer.

4460. They have no regimental hospitals?—Yes, but for trifling cases; but getting into a divisional hospital is supposed to be a prize. The surgeon of a regiment has to pass an examination to get to it.

4461. Are you not aware that there is a regular rule in the French service, that in consequence of their having no regimental hospitals, and in consequence of its being known that officers must serve two and sometimes three years with a regiment, and that they lose so much knowledge during that time, that they are, after having served that time, re-appointed to general hospitals?—The surgeons, I understood, were appointed for some few years, and the divisional hospitals were held out to them as rewards.

4462. (*President.*) Did you examine their forms and books at all?—Yes.

4463. And case books?—They have no case books such as we have.

4464. Except what every man would enter for his own benefit as the result of experience?—Yes.

4465. Is that exacted from them?—No.

4466. Practically do they generally keep case books?—Not as we do, theirs is a very simple form.

Dr. Henry Mapleton.

15 June 1857.

*Dr. Henry
Mcpherson.*

15 June 1857.

4467. They have, I suppose, a book of discharges and admissions?—Yes; and the form will be laid before the Commission.

4468. (*Sir James Clark.*) Do they not keep a history of the cases?—Not as we do.

4469. I suppose there is a form by which the diet is prescribed for each separate patient, which is brought to him?—Yes; the patient gets his diet in this way—an orderly from each ward goes to the kitchen for it, and the sister of the kitchen sees that it is distributed properly, and a sister of the ward sees that the patient gets what he is entitled to.

4470. How does the orderly know what the diets are?—It is marked on the ticket of every bed.

4471. Does much disease exist in the nature of hospital disease?—I was told that no special disease existed, or originated in the hospitals, such as hospital gangrene, erysipelas, or cholera, &c.

4472. Have they a special corps for nurses?—The present Emperor has just commenced forming a corps of sisters for military hospitals.

4473. They have men nurses also, have they not?—Yes.

4474. In what proportion?—In the men's wards, for 30 men they have about two men and one woman; and in the female wards they have two women and one man for the same number.

4475. In the military hospitals how was it?—The Emperor has just instituted a new system of sister nursing.

4476. (*D. A. Smith.*) From what source are the sisters obtained?—They are sisters of charity, and they pay them in civil hospitals—I think 400 francs a year.

4477. Is that paid to the sister herself?—Yes; with food and lodging in addition.

4478. Are not the sisters obtained from some general establishment?—From the Hotel Dieu, I believe.

4479. Do they pay the money to her?—Yes, in the civil hospitals; in the military hospitals it is not yet decided upon.

4480. (*President.*) Is their nursing good?—Very good indeed; as regards the objection that was made by the French medical officers to being placed under the intendants, they said that the sick suffered from the position which they held—that the system was such that the intendant would not obey the orders of the medical officers, as he had to carry out the orders of the Minister for War, and that the medical officers were to confine themselves to certain things connected purely with the treatment of the sick.

4481. (*Dr. A. Smith.*) Do you consider that the present diet of the soldier is sufficient for an able-bodied man doing the duty that the soldier is required to do?—I had to report in my annual report two or three years since that there was no improvement that I thought necessary in this respect; therefore, having made that report, I must say that under the rate of pay which the soldier has now, I do not think it can be improved; at the same time I think that a soldier does not get sufficient food, but his pay must be increased to give him more.

4482. (*President.*) If you gave him an enlarged ration, not only of bread and meat, but of all the necessaries that he gets for himself, and had one uniform stoppage, so as to ensure a man in every climate enough, would that be an improvement?—A very great improvement. I think it is necessary for the well-being of the soldier. I think that in the cooking it is necessary to make allowance for wastage; and the three-quarters of a pound of meat that a man gets is very little, especially if it is not properly cooked.

4483. If the stoppage were made to correspond with that which is now stopped, first from his ration, and secondly from his messing, about 8½*d.*, could you not give the soldier three very good meals?—Yes, but the 8½*d.* includes, in the infantry, the washing, and in the cavalry, the 10*d.* that a man pays for his ration includes oil and sand, &c., for cleaning saddlery, as well as a greater sum for washing than the infantry man

pays, and therefore you must make allowance for the extra sum expended by the cavalry soldier for those items in framing a charge for him.

4484. (*Dr. A. Smith.*) Should there not be at least the means of baking, boiling, or roasting?—I think so.

4485. (*President.*) You gave evidence before Mr. Stafford's Committee in the House of Commons, as to the manner of conducting examinations for first entry into the army medical department?—Yes.

4486. Do you think competitive examinations good or not?—Yes; I said that I thought a competitive examination was necessary.

4487. Are you at all acquainted with the examination instituted by the East India Company?—Only from hearsay.

4488. Is that the kind of examination that you mean?—I do not know, but what I mean by a competitive examination is that you must have a practical competitive examination; but it would be useless to attempt that unless the inducements held out were sufficient to bring men forward for that practical competitive examination.

4489. Supposing that a competitive examination were held out, do you think that the competitive examination would frighten men away?—No, not if sufficient inducements were held out.

4490. Are you aware that in the East India Company, since the introduction of the competitive examinations, although the pay and emoluments have been unaltered, they have more candidates now than before?—No, I am not.

4491. If that is so, would not that satisfy you that the competitive examinations have rather attracted men than driven them away?—I was not aware of that, but I should have thought that it was the reverse; and I can only account for it by supposing that before the competitive examination was introduced, the patronage was in the hands of the directors, and whether a man was a good or a bad man that patronage obtained him, after a certain examination, entry into the service, and not that the competitive examination itself brought more men forward to compete.

4492. When first the competitive examination of the East India Company was introduced, there was no question of patronage, but latterly they have got better men, and in greater numbers, than they did in the earlier competitive examinations?—If the period of the first competitive examination was sufficiently long to test that, well and good.

4493. But does not that show that the competitive examination does not frighten men away?—It will not frighten men away if the inducements are such as to make the service a popular one.

4494. Whether the service be a good or a bad one, it is not the competitive examinations that will frighten them away?—Yes; I think if the service is a bad one, that competitive examinations would frighten men away.

4495. If it is a bad service, an ordinary examination would frighten them away?—And so it has done; men will not come forward at all if a service is a bad one.

4496. Are you acquainted with the subject of the inspection of senior officers over the juniors?—Yes, I am.

4497. Do you think that it is right that it should be carried to so great an extent?—I think that an inspecting medical officer in our army should be a man of greater age and experience than those whom he inspects; at present, a staff surgeon of the first class inspects without necessarily being of greater age or experience than those he inspects.

4498. You would not trust inspectorial duties to any rank lower than that of deputy-inspector, and you would make the first-class staff surgeon an executive officer?—If I had the modelling of the department, I would abolish the rank of staff surgeon of the first class. I consider it an injurious one to the service. I think we should increase the number of our higher ranks of deputy-inspector and inspector, and reduce that rank altogether.

4499. You would raise the position in pay and emoluments of the regimental surgeon, the present second-class staff surgeon, to compensate him for the loss of the other grade?—I would give them the position the staff surgeon first class now holds, after a certain number of years' service, and abolish the other grade altogether.

4500. What is your objection to the examination of the first-class surgeon?—I think that the direct interference by men of about the same standing, and they may be even juniors, is injurious to the service, by destroying the zeal of those inspected. A staff surgeon of the first class, or other inspecting authority, has the power of interfering directly in the treatment of the sick.

4501. Practically, does he do so?—Yes, I have known instances of it. I have been interfered with. I have been ordered, since my promotion to surgeon, and within the last ten years, by a staff surgeon of the first class, to alter the prescription I had written for a patient.

4502. And against your own judgment?—Yes, but I did not remonstrate, for I considered he had the power,—it is a matter of discipline.

4503. But that power would exist just as much in the hands of the deputy-inspector?—Yes, but he would be a man of much greater age and experience, and consequently more likely to do his duty with courtesy and judgment, than a man who is a junior or of nearly one's own standing; and I also think would be less likely to interfere with the treatment at all; and I think that this interference has chiefly taken place between men of about the same length of service.

4504. (*Dr. A. Smith.*) Do you mean to say that a direct order was given to you by a staff surgeon of the first class to change the treatment of your patient, and if so, did you adopt the treatment he prescribed?—Yes.

4505. (*President.*) Was it said in the way of an order or as advice?—I took it as an order, I felt much annoyed at the time, but I did not remonstrate, as my acquaintance with the staff surgeon first class was then of recent date.

4506. (*Dr. A. Smith.*) Was it not your duty to have remonstrated then?—It might have been my duty, but I would rather not remonstrate under such circumstances, and if it happened again I should do the same, unless I felt that the patient would be injured by the alteration. I did not remonstrate, as it was only one simple medicine that was substituted for another. If I had thought that the patient would have sustained any injury, I would not have assented, but I considered that the officer had the power, and I did not call that power in question.

4507. Do you understand, from your experience in the service, that that is anything like the ordinary practice?—My experience in the service is this, I know that instance with regard to medicine; with regard to food, I know an instance in which a medical staff officer in charge of a sick man ordered that sick man half a fowl, and the prescribing officer did so upon the express wish of the man, who was supposed to be dying. The fowl was entered in the diet-roll, and the staff medical officer, who was superior to the prescribing officer, found fault and struck the fowl out of the diet-roll. The prescribing officer went home, bought a fowl, had it cooked at his own house, and sent it to the patient, and the patient eat it with great relish. The superior medical staff officer by accident found this out, and made a special report to the Director-General of the army, against the prescribing medical officer, who is now the Director-General of the Army Medical Department.

4508. (*President.*) The fowl was prescribed, I presume, not to restore the man to health, but as an indulgence to the man in consideration of his position?—All extra food may be called an indulgence. A man may be said to be dying, and yet he may live for six weeks or two months, or more, and if we gave men only what was necessary to restore them to health, I do not think we should, as medical men, be fulfilling

our mission. The interference of the staff surgeons of the first class, at Scutari, was carried to such an extent, that the principal medical officer had to remind them that the regimental surgeons were not candidates at Chatham; and he had also to remind the regimental surgeons that they did not act with proper submission to the authority of the staff surgeons,—or words to that effect. This showed the feeling between the two ranks.

4509. Were the staff surgeons inspectorial officers, at Scutari?—Yes, I believe they were, at that time.

4510. Although there were deputy-inspectors there?—I do not think that the deputy-inspectors had arrived in sufficient numbers, but the staff surgeons of the first class were inspectorial officers, to the best of my belief.

4511. Subsequently they were converted into executive officers?—I did not know that.

4512. Originally, the rank of first-class staff surgeon was created, I think, to reduce the number of executive officers?—No; my opinion is, that Mr. Guthrie states that the reason why he recommended this rank to be created was, that he should have a cheap substitute for the deputy-inspector; as he found in the Peninsula six or seven regiments inspected by a staff surgeon, who, not being of superior rank to the regimental surgeon, could not do the duty, and it was necessary to have them made so, and he recommended the creation of the staff surgeons of the first class.

4513. Is the power of the medical officer sufficient, in your opinion?—With regard to the treatment of the sick, I have every power, in my regiment, when serving by myself at a station.

4514. At the beginning of the war, how was that; had you any difficulty with the purveyors?—I have never found any difficulty with the purveyors, but I have never been in positions where I was likely to do so; whenever I have served with purveyors, we have always acted together for the good of the service.

4515. Do you think that the system of making requisitions is capable of improvement?—With regard to requisitions for food and medicines, and the ordinary supply of medicines that we get, I do not know that any alteration is required; but, under certain circumstances, a regimental surgeon's requisitions have to be countersigned by a staff surgeon first class; and I think that under such circumstances this counter-signature ought not to be required.

4516. Suppose a time of war, different regimental surgeons might take different views as to the supply, but the supply to the regiment ought not to depend upon that, but upon the necessity of the case, and somebody must say whether those things were necessary or not?—I think the treatment of the sick should be left entirely to the regimental surgeon, and if he wants certain medicines he ought to get them, or he ought not to be held responsible for the sick.

4517. Suppose the case of an army cut off from its transport, and with a very small supply, what should be done then?—That ought to be decided by the particular circumstances of the case.

4518. But in such cases it would not do to comply with every requisition without considering what applications might come in from other regiments?—Quite so; then it must depend upon the amount of the supplies you have in store.

4519. (*Dr. A. Smith.*) Would you hold that in Great Britain every medicine that was asked for by the regimental surgeon, or any quantity that was asked for, should be invariably given without any supervision?—No; I would always have at the head of the department an inspector-general over everything. I am referring to the question whether the staff surgeon above me should countersign my requisition before it reaches the supreme authority. I wish to have one authority to refer to, and not that I should be independent of the director-general, or principal medical officer of an army or division of an army.

4520. (*President.*) You have expressed some opinions as to the mode in which promotion should be

Dr. Henry Mapleton.

15 June 1857

*Dr. Henry
Mapleton.*

15 June 1857.

carried on, whether by seniority or by selection?—I think that having ensured good men on entry by a proper competitive examination, that ordinary promotion afterwards should be by seniority, unless there is anything against a man, and which a court of inquiry should confirm. If the head of the department thinks it necessary to reward a man who has shown peculiar zeal or talent he should be allowed to do so by brevet rank, and thus he would be able to reward extraordinary merit without doing injustice to the man of ordinary merit.

4521. What do you mean by brevet?—Take the case of a surgeon of a regiment, who distinguishes himself in the field, or in peace time, when any epidemic is raging; I think the head of the department should have it in his power to give that surgeon a step of rank, but without removing him from his regiment; and giving him the pay and retirement of the brevet rank would be a reward.

4522. But that would only be a temporary reward?—The brevet carrying pay with it, and carrying retirement with it, would be a substantive reward.

4523. By brevet rank carrying substantive pay with it, you mean substantive pay without substantive rank?—It is done in the other branches of the service, and supposing it were thought fit to reward a surgeon, why not give him the brevet of deputy-inspector, with the advantage of increased pay, though kept doing the duty of a regimental surgeon?—I would let him go up the list as a brevet officer does in the engineers or artillery.

4524. But still not before his brother officers?—No; and when he became senior regimental surgeon, I would then say to him, You are now on the active list of deputy-inspectors by your regular promotion, and must leave your regiment.

4525. As I understand you, the officer would have the advantage of having the rank and pay of a deputy inspector, and the duties of a regimental surgeon, until he could become promoted by seniority to be a deputy-inspector?—Yes.

4526. Then he would be just where he was?—Yes.

4527. So that it would be only a temporary reward?—Yes; but meanwhile a very great one in difference of pay and rank, and if he wished to retire the difference then would be permanent.

4528. If there were two officers who had no means of performing any great or distinguished action, either in peace or in war—one notoriously indifferent and listless, and a man of no capacity; and another extremely able and very zealous, you would promote the listless and bad officer first if he stood before the other?—Under such circumstances, I think you should not allow the notoriously listless and indifferent officer to remain in the service at all. If he does not deserve promotion he ought to be driven out of it, or punished in some way.

4529. Can you do that?—Yes, certainly.

4530. (*Mr. J. R. Martin.*) Without a court-martial?—Yes; by a court of inquiry, consequent on a report.

4531. (*President.*) One man might be a very clever man and the other the reverse, but both very good; would you carry the least intelligent one on at the same rate as the other?—No; I would give the clever man the brevet if he deserved it. I wish to explain that it is my opinion that, the nature of the service, the immense number of stations there are for medical officers, the nature of the reports made on them, and the varied duties they have to perform, are such as to prevent the head of the department receiving a sufficiently correct estimate of who is or who is not most deserving of ordinary promotion.

4532. There are reports made by inspectorial officers all over the world?—Yes, but they vary; the inspectorial officer at one station makes an annual inspection only. I was in India nearly four years without being inspected.

4533. Are there not case books which are returned home to the Army Medical Department, and do they not give facilities for forming an opinion?—No,

because the registers go for years about with the regiments; they are not sent home annually, they are sent eventually to Chatham; but I do not think they afford the means of finding out a good officer, nor do I know that they are examined for that purpose.

4534. Are the registers of any use?—That I cannot say, after they are sent away from their regiments to Chatham.

4535. Do you not think they are of some use as books in which a man may note down everything that is important in his mode of treatment?—I gave evidence before on that subject, and I said that I considered what was required from us was necessary for the public service.

4536. What is the object of it?—To supply information on various points when required; for example, to the House of Commons, War Minister, Commander-in-Chief, &c.

4537. Could you not furnish that by the admission book?—We have an admission book. I remember an instance in the Isle of Wight; a soldier was discharged the service, and after a time he wrote to the authorities to say that the cause of his discharge was his having received a wound when at field exercise; on referring to my register, I found an entry made in full, and was able from the registers to refute the statement.

4538. Would not the admission book have done exactly the same?—I do not think so; I think the form does not allow sufficient space, and I think, therefore, our registers are necessary.

4539. Do you not think that a young officer who is told to enter every case, important or unimportant, has a perfect confidence that his register will be so voluminous that nobody will look at it?—I do not say that a daily entry is necessary; it is left now a good deal to the discretion of the medical officers; but I think it is a good system for young officers to record cases in that way; it is also a check on the diets, on the wine, and on other things; and in this country I think great loss to the public service will take place if our forms are much curtailed.

4540. If it is valuable in a scientific point of view, as a record of disease and its treatment, would it not be very important to send to officers going to China the case books of the last China war?—Yes; no doubt they might be useful.

4541. Would they be of no value?—That depends on the medical officer who wrote the former reports.

4542. Suppose you were told that those case books had not been sent to the officers going to China, on the ground that they would give us information, would you say that the system was a good one?—I should say that it was the doctors who wrote their cases and reports so badly that were at fault chiefly, and not the system.

4543. If you can tell that by the case book, cannot you tell what a man is?—I do not assume that a doctor writes anything wrong about his patients, but that he writes what is really the case; but I think that at times medical cases can be written without a man knowing anything of the patient, or treatment of disease, and therefore I do not think a case book a sufficient test of zeal or ability.

4544. (*Mr. J. R. Martin.*) By making promotion contingent upon seniority, would you not extinguish competition?—No; I think if you can discover who is the best man, that you ought to promote him before others for the good of the public service.

4545. Has it not always happened that where public servants have been rewarded on the ground of length of service, rather than on the score of excellence, science has languished?—That I am not capable of saying.

4546. Has it not been stated by Mr. Henry Marshall as an axiom, that competition is as necessary to the advancement of science as to the promotion of the mechanical arts?—Competition, if carried out properly, I think is the best system for reward.

4547. How can you have competition if there are not rewards for excellence?—I am referring to the nature of the service of the army medical officer, when

Dr. Henry Mapleton.

15 June 1857.

I say it is difficult to select for merit; if it were a public competitive examination for promotion by merit, then it would be just to select one man and put him over another; but this public competitive examination would be with us quite impracticable.

4548. (*President.*) But might not the general character of the men be judged of by the reports?—I do not think, considering the nature of our service, that reports on the character of medical officers would enable you to select juniors for promotion, without doing injustice to their seniors.

4549. Are you aware that it is done in the navy?—I think a great deal is done by seniority too.

4550. (*Mr. J. R. Martin.*) Are you aware that in the Medical Department of the Indian army the number being very nearly the same as in Her Majesty's service, promotion has been always by the rigid rule of seniority?—Yes.

4551. Has that answered, do you think, well for science, or for the interests of the Indian army?—I do not know.

4552. Are you aware that the rigid rule of promotion by seniority is about to be abolished in the Indian army?—Yes.

4553. By the urgent desire of Lord Dalhousie?—I have not heard that.

4554. (*Dr. A. Smith.*) With regard to rewarding young and deserving officers by brevet rank, would it not be difficult in such a case as this:—suppose I am senior surgeon and entitled to promotion if a vacancy arise, and that a vacancy does not arise for a considerable time, in the meantime you have signalized yourself by energy and zeal and ability, in the discharge of certain duties, and although you may stand twenty below me you are made a deputy-inspector by brevet, still remaining with your regiment; and when a vacancy occurs, and I am made deputy-inspector, I am sent to Shorncliffe, and the regiment to which you belong arrives at Shorncliffe, you having perhaps been made a brevet deputy-inspector three years before, you would take priority of me?—A principal medical officer of a station should ex officio be supreme, and would be so; all that I should claim under such circumstances, would be that he should collect my reports and returns, but not inspect my hospital,—this would be a further reward for the brevet.

4555. (*President.*) You mean that brevet rank should not compete with substantive rank?—Yes.

4556. (*Dr. A. Smith.*) Say that a senior assistant-surgeon is in New Zealand, and that a vacancy arises in Newfoundland for a surgeon, you have only one of two courses open to you, either to keep that regiment without a surgeon for two years, and leave it in charge of a very junior assistant-surgeon, or give the surgeoncy to some person nearer to it, and pass over the man in New Zealand?—I would have a competitive examination on entry, and after that an assistant-surgeon should be promoted by seniority to be a staff surgeon of the second class, and that promotion should be in England, that is to say, wherever the assistant-surgeon was serving he should come to England to study and be reported upon in a military hospital; and on his being reported fit for a regimental surgeon by the principal medical officer, he should be put on the roster for a regiment, and when a vacancy happened, if in New Zealand, he should be sent from the staff to that regiment. I think that great care should be taken before a man is appointed to be surgeon to a regiment, as it is one of the most responsible situations in the army, and a regimental surgeon has, I think, more power to do good or evil, in the ratio as he is a good or a bad one, than almost any other medical rank.

4557. (*Mr. J. R. Martin.*) Has it not been stated by Sir James Macgregor, that he found great difficulty in selecting men for inspectorial offices, even from the very best regimental surgeons; the duties of inspection implying a knowledge of human nature, consideration, and various qualities which are required in the exercise of control over other men?—I think

Sir James Macgregor said that he took all those qualities into consideration in promoting to the rank of deputy-inspector and inspector, and not that he had any difficulty in getting inspectors. He promoted, he said, by seniority of service invariably from assistant-surgeon to surgeon, surgeon to staff surgeon.

4558. (*President.*) After that rank how was it?—From the staff surgeon of the first class to the assistant-inspectors they were all by seniority in the service.

4559. Have you any confidence in negative reports, that is, reports which say that a man must not be promoted because he is not fit?—I think that a man of ordinary zeal and ordinary talent should get his ordinary promotion by seniority. If a regimental surgeon is not promoted because he is a bad medical officer, you keep him in a position where, in my opinion, he can do more injury to the service than the rank above him.

4560. Among the combatant officers is not the Horse Guards system this, that a man shall be promoted from captain to major, and from major to lieutenant-colonel, unless he is reported unfit?—Yes.

4561. Did you ever know an instance of an officer being reported unfit?—Yes, many in my time, physically.

4562. I meant mentally—a man who was a bad officer?—Yes; I have known that.

4563. If the objections that have been made by the Director-General to your system of brevet be sound ones, do you see any method of rewarding superior and able officers?—There are only two ways that I see—by brevet or promotion by selection. I do not object to reward men for superior merit, but I think that men who are equally deserving, but who are not brought to the notice of the Director-General, should not be passed over in consequence of any influences that may be brought to bear in the case of the others.

4564. (*Mr. J. R. Martin.*) But are there such influences?—I suppose there are; and I should say that such influences ought to be prevented.

4565. (*President.*) If every promotion was made upon the recommendation of the Director-General, with the reasons for the selection stated in writing, whether the recommendation was adopted or not by the Commander-in-Chief; would not that be a check upon both parties?—No; I do not think you would treat the Director-General with proper respect if you gave him the power of selecting men, and giving him that power, make him state his reasons to the Commander-in-Chief for exerting it. His reasons for selecting a man for promotion over others must be based upon medical proficiency; and if he lays his recommendation before the Commander-in-Chief, and says, I wish Dr. Mapleton to be promoted, because he is a good operator, the Commander-in-Chief must take that recommendation; he cannot say that Dr. Mapleton is not a good operator.

4566. Suppose the Director-General produced all the reports that he had received, and said, For these reasons, I think he should be promoted over the heads of others; could not the Commander-in-Chief say, Although this is a meritorious officer, yet the account that you give of him is not sufficiently good to justify his being passed over the head of another man?—I think if you placed the Director-General in such a false position, you ought to require from him the character of every medical officer who was passed over, and not only the reasons why he promoted the other over their heads.

4567. Is not the Commander-in-Chief put in the same position, or the Secretary for War when he promotes a man to be General, as he has to publish the reasons in the "Gazette"?—My objection to selection for merit in promotion is the difficulty of being able to determine the relative merits of medical officers. The medical profession is greatly one of opinion, nor

Dr. Henry Mapleton.

15 June 1857.

do I think we are to be judged of in the same way as military officers, whose profession is less a profession of opinion.

4568. Is there not a great deal more difference, between two men, both members of a very scientific profession, than between two lieutenants in a company, who have nothing to do but to manœuvre the company?—I think that it is much more easy to determine the relative merits of two lieutenants than of two doctors, and that you require to exercise more observation with regard to the two medical men than the two military men. No man deserves promotion more than the quiet unassuming man who will get up at night and go to the sick readily and without murmur, with kindness and humanity in all his acts, but who will not perhaps write a good report; and my experience of the profession is, that in nine cases out of ten the best practical men are the worst at making reports;—yet that man will rarely be brought to the special notice of the Director-General for selection for promotion out of his turn; but another, who writes well and practises badly, will.

4569. My question referred to reports made of him by the senior officer, who would know whether he was an attentive and zealous officer?—I think, from the number of colonies that we have, there is a want of means of judging of medical officers by reports made on them; there are many stations where there are no superiors to report upon them. I was for years in India without a superior officer over me.

4570. Do you think that mistakes would be made?—I do not say that the Director-General would be guided by those who report, but I believe great mistakes would be made if reports alone were trusted to.

4571. Do you think that men would sometimes be promoted who were not the best men?—Yes, in six times out of ten.

4572. Is not that the case in seniority?—Yes, but the difference is, that in selection, where you do not promote the best man, you injure the service, as well as all the men who are senior to the one selected, and by doing that you destroy their zeal. In pure seniority you may promote a bad man, but you do not injure the better man who is just below him. If pure seniority cannot be carried out, I think that so many by seniority and so many by selection should be promoted in each rank, say two thirds seniority, and one third selection.

4573. (*Mr. J. R. Martin.*) Would not the third allotted to selection be taken by pure chance?—I think that certainty of advancement in the service is an element of inducement to enter the service.

4574. (*President.*) Is not certainty up to a certain point only an element, and do you not think that certainty may have an effect upon a man of middle age, while to a young man the prospect of rapid promotion by merit will be more attractive?—I think if the head of the department had the power to give reward by brevet, it would be far better for the service than very rapid promotion, as I do not think very rapid advancement is desirable in the Army Medical Department.

4575. Is not certainty an incentive to idleness, as an idle man knows that he will not suffer for it?—That is assuming that we have in our ranks men who will not exert themselves, unless they have something to gain. If such is the case to any extent, we are a more inferior class than is to be found in any other class of society. Military men in their regiments get promoted by seniority, if they have the money to purchase, and many never intend to remain there to get beyond a certain rank, yet they are not more idle than other people, and are as good officers as those who intend to remain in the service—at least such is my experience; and so I hope it is with doctors.

4576. (*Mr. J. R. Martin.*) Has it not been found in the Medical Department in India that owing to the certainty of promotion by seniority there was a great want of zeal?—I don't know; but I should like to see what the reports will be in the Indian army twelve months after the system of selection by merit has been in operation, and when juniors will be promoted for merit over the heads of their seniors.

4577. Has it not been found in civil life that what Dr. Samuel Johnson called the small certainty has so far operated as to destroy zeal in young men, and to take away from them the motives for exertion?—I trust to the good feeling of the surgeon that he will do his duty; there have been many men who will not leave their regiments for promotion, and who expect no advancement, and they have been second to none in the department.

4578. (*President.*) Do you think that the rest of the world are constituted in that way?—Yes I do; if a man is not entirely without a conscience, I think he will do his duty, whatever be his reward. In London, in civil life, there have been men who have risen to great eminence from merit, by taking to a particular branch of the profession; others have risen by having been patronized by noblemen, or persons of influence, others by merit alone, in opposition to all specialities or interests; but as good men are to be found in the country villages in England, where the rewards in a pecuniary sense are but small, and who often labour without any other reward than their own conscience.

4579. Then do you think that success in life has nothing to do with merit?—No; a man must have a certain amount of merit to succeed at all, but it is very difficult in the Medical Department of the army to pick out one man and pass him over another, without doing injustice.

4580. Is it not very difficult to take the senior man in all cases, without doing injury to the service?—There are certain situations to which the head of the Medical Department can appoint a man where he can do no mischief, either in the treatment of the sick, or other duties required of him.

4581. But in the case of an assistant-surgeon, should he be promoted to be a regimental surgeon?—I would first promote him to be a staff surgeon second class, and bring him under the surveillance of the principal medical officer of a military hospital.

4582. (*Dr. A. Smith.*) With reference to the head of the department having the power to place a man where he could do no harm, that power does not exist?—I am of opinion that all duties, except that of the actual treatment of the sick, are of comparatively little consequence to the service, and that a man may do less mischief in the higher ranks than as surgeon of a regiment.

4583. (*President.*) The duties of an inspector are more like the duties of a man at the head of a civil hospital, or the administrator of a hospital?—The treator of the sick is a man who can do more or less mischief to the service, according as he is a skilful doctor or not.

4584. The inspectorial duties are not of so high a character as they are not of a professional character?—Such is my opinion.

4585. (*Dr. A. Smith.*) Are there not a great number of regimental surgeons who make excellent regimental surgeons, but who, if you raise them from that rank to another, would fail entirely, having not the slightest knowledge of administrative duties?—Yes; but it would be unjust not to promote such men by seniority; and if they deserved it before their turn, I would provide for them by giving them brevet rank, and keep them in their regiments, obliging them to retire on completing 30 years' service, if found unfit for advancement.

The witness withdrew.

Adjourned to Wednesday next at One o'clock.

Wednesday, 17th June 1857.

PRESENT :

The Right Hon. SIDNEY HERBERT, M.P.
A. S. STAFFORD, Esq., M.P.
Col. Sir H. K. STORKS, K.C.B.
Dr. ANDREW SMITH.

T. ALEXANDER, Esq., C.B.
Sir JAMES CLARK, Bart.
J. R. MARTIN, Esq., F.R.S.
Dr. JOHN SUTHERLAND.

PRESIDENT, The Right Honourable SIDNEY HERBERT, M.P.

THOMAS ALEXANDER, Esq., C.B., a member of the Commission, further examined.

4586. (*President.*) You have prepared, I believe, a statement of the results of your inspection of the French and Belgian hospitals?—Yes, I have.

4587. Will you have the goodness to read it?—The following are the grades of the medical officers of the French army, with their effective numbers and military rank, namely :

	No.	Relative rank.
Inspecteurs-généraux - - -	7	Major-general.
Médecins principaux, 1st class	40	Colonel.
Médecins principaux, 2nd class	40	Lieut.-Colonel.
Médecins majors, 1st class	130	Commandant.
Médecins majors, 2nd class	260	Captain.
Médecins aide majors, 1st class	400	1st lieutenant.
Médecins aide majors, 2nd class	400	2nd lieutenant.
Médecins sous aides - - -	300	

Candidates for admission into the medical branch of the French army must possess the doctorate of medicine, and be from the age of 22 to 28 years. They undergo an examination by concours, and if selected they are admitted into the imperial military school of Val de Grâce, where they attend courses of lectures by professors specially appointed. The courses comprised are, 1st, lectures on clinical medicine ; 2d, clinical surgery ; 3d, hygiene and military medical jurisprudence ; 4th, diseases and epidemics of armies ; 5th, anatomy of regions ; 6th, operative surgery and bandaging ; and 7th, chemistry applied to hygienic art. The professors are appointed, and receive one-third more pay while so employed, until they are promoted to be inspectors-general, when they cease to be professors. Each professor has an agrégé, who assists him. The professors are always military medical officers, but none of lower rank than surgeon-major are appointed. The professors belong to the hospital, and they are in charge of divisions or otherwise. There are two courses of lectures of four months' duration each. The first course is from the 15th of January to the 15th of May, by professors in anatomy, chemistry applied to medicine, diseases and epidemics of the army, diagnosis, bandaging and appliances. The second course is from the 20th of May to the 20th of September, and the lectures embrace, first, practical chemistry ; secondly, hygiene and military medicine ; thirdly, operative surgery ; and fourthly, bandaging and appliances. There are four lecture-rooms, besides rooms for practical chemistry, pharmacy, and practical anatomy. There is also a library and museum of natural history, with anatomical preparations. But there are no model rooms, with models of barracks, hospitals, and field equipments attached to the school.

The candidates having been selected by concours, remain one year at Val de Grâce, where they attend the lectures which I have just mentioned, and hospital practice ; they are examined every two months by each of the professors, namely, four examinations, and the fifth examination is conducted by a body of civil examiners. If they pass the fifth examination, they are admitted into the service under the head of médecin aide-major of the second class. The number of candidates generally attending these lectures is 40, but at present there are only 26. They receive a certain amount of pay during the year they are attending the above courses, and the year so passed counts towards their retirement ; they are stated to

be generally appointed to regiments on the completion of these courses.

Promotion in the service is partly by seniority and partly by selection ; being from aide-major of the second class to that of the first class, in the proportion of two thirds by seniority and one third by selection, but they must have served two years in the second class before they are eligible for promotion. So also, with regard to the médecin major of the second class, the promotion is in the same proportion, two thirds by seniority and one third by selection, and he must have served two years as aide-major of the first class. For promotion to médecin major of the first class, one half goes by seniority and the other half by selection, and they must have served four years as major of the second class. Above the médecin major of the first class the promotion is all by selection, but an officer must have served three years in that rank before he is eligible to become médecin principal of the second class, and two years as médecin principal of the second class before he is promoted to the first class ; and he must have served three years as médecin principal of the first class before he is eligible to be promoted to inspector-general. During war, and while serving in the colonies, the periods which I have mentioned are shortened.

If a medical officer is sick he has the same period granted to him for the recovery of his health as a military officer, namely, six months with his regiment. After that time he is sent to a hospital, where he may remain under treatment for two years and a half—total, three years ; after which period, if he continues unfit for the service, he must retire. A medical officer can retire after 30 years' service. The ages at which retirement becomes compulsory are as follows:—An inspector-general must retire at 64 years of age ; the médecins principaux of the first class, at 60 years of age ; médecins principaux of the second class, at 60 ; médecins majors of the first class retire at 58 ; médecins majors of the second class, at 56 ; médecins aide-majors of the first class, at 50 ; and médecins aide-majors of the second class, at 50 also.

With regard to the recommendation for promotion in the medical department of the French army, the médecin-major in a corps recommends the aide-major, through the colonel, and the colonel of the corps recommends the médecin major. In hospital establishments the initiative for recommending promotion rests principally with the intendants ; their recommendations are forwarded to the medical inspectors, who, having written their opinions respecting the merits of the candidates, forward the documents respecting the medical officers of corps to the military inspector general of the army, and those in hospital establishments to the intendant military inspectors. These again forward them with their opinions to the Minister-at-War, who lays the same before a commission composed of one general of division, three medical inspectors and two military intendants, the general being president ; and the commission having decided, forward the same to the Minister-at-War, who decides and selects out of the various candidates.

The inspectors-general form a council of health, the senior being the president, under the Minister-

T. Alexander,

T. Alexander,
Esq., C.B.

17 June 1857.

at-War, and they give their opinions (when asked) upon all matters relating to sanitary measures to the Minister-at-War; they however do not take the initiative; they also carry on the correspondence with the medical officers of the army. The inspectors make annual inspections (each naving a particular district), according to published instructions which are minutely laid down; they also make annual reports to the Minister-at-War of their inspections, and a copy of the same is sent to the council of health. The other medical officers only report every three months unless an epidemic or sickness breaks out, in which case they may have to report daily. The inspectors are the only administrative officers, all the other ranks being considered executive. Those of the higher grade are in charge of divisions in hospitals, and are accompanied by younger officers who take down their orders regarding the treatment of the patients, diets, &c. No register is kept of the cases, none being asked for by the Government. Statistical reports twice a year are made up, at certain periods; but they are not sent in until a month after being due; no report is published, by authority, of the collected facts, although it was laid down in the regulations of 1851 that such should be done. I should state that a card is attached to each bed with the name of the patient, the disease, the diet, the treatment, &c., and a tabulated form showing in one line the history of the case, is kept for the purpose of reference, with very little writing; at Val de Grâce there is a register kept of the post-mortem examinations. When the medical officers first enter the service they are generally appointed to a regiment. Aide majors of the first class are appointed to hospitals in the proportion of two thirds by seniority, and one third by selection. The remainder of the aide-majors of the first class and the seniors of the second class, are appointed to corps, and the remainder of the second class are appointed to hospitals. An examination takes place before an aide-major of the first class is promoted to médecin-major of the second class, and by concours from médecin-major of the first class for the appointment to hospitals, as the latter appointments are much preferred.

Medical officers are not consulted regarding the construction, space, and ventilation of barracks or hospitals. The site is selected by the intendant, as also the space allowed. This officer knows nothing of hygiene, yet he decides on all matters connected with the health of the troops, the food, the space allowed in the hospitals, and the barracks. Certain articles are laid down in the diet tables, which are so arranged in portions that the medical prescribing officer has the power of substituting one portion of one article in lieu of another according to the circumstances of the case. Fowls are not named in their diet-tables, and they can only be given with the sanction of the intendant. If he refuses the matter can be forwarded to the Minister-at-War for his decision. The intendant supplies everything for the hospitals. The intendant-general in Paris supplies everything; and contracts are entered into by him for the supply of food, bedding, clothing, fuel, hospital furniture, &c. The engineer only supplies the walls. Medicines are supplied by the pharmacie centrale. In every hospital there is an accountant or comptable, who keeps all the accounts. These comptables rise from the ranks; they commence as assistant-pupils, passing through the different grades of pupils, and adjutants, they become comptables; and for every step they have to undergo an examination. There are also orderlies or infirmiers of four grades in the hospital: serjeant, corporal, 1st soldier, and soldier. An orderly is generally in charge of from 10 to 12 men, and an infirmier major is placed over a division which may consist of two or three large wards. There are also one head cook, and so many assistants in each hospital, according to the size. In all military hospitals, however small, a person called a pharmacien is appointed, whose duty it is to make up the medicines, and in large hospitals there are

several pharmaciens of different grades. In Val-de-Grâce there are 40 sisters, or female nurses, one sister in chief being over them all. The sisters cannot order the orderlies, but they can complain to the infirmier major if anything is wrong with regard to the orderlies. The particular duties of those sisters are, to give medicine and food at certain hours, to attend to all the wants of the sick, and change the linen, &c. There are three sisters in each division, which may comprise two or three wards. The salary of the sister is said to be 400 francs a year. The sisters are said to have a very good effect in the wards, and all speak very highly of them with respect to their usefulness, kindness, and attention to the sick.

With regard to the hospitals, there are, properly speaking, no regimental hospitals in the French army, although a room is generally set apart in each barrack for very slight cases and a few medicines are kept, but all the sick or serious cases are sent off at once to the military hospitals. In the barrack Napoleon, a small room, about 21 feet long, by 19 feet broad, having 11 beds in it, very close to each other, was used as the infirmerie. On entering a hospital everything is taken from the soldier and put aside in a room, and an inventory of the same is made out. Hospital dresses are provided for the patients, consisting of long grey cloth coat and trousers, socks, drawers, and shirts; clean shirts and socks are supplied every week, and sheets every fourteen days, or oftener if necessary; knives and forks are also provided, together with plate, spoon, cup, horns, basin and jug, all of pewter, and a glass tumbler. There is also a small table to each bed, which contains a crockery chamber pot, and the table is so formed as to be used also as a chair. There are curtains to the windows. The bedsteads are of iron, and attached to the head and foot of the same are shelves of wood, four inches broad, for holding articles. On the bedstead there are two mattresses, one of straw and the other flock, a pillow, clean white sheets, and white blankets. While in hospital the soldier receives no pay.

We visited some of the wards at Val de Grâce, in what is called the new building, which new building consists of two wings, one on each side, forming with the old building three sides of a square. These are two stories high, with attics. You enter in the centre of the building, and on each side are two wards on the ground floor, holding 50 patients each, namely, 18 down each side, and two other rows running lengthways up the room of seven each. The ward is about 138 feet long, 51 feet broad, and 14 feet high, equal to about 1,970 cubic feet of air to each patient. There are nine windows on each side. The distance of the beds from each other from edge to edge being 45 inches, the nearest being 34 inches; from centre to centre of bed, 7 feet; and at the ends there is a space of 30 feet between the feet of the beds of the two side rows. There are two stoves, height 5 feet 3 inches, with brass pipe, for heating the ward, small fountain with two pipes, and a basin attached at one end of each. A small lamp is suspended from the ceiling for the purpose of lighting the room. There are no curtains to the beds. At the farthest end was one small room for one patient, and also a small scullery. All the patients dine in the wards. Half way up stairs to the next flat were some privies in the Turkish style, but as there was no supply of water, the effluvia was very offensive from them. We were informed that some pails of water were thrown down them daily. The upper wards corresponded exactly with the one I have just described; so that on each floor there were 102, making 204 on two floors, and, when the attics were occupied with patients, there would be under one roof 306 sick. There was no ventilation except by the doors and windows, the latter opening in the centre. The floors of the wards were oak, waxed clean, and the walls were coloured. The stairs and landings were of wood. We also visited another ward in the old part of the building. The effluvia, in ascending the stairs to the ward, was

dreadful. The ward was about 145 feet long by 42 feet broad, and 10 feet high. It contained 52 sick; 16 on one side, 13 on the other, and two centre rows, lengthways, one being 11, and the other 12; the cubic space to each patient being 1,170 feet. There were 13 windows on one side, and 14 on the opposite side. There was a distance of six feet between some of the beds, and nine feet between the others, along the sides. The furniture, beds, and bedding were the same as in the other ward. There was no place adjoining either of the wards for lavatory purposes; and the ventilation was by the doors and windows only. Hanging from the roof to the centre of each bed, along the sides, were ropes for the patient raising himself by. This hospital has 1,400 beds, but at present there are only 1,000 sick in it. We were informed that no erysipelas or any epidemic had occurred in it. There had been cases of cholera, but the patients were first brought to it, and it did not then extend to the other wards. There is also a classification of the patients. Smallpox and fever cases are kept in separate wards. Attached to the hospital were 24 metal baths for the men, hot and cold; and also some wooden ones for medicated baths; and five baths detached with curtains for officers. In the kitchen there is a good range, and they can boil, roast, and bake.

We also visited the new hospital at Vincennes, which is not yet finished. It forms three sides of a square, the front being occupied with the chapel, receiving room, offices, &c. The two sides are three stories high, with attics, and are divided into wards, containing 40, 24, 12, 4, and 2 beds, and when finished it will hold 480 patients, and with the attics or fourth story, 600 altogether. There are apartments for non-commissioned officers and officers in the vestibule. In the centre of each wing or vestibule are some privies in the Turkish style, on each side, for the patients; also a room for the sisters, and a small kitchen: there is also a stair, but no lavatory apparatus. A ward for 24 patients was about 138 feet long, 25 feet broad, and 13 feet high, giving 1,950 cubic feet, and there are ten windows on each side. The ventilation which is about to be carried out is by extracting the foul air by two openings between each bed, the lower one four inches from the floor, being eight and a half inches by 11, and there is another one about the middle height of the wall. The air descends by shafts, which lead into a large tunnel of brick in the lower part of the building, which runs towards the centre of each wing, whence a direct shaft communicates with the external air above the roof of the building. A stove is placed at the lower part of the upright shaft, and when heated it is supposed the foul air will be extracted from the two tunnels and by the other tubes between the beds from all the wards. Fresh air is drawn in by apertures close to the ground. Two stoves are placed close to these apertures, and when they are heated they create a draught, which is conveyed between the two walls into a tube 23 inches by 12, which runs through the centre of the wards, and the air distributed through so many shafts, according to the size of the ward. There are 18 extractors of foul air for 40 beds, and 12 apertures for the introduction of fresh air. In winter the wards will be heated by hot-water pipes running along the floor of the wards, and entering the shafts, as in Lariboisière. It is supposed that 1,800 cubic feet of air per hour will be introduced for each bed, and that the same quantity will pass out; the section of introduction being twice the section of extraction; but the windows will have to be kept shut, as it will interfere with the ventilation were they opened. The above is very beautiful in theory, but whether it will work practically or effectually is quite another thing. All the stairs and landings in this new hospital will be of wood. There is a corridor all round on the ground floor, 12 feet broad as far as the vestibule in the centre of each wing, and above this is a promenade for the patients not covered in, but there are places for them to sit down upon. Doors communicate all

through from one end to the other, the whole length of each wing.

We also visited the military hospital at Brussels, which is conducted on the same principles, under intendants and infirmiers. The diets are the same, and hospital dresses also are issued; there is one sister, as nurse to each ward. The building is old, and there is a corridor all round the square. We visited one ward on the ground floor for 22 patients, 12 on one side and 10 on the other. This ward was 84 feet long, 27 feet broad, and 19 feet high—about 1,954 cubic feet to each patient. There was a space of 2 feet 8 inches between each bed, 12 feet between the ends of the beds, and 6 feet 8 inches from centre to centre of the beds. There were eight windows on one side, and two end ones, and four places close to the ceiling for ventilation, leading by a shaft to the top of the building. One window was open; and we were informed, that in the summer, when the temperature of the external air is nearly the same as the internal, the ventilation did not act well. There was no hospital smell whatever; in fact it was the sweetest ward that we have yet seen. There was a table and chair for each bed, and two mattresses, the lower one of straw, and the top one of flock. The bedding was very clean—nothing could look nicer. The floor was of oak, which was kept well waxed. There is one shelf at the head of the bed about four inches broad for articles standing. The patients dine in the wards, which are heated in the winter by stoves in the centre of the ward fed by charcoal, with a pipe leading to the chimney. There is one small ward at the end for one patient. Glass tumblers are used for administering the medicine, and the utensils are of pewter. There is a press in the ward, also in the small ward, for dressing articles, &c., and two small fountains for the patients drinking water from with cocks. There are no places for lavatory purposes or water closets adjoining, the latter being at some distance, and seated; the effluvia from them was very bad, there being no water supply to them. One sister has the charge of each ward. We also visited another ward, one on the top flat for 30 sick, 16 on one side and 14 on the other. The windows, which were small and on one side, were all shut. There were three round open places in the roof for heated or foul air to escape, and also two places for the escape of air from the lamps. There were no curtains to the beds, and there were two stoves for heating the ward as below. Everything was very sweet and clean. The hospital has accommodation for 300 sick. There is one orderly for every 15 sick, and one sister-in-chief over all the others. They speak very highly of the female nurses, and of their kindness and attention to the sick, as in Paris. In the kitchen they can boil and roast, and the diets are the same as the French. They breakfast at 10 a.m., and dine at 4 p.m., which they do not consider sufficient. Hospital dresses, consisting of a long blue cloth coat, &c., are furnished to the sick; who receive no pay when in the hospitals, as in France. No registers are kept, but they have the bed card, and the tabulated form, showing in one line the history of the patient, very complete and simple. [*Copies of all returns and diet tables are handed in.*] They have also pharmaciens for medicines, and a small pharmacy, with kitchen attached.

There is only one administrative rank, namely, the inspector-general, who inspects annually. There are six ranks in the medical department, the five inferior being all examined for each step, the examination being competitive, and promotion is by merit alone. If two candidates for promotion are found equal, the preference is given to the senior. Retirement is compulsory for officers ranking with captains at 55 years of age; for superior officers at 63 years of age, and for inspectors-general at 68 years of age.

A recruit enters the French army by conscription at 20, and he has to serve seven years besides the remainder of the year in which he enters. He receives, on entering, 40 francs for his outfit. After deducting

Esq., C.B.

17 June 1857.

T. Alexander,
Esq., C.B.

17 June 1857.

for rations, he is said to have clear seven sous every five days. The ration consists of 3lbs. of bread every two days, beef 250 grammes every day (500 grammes being equal to 1lb.) He has soup for breakfast and dinner, and a certain allowance of white bread for his soup. Vegetables are purchased at the rate of three francs' worth daily, for about 60 men. The soldier has no coffee, tea, or sugar, but eternally beef and bouilli. When on the march each soldier has half a franc a day, and a pound and a half of bread; but no beef or wine is supplied; they must purchase these out of the half franc. He is on guard in Paris every third or fourth day for 24 hours, two hours on sentry and six off; 24 men constitute the main guard, and they have three posts. The soldier is dressed the same in summer as in winter; the pantaloons serve for one year, and the coat, great coat, and epaulettes three years. The stock is soft, of hair and merino; flannel shirts are ordered to be worn on service, and in Algeria. The boots cost five francs four centimes, and they have a guard-cloak kept for the guard.

The barrack Napoleon is built to accommodate 3,000 men; it is in the form of a square with a corridor all round, twelve feet broad, and the buildings are three stories high. The space on the ground floor is occupied as a guard room, prison, kitchens, canteen, school, stables, &c.; there is in the guard room a bench the same as in England. The privies, which are after the Turkish plan, under the second flat, are very offensive. The urinals are made of wood, and there is no water laid on for the purpose of cleaning them. At the bottom of the stairs are stone troughs fixed for washing, three on each stairway, with 14 cocks, seven on two sides, and five in another place. The stairs are double, one on each side, and they, as well as the landing, are of wood. With regard to the rooms for the soldiers, some hold 24 men, and there is a double room with a wooden railing in the centre, having four rows of beds for 48 men. The former for 24 men is 54 feet long, 19 feet broad and 15 feet high, equal to about 640 cubic feet of space to each man. There are two windows at each end, and three circular ventilators on each side, close to the ceiling. The dimensions of the rooms for 48 men are as follows: 54 feet long, 48 feet broad, and 15 feet high, equal to 810 cubic feet to each man. There are three windows at each end, and three round ventilators under the ceiling. Between the windows are racks for the arms, and there are shelves all round the room above the beds. The bedsteads are made of iron with tressel boards, two mattresses, one of straw and the other of flock, white sheets, and a brown blanket. The beds are very close together, being only nine inches apart, and they are not turned up, the men being allowed to lie down during the day. The soldiers dine in the room. There are eight corporals in each company, the senior of whom is in charge of the room. There are no orders about opening the windows, but they generally open them early in the morning. There is one stove for each room, and 60 kilos of wood are allowed for each stove every two days. The light is bought out of their stoppage for the ration. On the same landing with these rooms there is one room for serjeants, 19 feet long and 12 broad, and another for the serjeant-major and fourrier. There are no married quarters for the soldiers, and those married are chiefly the canteen-keepers, or attached to it. No officers live in barracks, except the adjutant, officers for the week being appointed. The soldiers pay barrack damages. In the kitchen they cook by boilers, and there are cooks specially set apart; they breakfast at 9 a.m., and dine at five p.m. When admitted into the hospital for venereal complaints, they never make up their duties. The prices of the articles that are sold in the canteen are fixed by the captain of the staff, one of whom is attached to each battalion.

We visited also the cavalry barracks; we found the soldiers in rooms for 13 and 14 men, and they stated, that they preferred these to larger ones, as being quieter. The stables are ventilated, but not the

barracks; the staircases are of wood, and the landings are tiles.

We also visited the newest barrack in Brussels, which was built of brick, in the form of a square, three stories high. There is an open corridor all round beneath, with a passage above, and rooms leading from it. There are 22 men in each room, 11 on each side. The beds are about nine inches apart; the bedsteads are of iron, and they are supplied with a mattress. Above each bed are two rows of shelves, divided into partitions, and there is a window at one end, and some ventilators. No married soldiers have quarters, except the cantiniers. The canteen consists of two large rooms; there is a kitchen for the sous-officers, and a table d'hôte; the table was covered with white table cloth, and they all dine together. The corporals dine in the barrack rooms. There are also a library and reading room for the sous-officers; the latrines are boxed and seated, but there is no supply of water for them, the urinals are in the same place, and very offensive. We visited the guard room, and we found it furnished very much the same as in England. There was a guard bench, and a raised place for the head. We also saw the cells, which are built in a row, for several men, with a guard bench, and there is a boxed privy in the corner of each cell; there is a window in the roof, grated over for the purpose of ventilation, and also in the passage, and openings besides in the wall of the passage. There is no military lunatic asylum, but lunatics are sent to civil establishments, and are kept by the state. There is also no regimental hospital, but they have a room for trifling cases, the same as the French.

I was informed that there was no lunatic military asylum in France, even at Charenton, and should an officer or soldier become insane, he is kept in the hospital under the observation of the medical officer. When lunacy appears to be confirmed, he is transferred to a special division of the lunatic asylum at Charenton, where he may remain until he dies or recovers. In the provinces there is a lunatic asylum in each department, to which the soldiers may be transferred at the recommendation of the medical officers, and at the expense of the government. The asylum at Charenton is supported by old public grants along with present ones, and the money paid by civilians who have been treated in the establishment. The Minister-at-War has a certain number of appointments in his gift, which he can give to soldiers, or any one who has served the government. Every soldier has a claim on that account, but it must be proved that his lunacy was caused by his service; and if he is in possession of a pension, his friends may remove him from Charenton, and he may still retain his pension.

With regard to the civil hospitals, Lariboisière, for 600 patients, is built in the form of a square, 140 feet across, laid out as a garden, and with a water fountain in the centre. There is also a corridor 10 feet broad, covered in and enclosed all round, and having windows. At right angles to the corridor are three central blocks for sick on each side, three stories high, and between each block there is about 75 feet of space. These blocks contain one large ward on each floor for 32 beds, being 132 feet long, 33 feet broad; the lower one is 17 feet 6 inches high, the middle ward is 16 feet 8 inches high, and the top or third ward is 16 feet 4 inches high, making 2,382 cubic feet for each bed in the lower ward, and somewhat less in the upper ones. There are eight windows on each side, which are always kept shut, and two beds between each window, two feet between each bed. In the male wards, the distance from the centre of one bed to the centre of the other is 5 feet 4 inches; the space between each window is 9 feet, and between every two beds in the floor is an opening of about 10 inches square, and there is another of the same size between the beds, about 8 feet high, none higher. These openings are for the exit of foul air, which is conveyed by tubes to the top of the building. Down the centre of the

wards are four oval shafts with gratings at the top for the access of fresh air, which is driven in by machinery. There is a steam engine of several horse power, which drives a fan and forces the air through a large iron tube, from whence smaller ones pass off, run along the floor in the centre of the ward, and air passes through the grated openings in the four central shafts. This air is supposed to pass over the bed and eventually to escape through the openings between the beds. Heated vapour is also conveyed by tubes under the floor, which pass into the central shafts and the air being heated escapes into the ward during winter. The machine goes night and day and is supposed to throw in 36,000 cubic metres of fresh air per hour through the nine wards. The machinery for ventilation cost 24,000 francs. There are curtains to the windows, and also to the beds. It was stated to us that the patients could not do without curtains to their beds, on account of the draughts. We found the wards clean, the flooring of oak, well waxed, and the walls and roof of Parian cement, variegated like marble, which looks well. There is a table and chair for each bed, and a glass tumbler for the medicine. There were tables down the centre of the wards. The bed-linen was clean, the bedsteads were of iron, and the utensils of pewter. Although everything was exceedingly clean, there was a very close smell in the ward. At the furthest extremity there was a small ward for two patients, and a place for dirty linen. On the opposite side to it there is a privy, after the Turkish fashion, but there is no water supply for it, and it was very offensive. The pan is of crockery. Of course there are no fire places. The top wards are exactly similar, save that on each landing there is a small kitchen for hot water, &c. The stairs and the landing are of wood; on each block there are beds for 102 sick. On both sides of the building there is a room for the convalescents, male and female, to dine in, provided with glass tumblers and decanters, and the table was covered with oilcloth. There are no lavatories adjoining the wards; there are two male attendants and one female nurse for each male ward, and two females and one man for each female ward. There is one male for each male ward, and one female for each female ward, during the night. On the opposite side there are three blocks for the female wards which are of the same length, breadth and height, and are supplied with the same beds, furniture, &c., as the men's wards. There are four round shafts down the centre of the wards grated above, and heated by hot water, for the purpose of causing the air to pass in through the openings on the sides of the buildings. Between each bed there is a place for the exit of the foul air, which ascends through a shaft to the top of the building, the extraction being produced by a hot water cistern at the top, surrounding the extracting shaft, which causes the foul air to ascend. There is also a small opening between each bed close to the ceiling, which, when we visited the hospital was shut, the windows were open and in other respects the wards were much the same as those on the opposite side. The fire and boiler were below for heating the water. The central shaft for the exit of foul air to which the others lead is heated by hot water. We visited both the male and female wards on the 2d of June, about a quarter past 10 a.m., and we found that the female wards had a less hospital atmosphere, and were sweeter than the men's with the machinery at work. However, the door in the female ward was slightly open, and there were three beds unoccupied. In the men's ward the hospital atmosphere was stronger than that of the females. The air passing was scarcely perceptible. It affected the lamp slightly, but it had but little effect in moving a small piece of paper. We found the laundry very good, and the clean linen store well arranged.

In La Charité hospital, for 500 patients, the stairs and landings were of wood. We visited a ward for 120 patients, heated by five stoves; it was 390 feet long, 33 feet broad, 9 feet between the ends of the beds, 3 feet between each bed. The smell was most offensive. There was no ventilation save by the

doors and windows. The beds were curtained. There was a table and chair for each bed, and the utensils were of pewter. The patients dine in the wards. There is a small fountain in the ward, but no lavatory adjoining the ward. There are five sisters attached to the ward as female nurses, and five men for attending on the 120 sick.

The hospital of Beaujon is small, having been originally an old mansion. Four pavilions or blocks, separated from each other by about 75 feet; each pavilion is three stories high, and there is a ward on each floor for 18 beds, nine on each side, and two beds between each window on each side. The ward is 63 feet long, 33 feet broad, and 13 feet high, equal to 1,500 cubic feet per bed. There are three feet between each bed, and 18 feet between the ends of the beds. The patients dine in the wards. There is one privy at one end, seated, offensive. One pavilion is ventilated by an archimedean screw of a half-horse power. The air is drawn down a shaft from some height by a fan and driven and distributed through the wards by one tube for each floor of the building, narrowing as it ascends. The exits for foul air are two openings, one on the floor and the other about the middle height in each corner of the ward, which foul air ascends by shafts to the top of the building. This plan is stated to work well, but when we visited the hospital it was not in operation. The other three pavilions, depending only on the doors and windows for ventilation, were not nearly so sweet, but offensive. There is also a small ward at the end for two sick, as at Lariboisière.

In the Hôtel Dieu they have accommodation for 900 patients. The ward that we visited was for 80 patients, 270 feet long, 45 feet broad, and the roof arched. There is a row of patients down the sides, and a row of beds lengthways up the ward, with a space of three feet between each bed. There are curtains to the beds, and the windows are small and jalousied outside. There is no ventilation, save by the doors and windows, and there was a close hospital atmosphere. They have wards for 12 and 34 beds on four flats or stories. At the hospital St. Antoine they have room for 350 beds, in wards for 22, 35, and 40 beds. We visited one for 22, 11 on each side; the ward was 78 feet long, 21 feet broad, and 16 feet high, and there was no ventilation save by the doors and windows, and by one pane of glass. There were six windows on one side, and none on the opposite; the ward is heated by two stoves. The patients dine in the wards, and one sister and two male orderlies are attached to each male ward. The water-closet is after the Turkish mode, and close to the ward; there was no water supply, and the effluvia was fearful. There is one head sister over 30 sick, and one orderly, male or female, for every 10 sick, either males or females. There is one sister over the kitchen, and also one over the washing establishment.

The hospital of St. Louis is two stories high, and is constructed for 900 beds. We visited a female ward containing 84 beds, six feet six inches from centre to centre of each bed, and three feet between each bed. There are seven windows on each side; the beds, which are curtained, are between the windows. There is no ventilation, save by the doors and windows, which were open when we visited it. The ward was sweet. Its dimensions were 195 feet long, 27 feet broad, and 24 feet high, equal to about 1,500 cubic feet per bed. There is one sister over each ward. The windows are very high, with a small one above. There are two Turkish waterclosets adjoining the female ward; but as there is no supply of water, they were very offensive. There is a small kitchen, also, for hot water, &c. The ward for the men was low, containing 72 patients. The roof is arched and low. There is a small table and chair between each bed, and no curtains. There was a very close hospital atmosphere, and the windows are on each side.

All the civil hospitals which I have mentioned are under the superintendence of a director, who was supreme in the hospital, the medical officers only

T. Alexander,
Esq., C.B.

17 June 1857.

*T. Alexander,
Esq., C.B.*

17 June 1857.

attending to the treatment of the sick. The returns are simple, and there is little or no writing by the prescribing officer; whatever he orders is carried out. The diets are laid down as in the military hospitals, and portions of one article are given in lieu of another, at the option of the prescribing officer. The wards generally are clean, the floors of oak, and well waxed, and generally speaking there are curtains to the beds. The stairs and landings are of wood. The kitchens are good, and adapted for roasting, baking, &c., and are generally under a sister, as well as the washing and laundry establishments; They have generally a good supply of baths of all kinds, both hot, cold, medicated, fumigating, and also vapour. There is also a kitchen attached to the pharmacy for ptisan and other drinks. The system of female nursing is carried out in all under the superintendence of sisters, and the nurses are highly prized for their kindness and attention to the sick. It is stated by all that no erysipelas or any epidemic diseases show themselves in the hospital, unless when in the neighbourhood. The wards are generally speaking too large. There are no fire-places and no waterclosets adjoining the wards, and lavatories are very deficient. Nothing can be worse than the privies. Curtains to the beds are objectionable, as preventing the current of fresh air through the wards.

In the civil hospital of St. Jean, at Brussels, they have accommodation for 384 sick. There are four blocks running at right angles (not so lofty as at Lariboisière), two stories high. The wards contain 24 patients, 12 on each side, and five windows on each side, all shut, two beds between each window. The ward is 102 feet long, 27 feet broad, and 16 feet high, being about 1,836 cubic feet to each patient. There are two square places grated at each end in the corners, about three feet high from the floor, for fresh air, and one also at the door. There are three ventilators under the ceiling on each side for the exit of foul air. The hospital atmosphere was very strong. There are curtains to the beds, and a chair and a table to each bed. There is one privy at the end of the ward, having two seats, boxed, two windows, ventilated at the top, together with a water-pipe and sink. The blocks of building are not sufficiently far apart. Each block contains 48 patients under one roof, and four such buildings on one side make 192 sick; on the opposite side the same, being a total of 384 sick. There are male and female wards in the hospital, and the medical and surgical cases are classified. The hospital is under a director, as in Paris; and the dieting is also the same as in Paris. Female nursing is also highly spoken of.

In the hospital of St. Pierre there is one ward on the ground floor, a new building, capable of containing 16 beds, eight on each side, 74 feet long, 27 feet broad, and 16 feet high,—equal to 1,998 cubic feet for each patient. The bedsteads are of iron. There are three windows on the outside, and two on the opposite side, looking into the corridor, with three ventilators on each side under the ceiling. There is a place fixed on the head of the bed for articles for the patient, but there are no curtains to the beds. No external air is admitted, save by the doors and windows. And there are baths for male and female patients in a house adjoining; but there are no lavatories adjoining the wards. There are sisters both for the male and female wards. The floors were very clean, and well waxed.

All the hospitals, both in Paris and Brussels, are well supplied with all kinds of baths, but they are very deficient in lavatory places adjoining the wards, and nothing can be worse than the water-closets; in fact they were all exceedingly offensive. All the hospital authorities state, that no erysipelas or epidemic diseases originate in the hospitals, and the female nurses are highly spoken of; the kitchen, washing, and laundry establishments are very good. The French wards are, generally speaking, in my opinion, too large. Among such a number of sick one or two patients may disturb the whole ward; and having no fire-places they would not suit English tastes, being so cheerless. Curtains to the beds I do

not approve of, as they interfere in a great measure with the current of fresh air in the wards. Lavatories adjoining the wards are very deficient, and nothing can be worse than the water-closets or privies; they being in the Turkish style, with no water supply, and being untrapped, the effluvia from them is very bad and offensive.

The ventilation may be considered as very deficient in the different hospitals, many of them having no ventilating appliance or means, save by doors and windows, which being under the control of the patients and shut at night, in bad weather and in winter, the wards must be offensive. On our visit to them, many windows being open, the weather being then fine, no doubt we saw them to much advantage; and were it not for the large amount of cubic space allowed, the wards would be far from pleasant. The artificial ventilation carried out by machinery at Lariboisière, as well as by the heating apparatus in the female wards of the same hospital, and which is about to be carried out at Vincennes, is extremely ingenious; but all those artificial means are not only expensive, but apt to become deranged; besides the great disadvantage of not being enabled to open your windows when the system is at work, without deranging the process, and also, as it is supposed, open fire-places would interfere with the same; these are great objections, in my opinion, to the same being introduced to our hospital establishments in this country; more particularly, as I am decidedly of opinion, that wards can be thoroughly and completely ventilated by introducing fresh air by perforated zinc openings into the wards; these communicating on one side directly with the external atmosphere, and on the other with the passages or lobbies, which again would derive their supply from the external air by openings externally, and by louvred panes of glass; these being the means for the introduction of fresh air, assisted in good weather by judicious openings of doors and windows, and with sufficient openings in the roof or ceiling for the exit of foul air, these ventilators being connected by tubes or shafts, and carried up either into the chimney or alongside of it to the top of the building. I feel convinced that were the above plan judiciously carried out in all our hospitals and barracks, the openings for the entrance of fresh air, and the exit of foul air being adapted according to the size of the wards or rooms, with a larger amount of space for each patient, say from 1,200 to 1,500 cubic feet to each patient in hospital, the ventilation would be complete, and at all times we should have in our wards a sweet and fresh atmosphere, besides the great advantage of having fire-places, which add so much to the comfort of the patients. The air through the lobbies could be heated also in winter, which would be a great advantage.

The plans of blocks of buildings detached, as at Lariboisière and at Beaujon, as well as at St. Jean, at Brussels, are good, provided a greater amount of space be given between each block of buildings, the present being far from sufficient. By the above method you can carry out your hospital establishments to any extent. Each block being detached, you have also the advantage of windows on each side, which can be opened, thereby thoroughly ventilating your wards when necessary; very different from the long, narrow, and badly-lighted wards in the Portsmouth hospitals, having only windows at each end. I may add that I have seen no hospitals, either in Brussels or in Paris, that can be compared on the whole to the Melville Hospital at Chatham, as regards cleanliness, lavatory, and watercloset conveniences, &c.

From what we saw and heard of the female nursing in Paris and Brussels, there cannot be a doubt that good results would follow the introduction of a certain number of well-selected educated nurses to our hospital establishments. In Jamaica, in 1837, I recommended female nursing to be employed from what I saw of the evil effects, and even risk of life, by orderly or soldier nursing in serious cases, but no attention was paid then to my recommendation; and from my more extended experience, I am still more

convinced of the advantages that would be derived from the judicious introduction of female nursing into our permanent hospital establishments.

4588. What is the bedding in our military hospitals?—Generally a hair mattress; they were at one time of straw.

4589. Only one mattress?—Yes.

4590. They had at one time a straw mattress?—Yes, a straw mattress below and a flock one above in Paris and Brussels.

4591. Is that as good as a hair mattress;—I dare say it is softer, but I should prefer the hair mattress as being cooler.

4592. In a good many of our hospitals I believe they only have straw?—Yes, they had.

4593. (*Mr. A. S. Stafford.*) Do the beds have wooden laths or ticking in those hospitals?—The bedsteads were of iron.

4594. (*President.*) Are waxed floors capable of being easily washed?—They wash them occasionally to take off the superabundant wax.

4595. You say that there is an examination for promotion to every rank?—Yes; that is in the Belgian army.

4596. Did you ascertain how that examination was conducted?—They said that it was by competition.

4597. Do they trust to a man who passes a first examination without reference to reports about him as to zeal?—They said so.

4598. Do you not suppose that they make some allowance for that?—I do not know.

4599. You stated that you were an advocate for openings to let in the external air to ventilate buildings, not trusting alone to windows?—Yes, if the windows are shut at night you would not have any air in at all, unless other means were adopted.

4600. You think that there might be some artificial ventilation?—I would not trust to artificial ventilation by machinery or by heated air; I am of opinion that the air coming in directly through gratings is the best, otherwise when your wards are shut at night you will have no air coming in. There should also be the means of escape for foul air through the ceiling, and were shafts carried up to the top of the building, there would be no draught, yet a certain amount of ventilation continually going on.

4601. You also stated that you saw nothing better or equal to Melville Hospital at Chatham?—Yes, no hospital surpassed it.

4602. Do you agree with the statement made by Dr. Mapleton, that it is very bad for a patient to be placed with his bed opposite the light?—Some patients object to it, but you could check that by curtains. I think it is a good thing to have a good quantity of light, and then you could ventilate by opening the

windows, not necessarily those opposite to each other. By having windows only on one side, you may be deterred by the weather from opening them at times.

4603. If having windows opposite to the beds is bad, is not that condemnatory of Melville hospital?—Yes, and of one half of the hospitals in Paris. Melville hospital is a very clean hospital, and there are good waterclosets adjoining the wards. It is partially ventilated. It is as clean as any hospital that we saw. The waterclosets are very superior to any either in Paris or Brussels.

4604. You do not object to the light opposite to the patient?—Not with curtains.

4605. Is it not true that you can always darken a wall, but by no artificial means can you lighten it?—Yes, by curtains, &c., and there is another advantage by having windows on both sides, that if you wish to open them, supposing there is a storm, you can open those on the opposite side to that from whence the storm is blowing.

4606. (*Mr. J. R. Martin.*) You would not say that Melville hospital at Chatham is a pattern for hospitals?—No, but I consider that it is a well-arranged and a well-conducted hospital, still it is not ventilated sufficiently at present. I merely mentioned it because it is as good, and much better in many respects, than any we saw.

4607. (*Sir J. Clark.*) Do you not think that curtains in hospitals are bad?—No; to the window they may be necessary to screen the light from the patients.

4608. I mean to the beds?—Yes; I think that curtains to beds prevent a free current of air passing over the patients.

4609. If the ventilation could be made perfect, would it not be better for the patients not to be opposite the windows?—Yes, you might place them between the windows as they do at Paris.

4610. (*Mr. J. R. Martin.*) It is only during a very few weeks in the year that the light could be offensive?—Yes; only for a short period, and then you could check it by curtains if necessary, or by venetian or sun-blinds.

4611. (*Sir J. Clark.*) The report as to the female nurses in Paris was universally good, was it not?—Yes, and they said they had a very good effect in the wards; all spoke in high terms of them.

4612. Are they all connected with some religious establishment?—Yes, of the order of St. Augustin; head-quarters Hôtel Dieu in Paris.

4613. How is the dirty work done in the hospitals? It is done by the orderlies; the nurses merely attend to the nursing and the giving of medicine; then they have a sister over the kitchen who issues out the food, and sees that the diets are properly cooked; and another over the washing and other establishments.

Serjeant HENRY RUSSELL examined.

Serjeant Henry Russell.

4614. (*President.*) You are in the Grenadier Guards?—Yes.

4615. How long have you been in the service?—21 years and six months.

4616. Did you serve in the Crimea?—Yes.

4617. What are you?—Colour-serjeant.

4618. What length of time were you in the Crimea?—I embarked with the troops in February 1854. I left the Crimea after the battle of the Alma.

4619. You are regimental store-keeper, are you not?—Yes.

4620. Were you ever a pay serjeant?—Yes; I paid a company for nine years.

4621. Do you recollect the change that was made with regard to the messing, when the supply was made through the commissariat?—Yes.

4622. Previously to that it had been done by regimental contracts in the Guards?—Yes.

4623. Was it ever much objected to in the regiment at the time that the change took place?—I never heard of it.

4624. Has it worked satisfactorily?—I believe so; and that it has given every satisfaction.

4625. Do you get as good meat as you did under the regimental contracts?—Yes; I have not heard of any complaints.

4626. Do you think it will be possible to extend the system of supply by the commissariat from the bread and meat to the vegetables and coffee, and so on, giving the man his breakfast and dinner, and a third meal as well?—Yes; I think it would be beneficial to the soldier.

4627. What is the stoppage for messing in the Guards?—I am not a pay serjeant now; but I saw a pay serjeant yesterday evening, and I asked him about the different prices, and the charges for messing, and I think it is 4s. 7d. a week that they are under stoppages for; they pay 2s. 7½d. for the bread and meat, and the vegetable money is 1s. 0½d., that is, for potatoes and the herbs that they put in their soup, and for their coffee and tea 5s. 3½d., and then for seven days bread, that is half a pound of bread for the

Serjeant Henry
Russell.

1, June 1857.

evening meal, they pay 5 $\frac{2}{3}$ d.; that makes it 11d. for the bread with the tea and coffee. The total amount of the stoppages for the rations is 4s. 7d.; 6d. for washing, that makes 5s. 1d., and 3s. 1d. the pay.

4628. Your washing is higher than in other regiments?—I believe it is; but we have drawers washed, it is 6d. a week. The regiments of the line I believe do not wear drawers, we do, and of course that makes a difference.

4629. Do you wear a flannel waistcoat?—Yes, an under flannel vest.

4630. Do the men wear it?—Only those who choose.

4631. They can have it as a necessary if they like, can they not?—Yes.

4632. (Mr. J. R. Martin.) Do the men choose to wear it?—Yes.

4633. Do a majority of them choose to wear it?—No, not quite a majority.

4634. (President.) The surgeon can order it if a man's health requires it?—Yes; during the time of the war in the Crimea there was an order then that if a man did not choose to take the long flannel shirt, he was to be furnished with two cotton shirts, and two new flannel vests.

4635. Which do you like the best, a cotton shirt with an under vest, or a flannel shirt?—I prefer a cotton shirt with a flannel vest.

4636. For what reason?—The first thing is the washing; a man that is out in the field, if he has to go down to a brook, or into a dyke, or into a ditch to wash his shirt, the flannel requires very careful washing; and another thing is, that it never looks so well as a cotton shirt, and a cotton shirt is easier to wash, and I know that the soldiers would rather have a cotton shirt, and an under flannel vest, than a long flannel shirt.

4637. They are warmer, are they not?—No; I think they are about equal; I know that cotton shirts and under flannel vests will last the soldier a much longer time.

4638. (Sir H. K. Storks.) Is a flannel vest and two cotton shirts cheaper than a long flannel shirt?—A man must have two flannel shirts, they are not quite so cheap as the flannel shirts.

4639. Then he must have two flannel vests?—Yes.

4640. Which is the cheapest, the two flannel shirts or the others?—The two flannel shirts are the cheapest in buying them, but they do not last so long, and the others are the cheapest in the end.

4641. (President.) In the line the men do not wear any flannel vest underneath?—I do not think they do.

4642. Who manages the messing in the Grenadiers, who makes the purchases?—The pay serjeant; the company choose their own tradesmen, who shall serve them vegetables and coffee; the pay serjeant makes a weekly contract with these tradesmen to supply them, and if the tradesman does not bring the supply into the barracks, it is fetched in by a fatigue party from the company.

4643. What is the check that you have upon the pay-serjeant as to his making the contract properly, and getting you the best things for the money?—The company have their check themselves; the company is at liberty to change the tradesman at any time they choose.

4644. Could they change the pay-serjeant too?—No. The company, if they feel dissatisfied with a tradesman, merely name it to the pay-serjeant at the end of the week, and they say they wish to go to somebody else, and then they name who they wish to serve them.

4645. What is the advantage to the pay-serjeant; what does he get for taking all this trouble?—He has no advantage, only what the captain of the company allows him for paying the company, that being part of his duty.

4646. (Mr. A. S. Stafford.) They cannot gain any indirect advantages by dealing with these tradesmen?—No.

4647. (President.) They do not get a bonus from the tradesman in the shape of an additional piece of meat for himself?—No; the tradesman furnishes the troops at the lowest possible price, so that he could not do it.

4648. (Mr. A. S. Stafford.) Have you never known a case in which such an accusation was brought against a pay-serjeant?—No.

4649. (President.) He has not the option of choosing the tradesman?—No; the company choose their own tradesman, and they change him at any time they like. They would name it to the pay-serjeant on the Saturday, and say we do not wish to deal with this man any longer, but to employ another tradesman, and on the Monday the company lets him know what tradesman they have selected to serve them, and then the pay-serjeant goes and makes a contract with the tradesman to serve them for a week, and then if he does not serve them well they are at liberty to break the contract off at once.

4650. (Mr. A. S. Stafford.) Is it the same in the other regiments of the Guards?—I do not know, but I think it is something the same.

4651. (President.) So that the pay-serjeant has no discretion as to whom he would employ?—Not any.

4652. Do you think that if a change was made and all was supplied by the commissariat as the ration is, with one stoppage, that stoppage of course being always the same, there would be any dissatisfaction at the change?—No; I think not. I think the soldier would see through it, and that it was to his advantage. For instance, when the price in the market is high, he can only lay out a small sum, and he does not get the quantity that he would get, if it was served by the commissariat store.

4653. In times of very high prices the government would bear the loss?—Yes; and if the market was rather low they would get it back again.

4654. In the Guards it would operate with advantage, because you are always quartered in a high priced district?—Yes; but I have known things got cheaper in London than in the country.

4655. (Mr. A. S. Stafford.) Does it not cost you less in London than at Chichester?—No; I think not.

4656. Do you think things are cheaper at Chichester?—I think Chichester is a little cheaper as to vegetables.

4657. (President.) What do you say of Winchester?—We found Winchester very dear.

4658. And Windsor?—Windsor is about the same as London.

4659. (Mr. A. S. Stafford.) Chichester is the cheapest quarters of the Guards?—Yes, rather.

4660. How did you find it in Dublin?—I was never there.

4661. (President.) What do the men take for their meals; say for their breakfast?—They get something more than a pint of coffee, a basin of coffee and half a pound of bread.

4662. Any butter?—That is left to their own discretion; if they like to buy butter or bacon, they go to the canteen, and if not they take the bread and coffee.

4663. (Dr. A. Smith.) Do they generally try to get something in addition to the bread and coffee?—Yes, almost every man goes to the canteen and gets a small portion either of butter or bacon.

4664. (President.) For dinner he gets his meat and bread?—Yes, half a pound of bread and his meat and vegetables—potatoes.

4665. Of what does his third meal consist?—It consists of half a pound of bread and a basin of tea.

4666. That half pound of bread he buys himself?—Yes; that is his tea and coffee bread, for which he pays 5 $\frac{2}{3}$ d. for the week.

4667. What else does he get?—At the third meal he either has tea or coffee as he chooses.

4668. (*Dr. A. Smith.*) Does he try to get anything else with it?—I daresay most of them do; I have seen them generally go to the canteen and get a pennyworth or a halfpennyworth of butter.

4669. (*President.*) Do you think that the ration of three-quarters of a pound of meat is enough for a man?—It is enough for some men, but others could eat more.

4670. Three-quarters of a pound of meat with bone when it is cooked comes down to about half a pound?—Yes.

4671. They eat more meat in the day, as they generally get bacon or something else in the morning?—Yes.

4672. At what o'clock do the men breakfast?—At seven in the summer and half-past seven in the winter.

4673. When do they dine?—At half-past 12.

4674. And at what hour do they take their third meal?—At about four in the winter and five in the summer.

4675. Therefore what the commissariat would have to supply would be something more than coffee and bread for breakfast?—Yes.

4676. Or would you confine it to that which you now get by messing, which is only coffee and bread, the bacon being bought at the canteen?—Yes.

4677. The messing does not supply that?—No.

4678. (*Sir H. K. Storks.*) But the messing supplies sugar?—Yes.

4679. (*President.*) Do they take milk in the coffee?—Yes.

4680. Is that supplied by the messing?—Yes, that is paid out of it; there is a regular company's vegetable book, and each tradesman enters the articles that he furnishes to the company in this book, and the bills are paid every week; the top part is for grocery, and the second part is for milk, and the third part is for vegetables; there are three tradesmen who furnish the company with those articles.

4681. (*Sir H. K. Storks.*) You do not send the men outside to buy those things?—That is left to the company. If some of the men of the company would rather go out to a shop and fetch in the things they do so, and if they make an arrangement with a tradesman to bring the goods into the barrack he brings scales and weighs them before him.

4682. Is the tradesman paid on the spot ready money?—He is paid once a week by the pay-serjeant.

4683. Does the pay-serjeant call any of the men of the mess to be present when he pays the tradesman?—No; the tradesman enters the goods himself in a book, and the corporal places his initials on the right every night, as to the quantity being correct, and the fatigue men of the company go and see their own goods weighed up, and then they are answerable to the company that they get their proper weight.

4684. If the commissariat supplied that which is now supplied for the messing, would you confine it to what the messing provides them, or would you include some of the things that the soldier now buys himself?—I think it would be as well to give the mess breakfast as it now stands, but in the evening I think it would be well to provide him with a portion of butter with his tea, and I should recommend that they should have coffee in the morning, and tea in the afternoon.

4685. You were in Bulgaria, were you not?—Yes.

4686. Did you find that the system of these companies supplying themselves with their messing accounts answered there?—We had a commissariat tent opened there.

4687. You found that you could not supply yourselves at all?—Yes, we used to go to the commissariat, and the greatest difficulty arose when the green coffee came out; we had no means of grinding it, and the soldiers used to get a shot and pound it as well as they could.

4688. (*Sir H. K. Storks.*) Without roasting?—No, they roasted it in the camp kettles, but it destroyed the camp kettles, it made the solder run.

4689. (*Mr. J. R. Martin.*) It would be well to send the coffee out ready roasted?—Yes, but I think that tea is always preferable on a campaign, it is so much easier made, unless they could have the coffee sent out to them ground, and all ready.

4690. (*Sir H. K. Storks.*) How do you cook the rations? Is the beef boiled?—Each company selects their own cook and they tell the cook in the morning how they will have their dinner dressed; perhaps to day they will have soup, and to morrow roast meat, and perhaps baked the next day, so that they have constantly a change.

4691. In the different barracks in which the brigade of guards is quartered are there means in the kitchen for baking and roasting?—They are getting those places now made, previously there were not.

4692. What did you do then?—We send the rations out to a bakehouse and pay for them.

4693. How did you pay for them?—They were paid for out of the vegetable money.

4694. Then though the men got bread and meat they got a small proportion of vegetables?—Yes, we used to pay sixpence a tin; it generally used to come to a shilling a company the day they had a bake.

4695. (*President.*) In Bulgaria there was a stoppage of $3\frac{1}{2}d.$, and afterwards there was an enlarged stoppage when the commissariat supplied you with coffee and rice?—Yes; it was $6d.$ on board ship if we took grog, and after that we had a stoppage of $4\frac{1}{2}d.$, that was when we got the tea and coffee.

4696. Did that cause any difficulty in the accounts?—Not any; each man was charged $4\frac{1}{2}d.$ a day for his rations, and when it was $3\frac{1}{2}d.$ he was charged that.

4697. Later in the campaign was there not a confusion in the accounts from having no record of how many days a man had been under one stoppage?—I never heard of it in my battalion, but I left after the battle of Alma.

4698. You say that there is a different stoppage on board ship according as the men took the grog or not; do you think it is a good thing to serve out the spirit ration on board ship?—I think it is one of the best things that the men can have, the water is rather bad on board ship, and this rum is mixed up with a portion of water.

4699. Is it always drunk with water?—Yes, always.

4700. The men are not allowed to take it neat?—No.

4701. (*Sir James Clark.*) What proportion of water is mixed with the rum?—We had one part of rum and two of water.

4702. (*Sir H. K. Storks.*) It was two water grog?—Yes.

4703. (*Sir James Clark.*) Did all the men take it?—Yes.

4704. (*Sir H. K. Storks.*) Was it drunk at the tub?—Yes.

4705. (*Mr. A. S. Stafford.*) Was the rum generally good?—Very good indeed.

4706. (*Sir James Clark.*) Do you think if the water was good there would be the same necessity for the rum?—Yes, they like it.

4707. (*Sir H. K. Storks.*) Do you think that it is good for them?—Yes; I think it is, I should always prefer grog on board ship.

4708. (*Mr. J. R. Martin.*) Do you think it is good for young soldiers?—Yes; the quantity is so small that is given to them.

4709. (*President.*) Does it not create a habit that they cannot cast off afterwards?—I think not.

4710. But a soldier on board ship is not at work like the sailor?—No.

4711. Do you still think that he requires it?—Yes; in the ship that we went out in the sailors were not allowed any grog; it was the Ripon, but I know that if they had a chance they used to try to get some from

Serjeant Henry Russell.

17 June 1857.

Serjeant Henry Russell. the soldiers; the captain restricted them not to have any spirits.

17 June 1857. 4712. The soldiers had it?—Yes.

4713. (*Sir H. K. Storks.*) What do the men in your regiment drink principally in London?—Porter.

4714. Do they like it better than spirits?—Yes, very few soldiers in London drink spirits; it is generally porter or mild ale.

4715. (*Dr. A. Smith.*) Would it not be better to give them ale or porter on board ship instead of rum?—If it could be done the men would prefer beer to liquor.

4716. (*Sir James Clark.*) What quantity of spirits do they get?—Half a gill, eight men to a pint.

4717. (*President.*) Do you like the present forage cap?—I should prefer a peak to it.

4718. What kind of peak—the French peak?—Not the English peak; I should prefer one that stood off more straight; I do not say exactly like the French, not with a cord at the side; but a peak is preferable to the forage cap in hot and in wet weather.

4719. What is the objection to the English peak?—I always consider the peak that we wore did more harm than good, for it laid down so close to the forehead the sun used to strike on the peak and almost blistered the forehead, and in wet weather it was no protection to the face, and the rain ran down just the same as it does now without a peak.

4720. Did it hide the eyes?—It never came down low enough; the cap was rather small and the peak just came down below the eyebrows.

4721. (*Sir James Clark.*) You think that a larger peak extending farther from the face would be better?—Yes.

4722. (*Sir H. K. Storks.*) Your forage caps are not like the forage caps of the line?—Theirs are woven.

4723. Which do you think is the best?—I prefer the cloth cap.

4724. What do the men pay for the cloth cap?—3s. 10d.

4725. Do the men pay for them?—Yes; the first forage cap that a recruit gets is given to him in the kit now; afterwards he keeps up that part of his necessaries himself.

4726. (*President.*) Did you like the cap that the guards had two or three years ago, the pointed cap?—No; it was too hot in summer, and the appearance of the thing was bad.

4727. (*Mr. A. S. Stafford.*) Was it not very generally unpopular with the men?—Yes, they never liked it.

4728. (*Sir H. K. Storks.*) The men wear a white fatigue jacket, do they not?—Yes.

4729. What do the men clean it with?—With pipe-clay.

4730. Do you think that any ill effects result from that white jacket, or that their health suffers from that jacket which is cleaned with pipe-clay?—No.

4731. Which is the most durable, the red fatigue jacket or the white fatigue jacket?—The red one.

4732. (*President.*) The white one is very cold, is it not?—No; it is all made of wool.

4733. Is the stock now worn a good one?—No, it is not.

4734. Do you think it is better, or worse than the old thick stock?—It is better than the one that we had; but there is room for plenty of improvement. I have one here,—this is the present pattern. (*The same being handed in.*)

4735. Have you not one of the old ones?—No.

4736. This is lighter than the old one?—Yes. This is a stock (*producing the same*) that was made by a corporal in the 2nd Life Guards.

4737. Would it last as long as the other?—Yes; it has been in wear nine months.

4738. Has it not a tendency to roll up?—No; that collar round it fits with the seam of the collar of the coatee, and the stock never moves, consequently it is always in one place and keeps its position.

4739. (*Mr. A. S. Stafford.*) May this be worn?—Yes, that stock is being worn by the acting serjeant.

4740. (*Sir H. K. Storks.*) It is not the regulation, and it might be forbidden by the commanding officer?—Yes; this is another (*producing the same*) that I have worn about eight or nine months.

4741. (*Dr. A. Smith.*) Has not this stock become very general in the guards now?—No, this man tried to get this pattern approved of; he served a few of them out, and this was given to me by an officer of the regiment to be tried: of course you can wear that the same as a handkerchief.

4742. (*Sir H. K. Storks.*) In what battalion were you?—The third battalion.

4743. (*President.*) How is this stock known?—It is not known at all only in the man's own regiment.

4744. What is the name of the man who invented it?—Corporal Macdonald of the 2d Life Guards.

4745. (*President.*) One of the faults you find with the old stock is, that it has not that little projection all round it by which it would be kept down by the coat, and it keeps slipping up?—Yes, it turns round and it is too stiff.

4746. (*Dr. A. Smith.*) Does it not also cut the lower part of the neck and chafe it?—I have heard the men complain of it when it has been very hard, but the other being made of soft leather fits all round alike. I should prefer the stock without binding, the binding only wears away.

4747. (*President.*) What is your opinion of the knapsack?—There has been very little alteration made in the knapsacks in the Grenadier Guards, and I cannot speak to the last pattern.

4748. (*Sir H. K. Storks.*) Is the new knapsack a better one than the old one?—Ours have had very little alteration made in them.

4749. You fold your great coat now instead of carrying it rolled?—Yes.

4750. Is that as good as being rolled?—I always like a coat rolled on the top of a knapsack.

4751. Does not that inconvenience a man in sloping his arms when marching?—No.

4752. Does it not interfere with the rear rank firing?—No, not if the coat is done up very neatly, and put on the top of the knapsack, and made to ride near to the pack.

4753. Does the pack ride more easily rolled up on the top than the other?—Rolled up on the top.

4754. Is the breast strap very inconvenient?—I do not think it is of any service.

4755. (*President.*) Have you ever tried Berrington's plan of fastening the knapsack in the Guards?—I have never seen it.

4756. (*Mr. A. S. Stafford.*) Do you think the present mode of fixing on the knapsack might be improved or is it in your opinion very satisfactory?—I always preferred the line knapsack to that of the guards, and the way they have of hooking the strap—ours buckles—theirs hooks.

4757. (*President.*) And you require a man to help you on with it?—Yes, most men do; very few men can put on their knapsacks themselves.

4758. (*Sir H. K. Storks.*) You have all the tails of the straps hanging down?—There are small loops and they are tucked in, but I prefer one with a hook to it, so that a man could do it himself.

4759. Are the new accoutrements an improvement?—The waist-belt is a great improvement.

4760. Are the 60 rounds of ammunition carried lightly?—Yes, I think so.

4761. The pouches are hung shorter now—is that an improvement on a march?—Yes, so long as you can get the flap of the pouch open under the knapsack you cannot have it too short to make the least weight of it.

4762. (*President.*) Is the cloth of the present clothing of the guards an improvement?—Yes, it is a great improvement; particularly for the year 57–58.

4763. (*Sir H. K. Storks.*) Is the clothing better made?—Yes, but I do not know that it is particularly

better made than we have had it in our own regiment, because we had an establishment of our own.

4764. (*Mr. A. S. Stafford.*) Do you like the present tunic?—Yes, I prefer the present dress, but with a single breast.

4765. (*Sir H. K. Storks.*) What do you think of the soldiers' great coat, is it convenient?—It is better this last few years.

4766. In what respect?—It is a better material, a little; but I think that the soldiers' great coat ought to be a better article altogether.

4767. And a lighter description of coat?—Yes, rather, and something that would turn the water.

4768. (*President.*) Something that was closer?—Yes.

4769. Why do you like the tunic better than the coatee?—For one thing, there are no epaulettes on the shoulder, and you feel more loose in it; and I think in winter it would be a more comfortable coat having something round the hips.

4770. (*Sir H. K. Storks.*) When a man has been on sentry all night, if the coat has got wet, it is difficult to fold?—Yes, and it rides very heavy after that, particularly with his blanket as well.

4771. (*President.*) All the clothing is made much looser than it used to be?—No, it is about the same.

4772. Are not the sleeves looser?—Yes, they are rather larger, and that is a great deal better.

4773. (*Sir H. K. Storks.*) Do the men wear drawers?—Yes, all the guards wear them, but I do not think that the regiments of the line do.

4774. Are the trowsers made of a good material?—Better than they have been.

4775. A man gets a pair every year, does he not?—Yes, one, but that is not sufficient.

4776. Does he buy another pair in the course of the year?—Yes, one pair of summer trowsers.

4777. (*President.*) What summer trowsers have you in the guards?—It is a sort of tweed.

4778. Are they dark blue?—No, gray.

4779. The white trowsers are quite given up, are they not?—Yes, altogether.

4780. (*Mr. A. S. Stafford.*) Do you approve of that?—Yes, they are very uncomfortable things.

4781. (*Sir H. K. Storks.*) The men had to pipe-clay them?—Yes, they pipeclayed them, and they sometimes put them on wet.

4782. (*Sir James Clark.*) What are the drawers made of?—The men can have either serge drawers or cotton.

4783. (*Sir H. K. Storks.*) How does the soldier pay for them?—He is put under stoppages for them.

4784. How can that be when they are not in the warrant?—A man is put under stoppages, and that is done by the commanding officer.

4785. Are the ammunition boots good boots?—Very bad indeed.

4786. When a soldier gets his ammunition boots, are they remade or does he wear them as they are?—He wears them as they are, but the boots of this year are the worst we have had for a long time; I never saw them so bad.

4787. (*President.*) What is the reason of that?—I do not know. Our boots last year were exceedingly good boots; they were made by a man at Windsor.

4788. (*Mr. A. S. Stafford.*) By whom are they now made?—I do not know; they come from Weedon.

The witness withdrew.

Serjeant GEORGE FENTON examined.

Serjeant Henry Russell.

17 June 1857.

4789. (*Sir H. K. Storks.*) Would it be desirable to give the soldier leather gaiters into which he could tuck his trousers on the march?—That would do in the field; but I do not think it is necessary on home service.

4790. But in the field?—Yes; I think it would be an advantage to him, because it would keep the bottoms of his trowsers out of the dirt.

4791. Do you think socks a very essential article of equipment?—Yes; I should prefer them to stockings.

4792. When you were in Bulgaria did the men wear socks, or did they leave them off?—They all wore them.

4793. (*Dr. A. Smith.*) Do you know anything of a pattern boot made by a man in the Strand, and which was introduced to a certain extent in the guards, with a sort of spring in the middle of the boot?—I saw the boots, but I cannot speak as to how they wore.

4794. (*Sir H. K. Storks.*) Would a laced boot be better than the blucher?—No.

4795. Why?—I have worn laced boots in the service and on the march; in wet weather, on a dirty road, the grit and the water get into the lace holes and blister our feet.

4796. (*Mr. J. R. Martin.*) What do you think of the head-dress of the guards?—A great improvement has taken place in cutting down the cap, it is more comfortable for the head than it used to be; at one time it was very uncomfortable, some 19 or 20 years ago.

4797. Is it not too heavy now?—No; it is not so heavy as it looks.

4798. (*President.*) It is not so heavy as a shako, is it?—I think not; some of the caps are quite as light as the shako.

4799. Is it much more comfortable?—Yes, the grenadier cap is a very comfortable head-dress now that it is lowered.

4800. It protects them from the sun and rain too, does it not?—Yes.

4801. Is it very difficult to dry when it gets wet?—No, it soon dries.

4802. (*Mr. A. S. Stafford.*) Do you approve of it altogether?—Yes, I do; but I would not have them made any higher than they are now; if they were made higher they would become a nuisance on the march in rough weather, and they would become top-heavy, and it would make a man's neck ache.

4803. (*Dr. A. Smith.*) With reference to the ration, you said before that some men are satisfied with the quantity of meat allowed, and that others could eat more; during the 21 years that you have been in the service should you say that the majority of men considered that three-quarters of a pound was sufficient, or did the majority complain of it?—They could eat more, taking the majority of the army right through.

4804. (*Mr. J. R. Martin.*) If they got a larger ration of meat, would they not like to save a part of it for supper?—If they got a larger ration of meat that would do away with giving them butter in the evening meal.

4805. They would like a supper of that kind better?—Yes; and they would leave a portion of it, which they would fry or eat cold at their evening meal.

Serjeant George Fenton.

4806. (*President.*) You are in the artillery?—Yes.

4807. How many years have you served?—Very nearly eight years.

4808. Were you in the Crimea?—Yes.

4809. How long were you there?—I landed there in December 1854, and I left in June 1856.

4810. (*Mr. A. S. Stafford.*) How many clasps have you?—Only one.

4811. How is that?—It was after the battle of Inkerman.

4812. (*Sir H. K. Storks.*) What attack were you in?—In the right attack; then I went to Kertch, and I remained there for about eight months.

4813. (*President.*) What is the whole amount of the stoppage for the ration, the messing and washing in the artillery?—10d. at home,

Serjeant George
Fenton.

17 June 1857.

4814. That includes washing?—Yes; 9d. a day for messing, and 1d. for washing.

4815. (*Sir H. K. Storks.*)—How much is it abroad?—6d.

4816. (*President.*) Why is the difference so great abroad?—I cannot account for it, unless that the government supplies most of the articles abroad.

4817. Then the man has a much larger balance abroad than at home?—Yes.

4818. Do the men think that the stoppage is too much?—Yes, they think that 8d. a day is sufficient.

4819. 7d. for the ration and messing, and 1d. for washing?—Yes, and they think they ought to get the washing done for a halfpenny.

4820. Why should your washing cost double what it does in the line?—I cannot account for that; it causes great dissatisfaction.

4821. (*Sir H. K. Storks.*) How many shirts do the men wear a week?—Two.

4822. (*Mr. A. S. Stafford.*) Do your men wear drawers?—Yes, they do generally.

4823. (*President.*) And a flannel vest?—Yes, that is part of our kit; we have two flannels as part of our regimental necessaries; the drawers are not.

4824. Does not that account for the difference in the price of the washing, as the line have only the shirts to wash?—We think that 3½d. for washing a single flannel is too much; the drawers are not allowed to be washed unless a man pays extra for them.

4825. How do your men manage to get their messing for a third meal?—They deal with any person they think will supply them the best.

4826. Is it done by companies?—It is generally done by rooms; there are 14 men in a room; the non-commissioned officer in the room sees what the articles are that are purchased; he asks the men what he is to buy, and he orders it, and the bill is sent in, and he takes the bill to whoever pays the company.

4827. He takes the stoppage?—Yes; and hands him back the balance, and pays the money.

4828. Who selects the tradesman?—The men themselves; we are not bound to any tradesman, no one has a contract.

4829. If you thought that a tradesman did not supply you with good articles, what should you do?—We should go to another.

4830. That is not left to the discretion of the non-commissioned officer?—No; the men can go where they like, and pay for them, and if they do not wish to pay for them themselves, then they can go to a man who is sanctioned by the captain for giving good work.

4831. (*Sir H. K. Storks.*) Who pays the bills?—Whoever is paying the company, sometimes a bombardier, or a corporal.

4832. Whoever pays the company pays the bills?—Yes.

4833. Does any one of the men belonging to the mess, check the bills?—The bills are sent in to the non-commissioned officer of the mess, and he has a pass book, and in that pass book they put down the price, and the non-commissioned officer looks at it, and if it is right he marks it right, and it is paid.

4834. (*President.*) You pay the market price?—Yes.

4835. If it was done by the Commissariat, could not they get the supply cheaper by making larger contracts?—Yes, we are better satisfied now by getting the bread and meat from the commissariat.

4836. Was that change approved of when it was made?—Yes.

4837. Practically, has it answered?—Yes, I think it has; the only objection that I can see is this, that when we are in the batteries one pound of bread is not sufficient, and the men always get more; they buy extra bread, but the 10d. supports it.

4838. They buy extra bread out of the mess money?—Yes.

4839. The ration is not large enough?—Yes.

4840. Is it large enough with regard to meat, the three-quarters of a pound?—Yes. When the men are in battery they can use two pounds of bread. I could eat it.

4841. Could you not eat more meat?—I do not find that the men wish for any more meat.

4842. (*Mr. J. R. Martin.*) Could you not eat more meat on foreign service?—Yes, we could eat a pound then.

4843. (*President.*) But the meat abroad is inferior?—Yes.

4844. (*Sir H. K. Storks.*) What do the men get to eat for their breakfast?—They get bread and either tea or coffee.

4845. (*President.*) How much bread do they get?—There is no restriction as to the quantity of bread, it is drawn from the commissary, and the men can eat it at one meal if they like; at breakfast they get bread and tea, or coffee, with milk and sugar.

4846. Do they buy anything out of their own pockets to add to their breakfast?—Yes, they generally buy butter, and they get an egg, or a herring; at dinner they have a change every day, sometimes they have a piece of meat baked, sometimes potatoes and meat, they very seldom have soup, they do not have soup once in a fortnight.

4847. Where do you bake?—We send the dinner to a baking house, we pay 2d. for a dinner.

4848. Would it not be convenient to you to have an oven in which you might bake?—Yes, at Athlone, where I was quartered, there was an oven, and that was used constantly, and it saved a great deal; if we send 6 tins in a week we pay 1s.

4849. (*Sir H. K. Storks.*) How do you provide the money for paying for baking?—Out of the mess money.

4850. The men get less vegetables?—No, they get so much less porter; we get from three to four pints a week generally, if the price of provisions is low. When we were in Ireland we got, on an average, 5 pints of beer a week; as the prices of provisions rise we get less beer. In Woolwich we get none.

4851. (*Mr. A. S. Stafford.*) Is Woolwich a dear place?—A very dear place.

4852. (*President.*) When you went to the Crimea, did you find this system going on, that there was a stoppage for the ration, and a stoppage for the messing, the companies providing themselves?—The thing had broken down, and it could not be carried out—the government provided everything and stopped fourpence-halfpenny a day, and if a man got imprisoned he lost all.

4853. Was there not much difficulty in settling the accounts, from there being various stoppages?—A great deal, but not from the stoppages, it was more from want of convenience to get the accounts made up; our commissariat was not properly established.

4854. Had you all your regimental books perfect?—I do not think there were three with the company.

4855. You did not know how many days a man had been on board ship?—Yes, we knew that, by making out the muster rolls on board ship, but afterwards it was mere guess work—we might have had 20 men in hospital and know nothing about it, they were sent down to Balaklava.

4856. I suppose the accounts were settled more by guess work?—Yes.

4857. Were the accounts fairly settled?—Yes, the men were satisfied.

4858. Did some of them think they had been ill-treated?—They were all satisfied as far as the accounts went, the only loss that occurred, I think, must have been a loss to the country—the pay-serjeants did not wish to wrong the men, they would rather give them something over, they stopped as much as they thought was right.

4859. Do you think that a flannel shirt would be a better thing than a cotton shirt and a flannel under-waistcoat?—No, I do not think so.

4860. Have you ever tried the flannel shirt?—Yes I used them in the Crimea.

4861. Did you like them?—Yes, but I like to have a cotton shirt, the men all approve of that—there is another thing, that it is liable to contract a great deal of dirt through the men going out and getting into low houses, and they would bring in a great deal of filth in that way, and it is impossible for the non-commissioned officer to see that all the men change their flannel shirts.

4862. (*Sir H. K. Storks.*) When do they change their shirts?—On Sundays and Thursdays, the flannel waistcoat once a week, and the cotton shirt twice.

4863. (*Mr. J. R. Martin.*) At home you do not think the flannel shirt necessary?—No, and most of the men are of that opinion, I think.

4864. (*President.*) If the commissariat undertook to furnish a man with all that he now has, and three meals a day, and there was one uniform stoppage in all places, and at all times, would it be an advantage or not?—I think it would be a decided advantage.

4865. Would the men dislike the change do you think?—I do not think they would dislike it, some of them would speak against it at first, soldiers will always grumble, but I think in the end they would be decidedly in favour of it, but they would not be inclined to pay 10*d*.

4866. Do you like the stock that is worn by the soldiers?—It used to hurt the neck; I have heard the men complain of it, coming off guard, it makes the neck quite sore.

4867. It is not so stiff as the old one?—No, but we are stooping so much about the guns in battery it catches our necks.

4868. But you take it off when at work do you not?—Not unless we are in battery—in the stables.

4869. But in battery?—When we are at work with the horses inside we do, but when we go out to take the guns to pieces we are buttoned up, and the stock hurts the neck greatly; the moment the men break off parade they unbutton the jacket and take off the stock, and as soon as they hear “right face” the jacket is opened and they take off the stock.

4870. Do the men wear a stock in the artillery or a handkerchief?—Generally a handkerchief, and the officers do not complain of it—I wear a handkerchief, I have one on now, and the officers do not object to it.

4871. Do the men look slovenly with it?—They take more pride in keeping it nicely in front of them.

4872. (*Sir James Clark.*) Would a handkerchief be better than a stock always?—I should not like to give an opinion on that, but I think a handkerchief is the most comfortable.

4873. (*President.*) Is the busby a comfortable dress? No, very uncomfortable—it is very hard, almost as iron, and it presses most dreadfully on the temples, it makes quite a dent in my forehead.

4874. You used to wear a shako, did you not?—Yes.

4875. Did you like that better as a head-dress?—Yes, better, but the men like the present, because it looks better; they are both much the same with regard to comfort.

4876. (*Mr. J. R. Martin.*) The weight and hardness of it are very much complained of?—Very much so.

4877. (*President.*) What kind of forage cap do you wear in the artillery?—We have got a kind of woven cap with a yellow band much the same as the infantry caps, and the men detest it.

4878. Has it a peak?—No.

4879. Why do they dislike it?—It is so heavy, and so large at the top, that it spoils the appearance of the men altogether.

4880. (*Mr. Alexander.*) Does it protect the head well?—Yes; but it is very heavy, it is a capital cap for service.

4881. (*Sir H. K. Storks.*) Why is it a good cap on service?—You can pull it down over your ears, and roll it up, and kick it about, and it is as good as ever.

4882. (*President.*) Do you think that is a disadvantage?—It is a great advantage, but the cap we had

before all the men seemed to praise, the cloth cap with the red band

4883. Was that like the cap the cavalry wear?—It is something like the guards' cap, not quite so large in the crown.

4884. (*Mr. J. R. Martin.*) The advantage of the present cap is that it can be drawn down over the ears, and a man could lie upon it?—Yes; and you could not spoil it.

4885. And that was a great advantage on service?—Yes.

4886. Are your barracks at Woolwich pretty well ventilated?—Yes; I stop in the front barrack at Woolwich, and it is very well ventilated.

4887. (*Sir James Clark.*) Do you ever go into a barrack-room before the men are up in the morning?—Yes; and there is a very nasty smell, quite sickening.

4888. (*President.*) Have the men got convenient places for washing?—Yes; they have every convenience at Woolwich, and also at some of the out-stations that I have been at.

4889. Do you ever bathe?—There is no opportunity; they can scarcely ever bathe at the barracks.

4890. Do you know of the bath in the Arsenal at Woolwich?—Yes; and the men are paraded 100 at a time, and marched down, but that may not come to your turn once in 10 days.

4891. But once in 10 days a man can get a good washing?—Yes.

4892. Otherwise he has no means?—Unless he gets in the washing room, and gets some basins of water.

4893. Can a man wash his feet?—Yes, and they do that once or twice a week.

4894. (*Dr. A. Smith.*) Have they not troughs for that purpose?—No; only iron basins, no troughs.

4895. (*Mr. J. R. Martin.*) You have mentioned the breakfast and the dinner, what do they have in the shape of an evening meal?—Tea and bread.

4896. If the men had a larger meat ration, would they not prefer to have something left over from the dinner, in order to make a kind of supper?—I think they would.

4897. (*Dr. A. Smith.*) You say that you think the men are generally satisfied at home with three-quarters of a pound of meat?—Yes, for dinner.

4898. On occasions when the meat is baked, of course a certain quantity of that meat passes away, and then there is a certain portion of bone?—Yes.

4899. That would reduce each man's allowance to half a pound?—From eight to ten ounces.

4900. Do you think that a man actively employed coming into his dinner would be satisfied to consume only eight ounces?—No; but we generally bake it with flour and potatoes.

4901. (*President.*) There is only that quantity of meat?—Yes, and I think they could eat a great deal more, but I think they are generally satisfied with the quantity.

4902. (*Mr. J. R. Martin.*) That is in consequence of the bulk of the materials which they add to the meat?—Yes, after they have got their dinner they are very well satisfied with it.

4903. (*Sir H. K. Storks.*) Do you get any puddings?—Yes, generally once or twice a week.

4904. Are they paid for out of the messing?—Yes.

4905. (*President.*) Flour, suet, and raisins?—Yes.

4906. Are there urinals in the barrack room for the men?—There are urine tubs.

4907. Do they not smell very much?—Shockingly.

4908. They are put in at night, are they not?—Yes, sometimes they are outside the room, and sometimes inside.

4909. Are they made of wood?—They are large wooden tubs, and they are kept there during the day, and they cause a very disagreeable smell.

4910. (*Mr. Alexander.*) Why are they kept there during the day?—There is no place else, and they are used to carry up the water to wash the room out with.

Serjeant George Fenton.

17 June 1857.

Serjeant George
Fenton.

17 June 1857.

4911. (*President.*) You are in the Normal School at Chelsea?—Yes.

4912. They have some new urinals at Chelsea?—Yes.

4913. Do they answer?—Yes.

4914. They have the water running?—Yes.

4915. And there is no smell?—Not the least.

4916. (*Sir H. K. Storcks.*) If a man wants to go to the rear what does he do?—Sometimes he runs down without anything but his shirt on, with nothing on his feet.

4917. Does the non-commissioned officer lock the door?—No.

4918. (*President.*) If the men had common crockery chamber-pots would they be broken?—I do not think you could keep them there during the day. I think they would be broken and knocked about. The barrack-rooms are very small, there is not much room for passing up and down when the tables are put out.

4919. (*Dr. A. Smith.*) Have you seen the enamelled iron chamber-pots?—No. There is one remark I wish to make, that the men generally get supper for themselves.

4920. Do they have a fourth meal?—Yes; we get tea between half-past six and seven o'clock when we are in battery, and there is the stable hour from half-past six to half-past seven, and the men come out and take a walk till about nine, and then they come in, and they generally have supper. They buy something from the canteen.

4921. (*Sir H. K. Storcks.*) Is not that a proof that the meat ration is insufficient?—Yes.

4922. (*President.*) What is the pay of the men?—1s. 4½d. a day, and they get ninepence when employed in public works, which is very seldom; during my

service I have only received one day's pay for such work.

4923. Where have you been stationed?—I have been stationed in Athlone, Dublin, Woolwich, and Portsmouth.

4924. (*Dr. A. Smith.*) What do the men usually eat for supper?—It is generally pudding from the canteen, polonies and black puddings.

4925. (*Sir H. K. Storcks.*) What do the men generally drink?—Porter.

4926. Not spirits?—No; I never saw spirits brought into a barrack-room, but I have seen cans of porter.

4927. (*Mr. J. R. Martin.*) You do not think the spirit ration is a good thing?—Indeed I do, I think that it saved the lives of a great many men abroad during the winter of 1854.

4928. (*President.*) Is it a good thing on board ship, do you think?—Yes, I think it will keep them from lying about the vessel or getting sick; it keeps up their energies, they are more roused up.

4929. But the men are not at work?—No, but it has a most extraordinary effect upon the men; the men who take none roll about half dead, and the others keep up their spirits and look lively.

4930. (*Mr. J. R. Martin.*) The water on board ship is not very good?—No, it is very bad.

4931. (*Sir H. K. Storcks.*) Are the soldiers in the royal artillery permitted to bring beer into the barrack rooms?—Yes, for supper.

4932. And for dinner too?—Yes, and that is generally found out of the mess money; there is no order against bringing the beer in when the men require it unless it is brought in to excess.

4933. (*Dr. A. Smith.*) Do you think that the spirit ration on board ship would be better than porter or ale?—Yes, I think so; you would get very few men to drink porter or ale on board ship.

The witness withdrew.

Serjeant Joshua
Sotheron.

Serjeant JOSHUA SOTHERON examined.

4934. You are a serjeant in the 85th regiment?—Yes.

4935. How long have you been in the service?—13 years last March. I am at present a student at the Royal Military Asylum at Chelsea.

4936. (*President.*) Do you think it would be an advantage, or a disadvantage, if the soldier were placed upon a fixed stoppage, and the commissariat supplied him with all his meals?—I believe it would be rather an advantage than otherwise.

4937. Would not the soldier complain of it?—He would grumble, unquestionably; they very often do grumble.

4938. He would suspect that he would be worsted by the change?—They do not like to be tied down to permanent contracts; they like to get contracts where the things can be got cheaper. I have no doubt, that if government issue to them good qualities they would be satisfied.

4939. Probably if the commissariat made the contracts they would get the same quality cheaper than the soldier?—Yes.

4940. What is the stoppage for messing in your regiment?—Twopence-halfpenny a day; that is exclusive of the bread and meat.

4941. It does not include washing?—Yes, it does; twopence for mess money, and a halfpenny per day for washing.

4942. Therefore your stoppage is about 6½d. for food?—Yes; and a halfpenny for washing.

4943. Do you recollect when the commissariat contract system for bread and meat was introduced?—Yes, I was in Ireland; it was in 1846 or 1847.

4944. Were the men pleased with that change?—No, they were not; the men will grumble at almost any change, but they became perfectly reconciled to the change after a short time.

4945. The troops that were in Ireland when the change was made were in a situation to get the full benefit of it?—When the change was made, Ireland was recovering from a severe famine, and provisions were very dear; but the men were certainly benefited much by the commissariat contracts, though they did not know it, but they found it out afterwards, and they became perfectly reconciled to the change.

4946. Are the meat and bread as good provided by the commissariat as they were when provided by regimental contracts?—I find a very great difference in England. I found the meat and bread much better in Ireland than in England; the bread was much better liked by the men; it may not have been more wholesome, but it was more palatable.

4947. Have you ever had any service abroad?—No.

4948. Can you describe what a soldier gets for his breakfast?—He gets a pint of coffee with sugar and milk and a pound of bread. At dinner he gets three quarters of a pound of beef, a proportion of vegetables, a pint of soup, and potatoes.

4949. Any bread?—No, except when the potatoes are bad.

4950. (*Sir H. K. Storcks.*)—"The proportion of vegetables" are the vegetables put into the soup, and not the vegetables served with the meat?—Yes. The third meal is a pint of tea and half a pound of bread each man, but that bread for the day is bought out of the mess money, there is tea, and coffee, and sugar, vegetables and bread bought out of that 2d. per diem.

4951. Do the men get anything in addition besides what is provided by the mess money—at breakfast, such as bacon or herrings?—No, unless a man chooses to buy it for himself.

4952. Do they do so?—Yes, they do.

4953. The majority of them?—The majority of the soldiers are very fond of a bit of butter, and sometimes a herring.

4954. At the third meal do they do the same thing?—Yes, the soldiers generally save a little meat from their dinner to use at tea.

4955. Then they must get short commons at dinner?—Yes; they are willing to do that, to have a little meat for their tea.

4956. Do you think that the ration of three quarters of a pound of meat, including bone, after it is cooked, is enough for a man?—It is very little—I have seen on a soldier's plate perhaps not two ounces, but I attribute that to the dishonesty of the cook, and sometimes the cook's assistants.

4957. Do they purloin the meat?—Yes, in fact I have frequently known the cooks punished for selling it.

4958. (*Sir James Clark.*) But suppose that a man had the full allowance?—Then the soldier would have enough, if he had three quarters of a pound without bone.

4959. (*Mr. J. R. Martin.*) It would be enough for his dinner, but nothing would remain over for supper?—No.

4960. (*President.*) How much do you think the man actually gets of cooked meat?—On the average, I should say that each soldier gets of cooked meat, not more than 7 or 8 ounces, if it amounts to half a pound that is the outside; he may on some occasions have had a little more, but very seldom more than 7 or 8 ounces.

4961. (*Dr. Alexander.*) Do you think that is sufficient?—It is hardly sufficient for young soldiers, the old soldiers get accustomed to light eating.

4962. (*Mr. A. S. Stafford.*) Is the meat always boiled?—Yes; in the infantry.

4963. (*President.*) Would it not be an advantage to be able to bake the meat?—Yes, a very great advantage.

4964. Do not the men complain of the sameness of cooking the meat?—It is very common.

4965. Do your men never send out meat to be baked?—No, they cannot afford it.

4966. If they had an oven in the barrack, would it not be an advantage to boil and roast on alternate days?—I think it would be a very decided advantage, and I am sure the men would be very thankful for the change.

4967. Upon the whole you think it would be an advantage to have one stoppage all over the world, and that the commissariat should supply the men with three meals?—I think it would be a very great advantage.

4968. With regard to your regiment, do your men wear flannel shirts or cotton shirts?—Flannels were discontinued by a general order in 1846, and cotton shirts were substituted.

4969. Which do you like the best, have you ever tried flannel shirts?—I like flannel much better.

4970. Is it expensive?—Yes, it is expensive; three flannel shirts cost a soldier 14s. 6d. and the cotton shirts come to something about 2s. 10½d. each.

4971. (*Mr. Alexander.*) Do you wear a flannel underneath?—No.

4972. (*President.*) Did the men like the change from flannel to cotton?—Yes, they liked it very well.

4973. Why?—Because it was a change.

4974. Was it cheaper?—Yes, the shirts were cheaper, and they lasted longer than the flannel shirts did.

4975. The flannel shirts do not wash so easily, do they?—No, I consider that they shrink very considerably.

4976. And they cannot be mended as easily as the cotton?—No.

4977. If you had to wear a flannel vest underneath the calico shirt, that would give you all the advantages of the flannel shirt, but then the expense would be greater?—I do not know whether the men would like it or not; a great many wear these inside shirts.

4978. Do you wear a waistcoat of any kind under your coat?—Yes.

4979. (*Sir H. K. Storks.*) But you do not consider that by regulation it forms any part of the soldiers' necessaries?—No.

4980. (*President.*) In practice do the privates wear a waistcoat?—In the winter time they generally contrive to make a waistcoat of an old coatee or shell jacket.

4981. Do you like the leather stock that is now worn?—Yes, I do.

4982. Is it not too stiff?—No.

4983. Do you recollect how it was worn before the war?—Yes.

4984. It was much stiffer then?—Yes.

4985. Is not the present one an improvement upon that?—Yes, I have not seen the stock that has been recently issued, but before I came to Chelsea there was a soft stock made of satinnet, or a kind of worsted.

4986. Which do you prefer?—I prefer the leather stock.

4987. You would not go back to that very strong thick stock?—No.

4988. (*Sir H. K. Storks.*) Did you ever march with that stock?—No.

4989. What were you before you came to Chelsea?—I was a company serjeant.

4990. You had not been doing duty in the ranks?—Yes; I had been doing duty in the ranks for some years.

4990a. For how many years?—Up to 1854, from 1844 to 1854, 10 years.

4991. (*President.*) Do you think the soldiers like the leather stock?—Yes.

4992. Why?—He prefers the leather stock, because it does not give him that clumsy appearance about the neck that the soft stock would; they like it, especially when marching out; altogether I should say they prefer it to the soft stock. I have heard the men grumble very much about the soft stocks, as they destroy the setting up of the collar of the coatee. The men do not look half as well about the neck as they did when they wore the leather stock.

4993. So, that it is a question of appearance rather than of comfort?—Yes; it is.

4994. But they take them off on the line of march?—They do.

4995. Is not that a proof that they are uncomfortable?—Under certain circumstances they do not like them, that is in the summer time; they would prefer a soft stock then; but for mounting guard, for walking out, or for barrack square drill they have no objection whatever to the other.

4996. That is, when they are called upon to make any exertion, they would rather have a soft one?—Yes.

4997. (*Mr. A. Stafford.*) What do you think of the knapsack; could any improvement be made in it?—I do not think so.

4998. Is it satisfactory as it is?—I do not think it can be made any better, or more satisfactory than it is at present.

4999. (*President.*) Does the soldier generally like the fatigue jacket, or the guernsey-frock instead?—I rather think he likes the fatigue jacket in country quarters; they walk out in the fatigue dress, and they prefer doing so.

5000. A man goes out in his shell jacket to save his coat?—Yes; and they look smarter.

5001. Have you had much experience in barracks?—Yes; I have been seven years in England.

5002. And Ireland too?—Yes.

5003. Should you say that the barrack-rooms generally are tolerably sweet, or is there a sufficient supply of fresh air?—No; there is not.

5004. At night?—No; the effluvia is very unpleasant indeed.

5005. How do you account for that; are the windows kept shut?—They are generally kept shut down.

5006. (*Dr. A. Smith.*) Where there are openings to let air into the barrack room, are not the soldiers very apt to stop them up?—I do not know that they

Serjeant Joshua Sotherton.

17 June 1857.

Serjeant Joshua
Sotheron.

7 June 1857.

are: the men generally like fresh air; and they seem to have an objection to have windows open at night—in the day time there is a sufficient current of air in the barrack-room.

5007. At night they are always closed?—Yes, and in summer time, in the day time, the barrack-room generally is very hot.

5008. Do the men complain of the barrack-room at night?—Yes.

5009. Are they not more afraid of cold than of heat?—Yes; and in the summer time the heat is very oppressive.

5010. Still they always sleep with the windows shut—why is that?—I cannot say, unless it is that they are afraid of catching cold.

5011. (*Sir H. K. Storks.*) Are the beds very closely packed in the barrack-room?—Yes; I have seen them only six inches apart.

5012. What accommodation is there in the shape of urinals in the barrack-room?—The urine tubs are brought into the barrack-room, and if a married person is living there, the tub is left outside of the room door, and it is altogether most disagreeable.

5013. There is a very bad smell from it, is there not?—Very bad indeed.

5014. (*Dr. A. Smith.*) Is not that the principal source of the disagreeable smell that you find in the barrack-room at night?—Not only that, but from so many men sleeping in a room.

5015. Which smell predominates?—The smell from the urine tub predominates.

5016. (*Sir H. K. Storks.*) Do not the men consider it a drawback and disadvantage to them to have married persons in their barrack-room?—Yes, they

do not like it at all; it is quite as objectionable on one side as it is on the other.

5017. (*President.*) Why is it objectionable to the unmarried people?—A soldier will sometimes say foolish things, and let words slip that, perhaps, are not fit for a married person to hear, and they consider that it is a sort of restraint upon them.

5018. Do they take up more room?—Yes, the cooking, of course; the married people in the barrack-room require to cook, and in the summer time the heat is very great, and the slop and one thing and the other about the fire-place is sometimes very disagreeable to the men; and there are children also.

5019. (*Sir James Clark.*) Is there no separation from the married people in the barrack-room?—None whatever; they have sometimes curtains, and in some regiments the commanding officer will not allow them to keep the curtain up, except during the night, in order to have a circulation of air in the room.

5020. (*President.*) The men live a good deal in the barrack-rooms, do they not?—Yes, they do.

5021. Would it be an advantage if they had a day room separate from the sleeping-room?—A very great advantage; they are confined to one room all the day; they have very little room to walk up and down; there is a row of tables up the centre, and a row of beds on each side, and the men are cramped.

5022. Can they get light enough to read by.—Yes.

5023. (*Sir H. K. Storks.*) How do they get it?—They have candles, and in some barracks now they have gas.

5024. (*President.*) Where they use candles the light is very insufficient to read by, is it not?—Very poor indeed.

The witness withdrew.

Adjourned.

Friday, 19th June 1857.

PRESENT:

The Right Honourable SIDNEY HERBERT, M.P.
A. S. STAFFORD, Esq., M.P.
Col. Sir H. K. STORKS, K.C.B.
Dr. ANDREW SMITH.

THOMAS ALEXANDER, Esq., C.B.
Sir JAMES CLARK, Bart.
JAMES R. MARTIN, Esq., F.R.S.

PRESIDENT, The Right Honourable SIDNEY HERBERT, M.P.

Serjeant WILLIAM RHYS examined.

Serjeant Wm.
Rhys.

19 June 1857.

5025. (*President.*) You are troop serjeant-major in the 11th Hussars?—Yes.

5026. How many years' service have you had?—Very nearly seven.

5027. Have you served abroad?—Yes.

5028. Where have you served?—In the Crimea.

5029. How long were you there?—Eight months.

5030. At what period?—I went out with the regiment and came home in the January following.

5031. When did the regiment go out?—On the 10th May 1854.

5032. (*Mr. A. S. Stafford.*) How many clasps have you?—Four.

5033. (*President.*) What does your messing cost you?—Eightpence half-penny per day.

5034. How much does that include for washing?—Six-sevenths of a penny, 6d. for the seven days.

5035. That is about threepence a day in addition to the stoppage for the ration?—Yes; for the remainder—it includes a penny for the half pound of bread.

5036. How do you manage to mess yourself—do you do it by troops?—Yes.

5037. Who makes the purchases for you?—The troop serjeant-major.

5038. Do the men decide what they will have?—Yes.

5039. Who decides what tradesmen they will employ?—The troop serjeant-major.

5040. If the men were dissatisfied with the provisions, what would be done?—Then we change the man.

5041. As long as there is no dissatisfaction, you let the troop serjeant-major choose the tradesman?—Yes.

5042. What do your men have generally for breakfast?—Coffee, milk, and sugar, and the bread is served out in the morning—a pound and a half, the whole is served out in the morning.

5043. The pound that the government supplies, and the half pound which you buy?—Yes; and they take it for breakfast, and perhaps eat half the remainder for dinner.

5044. Do they get anything else for breakfast?—Yes, they buy it and pay for it themselves out of their daily pay.

5045. (*Mr. A. S. Stafford.*) Do they generally buy it?—Some of the men—most of them are under stoppages and cannot afford to buy it.

5046. (*President.*) What do you have for dinner?—Beef and mutton—mutton twice a week—the men have a baked dinner twice a week, on Thursdays and Sundays.

5047. Where do they bake them?—Outside in the bakehouse.

5048. Belonging to the barracks?—No.

5049. Who pays for it?—The baking is paid out of the vegetables that make the soup on other days, such as leeks, onions, flour and oatmeal, the potatoes are the same quantity as on other days.

5050. You take a shorter supply of other things to cover the expense of baking?—Yes.

5051. How often do they bake?—Twice a week, Thursdays and Sundays.

5052. And the other days your meat is boiled?—Yes; and a pint of soup a man.

5053. Have you no oven in the barracks?—No.

5054. Have you ever been in a barracks with an oven as well as a copper?—No.

5055. You are always obliged to take the meat out to bake?—Yes.

5056. What do you have for the third meal?—Tea, milk, and sugar; and there is sufficient to take an extra half pound of bread for their supper.

5057. Some of the men do that?—Some do; those who have money to spare.

5058. In that way, I suppose you get three good meals?—They could do with more meat.

5059. You have three quarters of a pound of meat; what does it come to when cooked and with the bone taken out?—It is a very small quantity; about 8 oz.

5060. Do you recollect when the meat and bread were bought under regimental contracts instead of being supplied by the commissariat?—Yes.

5061. Has the change been a good or a bad one?—A good one; I do not think we could have supplied it for the same price at times when meat has been dearer, not for the price that we get it now.

5062. I suppose the commissariat, buying a very large quantity, can get it cheaper per lb. than you could?—Yes; no doubt of it.

5063. Is it pretty good in quality?—Yes, it is.

5064. Was the change objected to when it was made?—Not to my knowledge. We lay in Ireland at the time.

5065. That was near the time of the famine, was it not?—A little after.

5066. But meat was dear then?—Yes.

5067. So that it was an immediate advantage to the soldiers in Ireland?—Yes.

5068. Could the same thing be done as to messing, so that instead of having two stoppages, one the commissariat and the other the regimental messing stoppage, there should be only one, and the commissariat should supply the vegetables, bread, and all the things necessary for the three meals?—I think it could.

5069. Would the same thing happen with the vegetables as with the bread and meat, that they could do it better for you than you could yourselves?—Yes; I think so.

5070. Are not people apt to be dissatisfied with what is provided for them, though they do not grumble when they provide it themselves?—I do not know; the soldiers, generally speaking, do grumble at a change, even if it is for their good, until they are acquainted with it.

5071. (*Mr. J. R. Martin.*) Until it is established?—Yes.

5072. It would save a great deal of trouble, would it not, to the paymaster and the clerks?—Yes; a great deal.

5073. The stoppages are rather complicated, are they not?—Not so much to them; it entirely lies with the troop serjeant-major in making out the accounts.

5074. In the Crimea did you wear flannel shirts or calico shirts?—I wore a flannel under-vest and a calico shirt.

5075. Did you like it better than a flannel shirt?—Yes.

5076. Why did you like it better?—I fancy it is cleaner; I never did like a flannel shirt myself.

5077. Why do you think it is cleaner; the one is washed as often as the other, is it not?—Yes.

5078. (*Mr. A. S. Stafford.*) In what way is it cleaner?—It is not quite so warm. A flannel vest and calico shirt are not so warm; a man does not perspire so much.

5079. (*President.*) In your regiment what stock are you wearing?—A leather stock.

5080. Is it very much slighter than the old one?—Yes.

5081. And better?—I think it is.

5082. You have lost your jacket and pelisse?—Yes.

5083. You wear a tunic, do you not?—Yes.

5084. Which do you like best?—The jacket and pelisse.

5085. Why do you prefer it?—For the appearance as much as anything.

5086. Is it warmer?—The pelisse is much warmer in winter than the tunic. I wore the tunic last winter.

5087. Could you wear the pelisse over your jacket?—No.

5088. You used to wear it instead?—Yes; in winter.

5089. What is your shako now?—The busby.

5090. Do you like it?—Yes.

5091. Does not it press upon your head?—No; there has been an improvement in it lately. It is made more to the shape of the head than formerly.

5092. Is your new clothing better or worse in point of texture?—Worse.

5093. Since the change was made from the jacket to the tunic?—Yes; when we had jackets and pelisses the cloth in the privates' clothing was, I should say, quite equal to the serjeants' of the present time, or very nearly so.

5094. Formerly was your clothing made up to the regular price, or were not additions made to your clothing by the colonels?—I do not know; there was nothing charged to the men.

5095. You say that the meat ration is not large enough?—I think not.

5096. For the rest it does very well with your messing money?—The bread is quite sufficient, a pound and a half.

5097. On board ship is the ration good?—Very good.

5098. It is a better ration than you get ashore, is it not?—I do not know; I did not care about salt meat.

5099. Were you sick?—Yes, I was.

5100. (*Mr. A. S. Stafford.*) Not all the way?—No.

5101. Did you not like the salt meat after you recovered?—Yes; I did very well after.

5102. How did you like the cocoa?—Not at all, and very few men I found that did like it in the troop that I went out with.

5103. (*President.*) Did you take the spirit ration, or anything in its place?—Yes.

5104. Do you think that a very good thing?—Yes; I do.

5105. What for?—It revives a man.

5106. But the men are not at work?—No; there is nothing in the shape of any liquors to be bought of any kind on board ship. You cannot buy it, and I think that a little served out that way does a man good.

5107. Is that on account of the sickness?—No.

5108. You think that a man is better for having some?—Yes, I do.

5109. (*Mr. J. R. Martin.*) The water on board ship is bad and the spirit improves it very much?—Yes; but we had the system of drinking the spirit at the tub as it was served out.

5110. It was mixed in the form of grog?—Yes; it was served out as two water grog, and we generally added a little more water to it.

Serjeant Wm. Rhys.

19 June 1857.

Serjeant Wm.
Rhys.

19 June 1857.

5111. (*President.*) It was not served out neat?—No.

5112. Does anything remain over from the dinner from which you can make out a supper?—No.

5113. Nothing?—No; some men might have some.

5114. You think that if there was more meat, something might be kept for the supper?—Yes; I think so.

5115. And the men would like it?—Yes; I think so.

5116. Do you think that the men require more meat?—Yes; a pound of meat a man, every man in the regiment could eat it.

5117. (*Mr. A. S. Stafford.*) Were you in the flank march after the battle of Alma?—Yes.

5118. How did you find the commissariat arrangements during that march?—They were pretty good.

5119. Did you get your rations?—Yes, we did.

5120. So far as you can judge the arrangements were satisfactory?—Yes; I think so.

5121. Was that the general opinion?—Yes, that was the general opinion of the regiment at that time.

5122. (*Mr. Alexander.*) How long were you going through that march?—We set off about nine o'clock.

5123. What time did you get to Trakhtir bridge?—I really forget. It was the same evening; but I really forgot the time.

5124. And the following day you went into Balaklava?—Yes.

The witness withdrew.

Colonel Joshua
Jebb, C.B.

19 June 1857.

Colonel JOSHUA JEBB, R.E., C.B., examined.

5125. (*President.*) You have paid a great deal of attention, have you not, to the construction of barracks and prisons and large buildings where great bodies of men are collected?—I have paid considerable attention in the discharge of my official duties to the construction of prisons, and before I entered upon those duties to the construction of barracks. I was also subsequently upon Sir Frederick Smith's committee for inquiring into the best construction of barracks.

5126. Has much change been made of late years in the construction of barracks?—I am not aware that there has been much change in the general construction and accommodation of soldiers; but additional buildings have been constructed which have administered to the comfort of the men.

5127. As regards the dormitories, they remain very much as they were before?—Yes; I think they do. I have not observed in barracks I have visited any great fundamental change in the principle of the construction; but I have not seen the most recently constructed.

5128. With regard to ventilation, have there been any attempts made to introduce more air into them at night?—Yes; attempts have been made to introduce more air, but nothing like to the extent which is necessary, or which has been effected in prisons erected under my superintendence. In the year 1844 I inserted a paper on ventilation in a work on subjects connected with the duties of the corps. It was more immediately addressed to the question of prisons; but I suggested, with reference to barracks, as follows:—"The system adopted for ventilating and warming prisons is equally applicable to barracks, casemates, &c.; and it is scarcely necessary to add that an object which cannot fail to have a beneficial influence on the health of the troops is deserving of serious consideration. A few practical suggestions on this head will form the subject of a separate paper, in the hope it may appear that the adoption of a regular principle of warming and ventilating barrack rooms, &c., will not only add to the comfort of the men, but will prove a measure of economy in diminishing the consumption of fuel."

5129. And do you consider that in your prisons you have brought the ventilation to as great perfection as you can fairly expect it to reach?—I think the ventilation and warming are fully provided for. There are two ways in which ventilation may be effected—one is a scientific or artificial mode of extracting from or propelling air through the different rooms and cells, by which any result as to quantity of air or temperature can be obtained and kept under control. The other, which is more applicable, I think, to barracks, is what may be termed accidental ventilation, merely requiring suitable provision for the egress of the foul air, and ingress of fresh air, in such a manner as to take advantage of circumstances, and not to subject the occupier of the room to a draught.

5130. Is it what you would call open, natural ventilation, as contradistinguished with artificial ventilation?—Yes, it might be so designated.

5131. Merely by orifices for the admission of air, and for its departure from the ward, no attempt being made by machinery either to exhaust it, or drive it in?—Natural ventilation requires very little more than to afford facilities for the entry and exit of air. As regards artificial ventilation, I first had my attention called to the principle on which it could best be effected, by observing the plan pursued in coal mines, where the most complicated workings are ventilated on the very simple principle of extracting the foul air by what is termed an upcast shaft, and admitting fresh air to supply its place by a downcast shaft. Acting upon that principle, I proceeded in the ventilation of the Pentonville prison, which, though not so complicated as a coal mine, was somewhat difficult. There were 500 cells to be ventilated, and the object to be attained was that 30 or 40 cubic feet of air should pass through every cell in a minute, and that means should be provided for regulating the temperature to any point the medical officer might determine. The system has worked admirably for the last 13 or 14 years. I may say that without intermission day and night, 30 to 40 cubic feet of air have passed through every cell per minute, and a remarkable equality of temperature has been maintained.

5132. And that produces no disagreeable disturbance of the atmosphere?—Not the slightest, and the cell is as fresh in the morning when first opened, as at any other time.

5133. Does not it blow the air about?—No; the prisoner is not sensible of the change that is going on. This result is chiefly caused by the withdrawal of the foul air from near the floor, and by a second opening higher up. The advantage gained by withdrawing the air near the floor, instead of admitting it there, is that the occupier is not sensible of a draught, and therefore does not stop it up; another necessary precaution is that of using large flues, so that the required quantity may be introduced at a moderate velocity.

5134. (*Mr. J. R. Martin.*) So that nowhere there be a thorough draught?—No draught is felt. The air comes in at a point over the door, and is withdrawn on the opposite side.

5135. (*President.*) That, you think, is the best arrangement for cellular building?—Yes; this further special advantage is gained, that where a prisoner is employed constantly in mat making, or other dusty occupation, there is a tendency downwards which causes the dust to enter the flue instead of the lungs. We found to what extent this was effected by the quantity of dust which accumulated in the flue, and which from time to time required to be burnt out.

5136. The system which answers for a small cell, would *à fortiori* answer well for a large apartment?—I

should probably take a different course with a large apartment. It would then be right to take advantage of getting rid of the foul air at once. In such a cell as I have described, there was 900 cubic feet of space for a single man, and having the power of withdrawing the air at any point, it was only necessary to look to prison objects; but in a large apartment occupied by many men, where the breath rises at once at a high temperature, it is better, I think, to take advantage of the difference of temperature, and withdraw the foul air from the ceiling.

5137. Where would the tube be for ingress?—Openings would be required in several places. It would not be right to trust to one place either of egress or ingress. If both openings were situated high up in a room, and warm air were introduced, it would pass away by the foul-air openings. I should recommend openings for both foul and fresh air near the floor and near the ceiling.

5138. So many in each ward, according to the size?—Yes, a proportionate area is required, and about a quarter of a superficial foot for each person occupying the room is not too much.

5139. What is the space that you give to each man in the cells?—The cubic contents of the Pentonville cells is 900 feet, but it must be borne in mind that a prisoner may occupy it the 24 hours round, and from year's end to year's end; where other conditions present themselves, the same space is not necessary. At Portland, for example, which is for public works, a man is out at labour in the quarries all day, and only sleeps in his cell, which is seven feet long by four feet wide, and about seven feet six inches high; that is a small space, but the door opens into a large corridor or hall; he thus lives in a large space though confined in a small one.

5140. (*Mr. A. S. Stafford.*) Is it a grated door?—No, the ventilation is by openings under and over the door. This is a section of one of the buildings (*handing in the same*).

5141. (*Mr. J. R. Martin.*) In that case the corridor is the ventilating trunk?—Yes; or it may be termed the fresh air chamber.

5142. (*President.*) What are the cubical contents there?—The cubic contents of the cell itself is only about 200 feet, but allowing for the corridor it is about double.

5143. About the same as is allowed to a man in a barrack?—Taking the corridor in, I dare say it is. This sketch is illustrative of the remarks I have made on the ventilation of a barrack room.

5144. Is that a plan which you have drawn up at my request with a division between the beds?—Yes, the plan you suggested is included in the sketch.

5145. Will you explain shortly the mode by which you propose to effect this?—The ventilation of a barrack will be promoted by the rooms being spacious, with windows at each end, but the *comfort* of the individual soldier is better secured by his being associated with a limited number of his comrades, rather than being in a crowd; hence a difficulty. This, however, might be met by making a division in each room with openings through which a free current of air might pass, as shown in the sketch. (*A sketch was handed in and explained to the Commissioners. See App. LXXIII.*) I think it is desirable to have a room large enough for 24 men, but I do not think that they can be very comfortable together, there are disturbing causes, people going in and out, and large numbers do not associate so well together as smaller bodies do.

5146. Do you think that the men complain of their being 24 in a room instead of 12?—I think you can make them more comfortable in the small rooms. These rooms are 45 feet by 25 for 24 men, divided into two rooms, each 22½ feet by 25, capable of containing 12. Each man has thus about 50 superficial feet, and can have a cubic content of 500 feet; 4 feet of space is allowed between the beds, and a compartment is formed by a small partition of corrugated iron between the beds, projecting 4 feet from the wall. It is made 5 feet 6 inches high, and will secure, to a certain

extent, some of the decencies of life, and some degree of privacy. During the day, from the room being wide, there will be 14½ feet between the partitions, which will give ample space for a table and benches, or stools, which, on many accounts, would be preferable. As there would not out of 12 men be on an average more than 8 actually in the room (except for sleeping), all would participate in the comfort of the fire; in fact, the barrack room would be the most comfortable place that the soldier could find, which I hold to be an object of primary importance, as the basis on which the other and more important improvement would rest. It is now generally acknowledged that the improvement of the dwellings of the poor is indispensable to give effect to the efforts of the clergy and schools. It is the same with the soldier, his material comfort must be provided for before his self-respect can be sufficiently established to enable him to profit by instruction, and value higher objects.

As regards the means of ventilation and warming, it will be observed that there are in the plan certain flues coloured black and others coloured blue. The former represent openings for the exit of foul air, and the latter corresponding openings for the admission of fresh air. The means of securing fresh warm air for the winter is provided by converting the passages into warm fresh air chambers, from which the rooms will be regularly supplied. The vertical flues, which must be trusted to for the escape of foul air, are situated between the smoke flues; but the entire extracting process would be improved if cast-iron flues could be made to some extent in the upper part of the chimneys, which by the radiation of heat would raise the temperature of the extracting flues. It would not add materially to the expense to reduce the whole ventilation to a system, as at Pentonville, and as I should recommend for a hospital. But when men are much in the outer air, it is not necessary to do more than make provision by flues for natural ventilation, and this plan could be applied to the existing barracks.

5147. Upon that plan would not there be a very great increase in the expense?—I am not aware that there would necessarily be a great increase in the expense. The space with barrack room is only 500 cubic feet.

5148. And the barrack regulation is 450 feet?—I think so; it is a trifling increase; but, after all, the cost of the erection of the barrack occupied by the soldier is only one-fourth of the total cost of the whole establishment, so that any trifling increase in cubical content would be not worth naming if any decided advantage were gained.

5149. (*Mr. J. R. Martin.*) Has your suggestion been carried out practically in the construction of any barrack recently?—I am not aware that it has to any sufficient extent. Openings may have been made near the chimney and carried up, but I am not aware that the number of men that occupy the room, and a proportionate area for each has been taken into account.

5150. Do you think that the ventilation at Pentonville would be sufficient for a hospital?—Yes, more than would be required for a hospital. There is a constant change day and night to the extent of thirty cubic feet per minute for each man.

5151. How do you effect the change?—By the simple and inexpensive means of disposing of the flues in such a way as to admit of the extraction of the foul air and the admission of the fresh air. The latter may be warmed to any degree of temperature that may be required.

5152. (*Sir H. K. Storks.*) They are not difficult to manage, are they?—No; nothing can get out of order, and it requires little or no attention. The medical officer occasionally, as he goes his rounds, can apply an anemometer to the foul air flue, and he will know exactly whether the system is working properly. If the ventilation were not in an active state, a fire lighted in the foul air shaft would give an immediate impetus to it.

5153. (*President.*) You very seldom light a fire?—It is seldom required; and the cost of warming and

Colonel Joshua
Jebb, C.B.

19 June 1857.

ventilation, at Pentonville prison, does not exceed a farthing a cell for 24 hours in winter, and less than that in summer.

5154. You call it very inexpensive, as well as being effectual?—Yes.

5155. Still it is not applicable to a barrack?—The principle could be easily applied to a barrack, or to a hospital; it is proposed to do so at the invalid establishment shortly to be commenced at Woking for convicts.

5156. For the criminal lunatics?—No, for invalids; but the lunatic asylum will probably be warmed and ventilated on the same plan.

5157. Are they in large wards, or how?—Some are in wards; but for others individual separation will be required. The ventilation of each will be provided for by the disposal of flues in the wards or cells, and by uniting them in a horizontal flue in the roof.

5158. (*Sir H. K. Storks.*) Could that system be applied with ease to existing barracks?—There is no doubt it could be applied to most barracks.

5159. (*President.*) You would have to build internal or external flues?—Not so; difficulties of no ordinary kind were presented at Millbank, an old existing prison, in which there were five miles of passages. The warming and ventilation were, however, effected without much expense, and the plan works satisfactorily. I would, however, explain to the Commissioners a very simple plan, which was adopted with success at Dartmoor. Across the large rooms in the prison, there were girders, by the side of which, lath and plaster flues, of 18 inches wide and 15 inches deep, were constructed. These flues went to the outer air at both extremities; and the under side of the flue being perforated, when the wind was blowing on one side, the flue being divided in the centre, the fresh air descended into the room, and the foul air was forced out on the opposite side; when the wind changed, the current was reversed.

5160. It goes out to leeward, and comes in from windward?—Yes. (*Another plan was explained to the Commissioners.*)

5161. What is the mode of ventilation that you would recommend, looking at the expense, among other things, if we wanted to create thorough ventilation in the existing barracks; would you take a lath and plaster flue, as one method?—Yes, that is one plan; another would be, to construct a kind of cornice of lath and plaster, and carry it out to the outer air on both sides; one half might admit the fresh air, and the other let out the foul air; a similar flue might be constructed in the angles of a room and be carried up into the roof, there to be discharged. An arrangement of this kind would cost but little and would materially assist in getting rid of the foul air.

5162. (*Sir J. Clark.*) By a current of air?—Yes.

5163. (*President.*) That would be inexpensive?—Yes.

5164. Generally speaking, your impression is, that barracks have no sufficient means of ventilation?—I feel satisfied of it. In connection with the health of troops, I would also mention the importance of making some better provision for drying their clothes, when they accidentally get wet. A drying closet should be attached to each barrack for this purpose.

5165. (*Sir H. K. Storks.*) Are you consulted in the construction of military prisons?—Yes.

5166. Suppose that a military prison is ordered to be built abroad, is the plan sent home to you?—Always. A circular memorandum on construction was promulgated, in order to secure uniformity.

5167. Since what time have they sent home plans for military prisons?—Since the commencement. The paper I referred to was published in 1844, I think; and the whole of the military prisons are erected, as far as may be, on a regular system, both at home and abroad.

5168. Do you remember the military prison at the Mauritius; was the plan of that prison referred to you?—I believe so.

5169. Was the ventilation adapted to the climate?—Yes; but the Mauritius being a warm climate, the arrangements must have differed from those I have explained. These sketches show the method in which a military prison, in a warm climate, might be ventilated. (*Handing in a sketch.*)

5170. (*President.*) You do not think that it would be safe in any case to trust merely to ventilation by windows?—No; the windows cannot be used in winter time. Louvre panes might be introduced or perforated glass, but either of them would be likely to make the men feel the inconvenience of the cold.

5171. Any ventilation would make them cold if the air is not heated?—Yes; it is on that account that I recommend that the air in the passages should be warmed. It is indispensable for any regular system of ventilation that the means should exist of warming the air in winter time.

5172. I asked you to make a plan of a barrack with those bulkheads dividing each bed?—Yes; they are shown on the sketch I gave in.

5173. Would that interfere with the ventilation?—Not the least.

5174. Why not?—Because there is an extracting flue directly under the bed, and another over it.

5175. You do not mean the bulkhead to go down to the ground?—No; I should recommend a space underneath each of about five inches to promote cleanliness and allow a free circulation of air.

5176. How high do you make it from the ground?—I think 5 feet 6 inches would be sufficient.

5177. As I understand you the bed is 6 feet long?—Yes.

5178. Anybody looking along could see whether a man was in bed?—Yes.

5179. But it would have the effect of dividing each man from his neighbour?—Yes; and as regards ventilation there is a flue near the floor, and corresponding admissions for the fresh air from the passage.

5180. And there are flues going out under the bed?—Yes; and I think a small bulkhead would be an improvement in barracks, as it would give a degree of privacy.

5181. What is the cost of those bulkheads?—Not much.

5182. Yours, that go right round and enclose the cell, are expensive?—They are rather expensive from being made of corrugated iron.

5183. Could you make a thing of that sort for 10s. or 1l.?—A partition of corrugated iron would probably cost about 1s. a foot super., which would be 20s. each for those which appear in the plan.

5184. In your recollection has there been any improvement in the matter of urinals, lavatories, privies, and things of that sort in the barracks?—The lavatories have been added, I think, to most barracks, and I hope the privies have been improved.

5185. There are some, I believe, which have none? That I am not aware of; it is so long since I have had anything to do with barracks.

5186. With regard to urinals, they still use urine tubs in the wards?—Yes, I believe so, in the barrack rooms.

5187. (*Sir H. K. Storks.*) How do they manage in the prisons. Is there a urine tub in each cell?—Each man has a chamber pot. In some of the cells where the men are likely to be violent, gutta percha chamber pots have been introduced.

5188. (*President.*) Are they as free from smell as crockery?—Yes; when kept clean.

5189. They are less offensive than the wooden tub?—Yes.

5190. (*Mr. J. R. Martin.*) That is the worst of all?—Yes.

5191. (*President.*) Your men are all separate in the prison?—Yes; generally all are separated at night.

5192. (*Sir H. K. Storks.*) You have never so many men in one room as in the barrack room?—Yes; at Dartmoor there are. Some are epileptic or not capable of being left alone. It is partly a hospital and partly a prison, but the principle that we endeavour

to carry out is the entire separation of prisoners at night, when they are not under effective control.

5193. (*President.*) What is your reason—take Portland.—You have to look after those men and keep them in health, to execute certain public works for the government. Other engineers build barracks to keep soldiers in perfect health to do service for the government. How is it, that in the one case a man sleeps in a fœtid atmosphere, and in the other you give him a pure one?—I do not think that the subject has been sufficiently considered in respect to the barracks. It has been lost sight of. It is the same in a private house—it is not the business of the architect or the builder to provide for ventilation; flues are provided for the smoke, and generally that is all that is considered essential. It was only when it became so indispensable to the carrying out of the Act of the 2 & 3 of Victoria, as to the separate confinement of the prisoner for long periods, that my attention was so strongly directed to it.

5194. (*Mr. J. R. Martin.*) The question was then forced upon your attention?—Yes, in this way. I was held responsible by the Secretary of State for building a prison at Pentonville, which was to be a model, and the inspector who had to certify the cells laid down the conditions respecting the amount of ventilation.

5195. (*Sir H. K. Storks.*) Is the health of the prisoners generally very good?—Yes, very good indeed.

5196. (*President.*) Are your admissions per thousand to the hospital less than in the army?—That I do not know—there are many depressing influences in imprisonment which lower the condition of a man, and render him liable to general failure of health. It is a matter of medical experience, that a prisoner sitting in a cell with little or nothing to do, requires more diet and nutriment than a man who is actively employed at labour.

5197. (*Sir H. K. Storks.*) Are you aware that in tropical climates the health of the soldiers in prison under sentence of court-martial is bad?—No, it has never been brought officially before me. The returns are all sent to the Secretary-of-State for War.

5198. (*Mr. J. R. Martin.*) Have you heard that many persons on being released from military prisons in the East Indies have come out in a state of idiocy?—I am not aware.

5199. (*President.*) You do your utmost, by diet and ventilation, and general comfort, to keep a man in health?—Yes.

5200. You trust for punishment to the most wearisome description of work?—Also to the lengthened period of confinement. Whatever be the comforts given to a man in prison, they are not valued in comparison with liberty—therefore so far all confinement operates as a punishment.

5201. The labour that you give to a soldier in a military prison is of the most wearisome description?—About three hours a day is devoted to purely penal labour. It was held to be an object to have the imprisonment as short as possible, so as not to lose the service of the soldier, and to have it as severe as was proper in order to deter others from crime.

5202. (*Mr. A. S. Stafford.*) Do you find greater or less difficulty in managing military prisoners than others?—There is but little difficulty in either case, when the men are treated justly and with due consideration. The number of prison offences will be found in the statistics of the military prisons of which a report is published every year, and they are a certain test of discipline.

5203. (*President.*) Have you greater means of enforcing discipline in military prisons than in civil prisons?—No; I think not.

5204. Have you resorted to corporal punishment?—Yes, but to a very limited extent indeed.

5205. (*Mr. A. S. Stafford.*) Is there the same proportion of corporal punishment for the military prisoner as for the civil prisoner?—I never compared the two, but I think it is less with military prisoners.

Among the convicts we have to deal with, the worst of characters, some among whom can only be subdued by force, the great body of them, however, are managed chiefly by moral means.

5206. (*President.*) Moral means and stone walls?—So far as preventing escape, stone walls are necessary.

5207. (*Sir H. K. Storks.*) Do you stop their food?—To a very trifling extent, that is one of the punishments.

5208. (*Mr. J. R. Martin.*) Any interference with their rations would tend to deteriorate their health without improving their morals?—Yes, on opening Portland, a diet which the medical men considered sufficient to keep them in health was tried, but after a few months it was found that the men could not get through their daily labour, and it was necessary to give them an extra ounce of meat and a little additional bread. At Pentonville the depression at first was so great that the medical commissioners most anxiously considered the question of diet. It is extremely liberal, and the men would fail in health if it were not.

5209. (*President.*) In the military prisons do the men come out having lost weight?—On the whole they lose weight, but they generally are discharged in good health.

5210. And fit to resume their duties?—Yes.

5211. What is their ration as compared with what they get when out of prison?—The diet is altogether a different kind to that they are accustomed to. It was considered an object so to establish it. The prison diet is chiefly composed of American corn meal made into a pudding; it is a good wholesome dinner, but not a very palatable one.

5212. (*Mr. T. Alexander.*) Do they get meat occasionally?—Only on Sunday for the first class.

5213. (*Mr. J. R. Martin.*) Is the diet varied?—No, it is a very uniform diet. The sentences at the military prisons average about 115 days. The medical officer at all times can alter the diet in any particular case, but at the end of 84 days there is a little increase allowed generally.

5214. (*President.*) You are quite satisfied that they are dieted sufficiently for health?—Yes; the diet was reduced about two years ago, from being found more than was necessary.

5215. But so far as a man's comfort is concerned he is really better provided for than in barracks?—Yes, I have no doubt that his material comforts are better provided for.

5216. How often do they wash in the prison?—Every day, and their feet once a week.

5217. How often do they bathe?—They are required by the prison rules to bathe once a week.

5218. What means of ablation have they?—In most prisons every man has a jug of water and a washing-basin in his own cell. In some there are places set apart for washing.

5219. (*Sir H. K. Storks.*) Does he bathe in a bath or tub?—In some prisons they have large baths, in which they can lie down; in others, to economize the water, and secure the object of letting each man have fresh water in his bath, a smaller kind is used, in which they sit down and wash themselves with a large square of flannel.

5220. A hip bath?—Yes.

5221.—(*Mr. T. Alexander.*) In those respects they are much better off than soldiers in barracks?—Yes, I fear they are; but personal cleanliness is, on all accounts, so important, that great attention is paid to it. I think it of importance that there should be afforded means of bathing in barracks.

5222. (*President.*) Do you propose in your plan to make any provision for quarters for married men?—We have built very largely at all the convict prisons for the warders, who are principally discharged serjeants, generally with families, and I have adopted several plans for securing them comfortable quarters.

5223. (*Mr. J. R. Martin.*) Are they in the form of lodging houses detached from the buildings?—

Colonel Joshua
Jebb, C.B.

19 June 1857.

They are all detached, in various forms suitable to the localities, and consist generally of a kitchen, scullery, and two bed-rooms.

5224. In the improved barracks, do you contemplate making quarters for the men who marry with leave?—I think it of great importance to make a proper provision for married soldiers, but I should have the quarters at a distance. The introduction of women and children into a barrack is very objectionable.

5225. (*Sir H. K. Storks.*) Would you approve of detached buildings in the rear of the barracks?—Yes, but I would have them at some distance, not less than a few hundred yards.

5226. (*President.*) Have you seen the Guards' arrangement?—I have not.

5227. Looking at the treatment of the troops that has come under your observation, what should you say is the main cause of the great excess of mortality among soldiers as compared with men of similar age in other classes of life?—There is perhaps something in the duties, that is, the exposure of a sentry at night; but I should attribute it chiefly to drunkenness, and those habits of dissipation into which they fall, and the want of ventilation in the barrack rooms.

5228. Referring to the night duty, that does not apply to the cavalry, and yet the mortality in the cavalry is considerably in excess?—The cavalry frequently sleep over the stables, and foul air is thus introduced, in addition to the want of ventilation.

5229. The same applies to the artillery, does it not?—Yes, generally speaking.

5230. With regard to drunkenness, is there more drunkenness among soldiers than among the same class of men in civil life?—Excluding desertions, almost all the crime of the army is, either directly or indirectly, traceable to drunkenness, and absence without leave, which is connected with it.

5231. (*Sir H. K. Storks.*) Do you think, judging from the number of men committed to prison, that drunkenness has increased in the army?—I believe it has to a certain extent during the last year, but it is remarkable how the proportions have varied at different stations. Some few years ago the proportion of the crime of drunkenness in Ireland was double what it was in England. In Scotland it was three times what it was in England. In looking for the cause of this distinction it is traceable, as I have understood, to the operation of the Act which facilitated the distillation of whiskey.

5232. (*Mr. J. R. Martin.*) There is this difficulty in making a comparison, that in the army you can ascertain the cause of crime to be drunkenness?—Yes.

5233. But in civil life you cannot ascertain that?—Not with the same accuracy. I think, however, that in an equal number of men there would be found more drunkenness in the army.

5234. Would it be an advantage to have at head quarters in London models and plans of the most approved barracks and hospitals, to be regarded as patterns for them, or until better plans should be discovered?—I think it would be of the greatest advantage.

5235. You use such plans and models, do you not, for military works?—Yes; the principles on which military works are generally constructed are recognised; but the application of the principle varies more than it would in a barrack.

5236. The same would apply to barrack hospitals?—I think that if a model barrack or hospital were once erected, the principle and detail of which were fully approved, there need not be any deviation from it.

5237. It would remain as an approved fact?—Yes.

5238. Had such models and plans existed it would have saved many blunders which have been committed in the erection of barracks and hospitals?—I do not

know how that may be; it is long since I have had anything to do with such works.

5239. (*President.*) You say that drunkenness you look upon as one of the largest causes of crime, and you think that drunkenness is greater in the soldier than in the same classes of men in civil life?—Yes, I think so.

5240. You take every offence of drunkenness committed by the soldier more or less coming under the cognizance of the superior authorities, but that is not the case in civil life?—No, it is not; but I judge from what one sees about the streets of Chatham, Portsmouth, and other places.

5241. Do you think that if every man that you saw drunk was dressed as conspicuously as the soldier you would not see as many?—I think not. You may go through Chatham or Portsmouth at all hours of the day and night and you will see but few civilians drunk.

5242. On a Saturday night, in a rural district, do you not think that as many men go home drunk?—Yes; the beer-shop undoubtedly has its baneful attractions for that class.

5243. And those are the classes, are they not, from which the soldier comes?—They are.

5244. Suppose that there was such a mass of drunkenness in the army, would it not be shown in the causes of mortality in the army; would not they die more of liver diseases and not of pulmonary diseases?—I cannot decide that point; but I cannot doubt that drunkenness has a very prejudicial influence upon the health of the army.

5245. (*Mr. A. S. Stafford.*) The proportion of military at Chatham is very great compared with the civil inhabitants of the same age and rank in life?—I think the civil inhabitants would out-number the soldiers. There is a large number in the dockyards, independent of the inhabitants of those towns. I scarcely think that the garrison at Chatham would out-number the inhabitants.

5246. (*President.*) You make your comparison with the whole population of all ages in civil life; you do not make your comparison with men of the same class, adult males from 18 to 38?—My opinion is rather formed upon the general admission of all commanding officers than from my own observation; it is some time since I have been closely connected with the service.

5247. Commanding officers are the men who feel most interested in whatever may be the causes of crime; but if you went to the clergyman of the parish would he not tell you the same thing, that the bane of his parish was drunkenness?—I think he might.

5248. Putting that cause aside, would you put next to that the want of ventilation?—The want of ventilation cannot fail to have a prejudicial effect. A man is in his barrack-room from eight to ten hours out of the twenty-four, and that is a large proportion of his time. Any one who has to go round when the men are in bed can speak most painfully to the foul state of the atmosphere in any barrack room; it is quite unbearable.

5249. Your remedy would be in improving the barrack accommodation?—That is one very important point. I believe that making the soldier comfortable in his quarters is indispensable as the basis of all the training by which the moral standard of the army may be raised.

5250. You include in that facilities for reading rooms, and so on?—All that has been done in this direction is admirable; but I think a man would be more inclined to read in his room if he had books and had facilities for doing so, than go to a separate room provided for the purpose.

5251. (*Sir J. Clark.*) You think that the moral effect would be equal to the physical?—Yes, the more the condition of the soldier is improved, and the more the public become satisfied that he is well cared for in

every respect, the sooner will a better class of recruits present themselves.

5252. (*President.*) They would be the same class, but they would be the best?—Yes, the best of the class.

5253. (*Mr. J. K. Martin.*) The want of means of recreation and amusement is also a well-founded complaint?—The means of recreation have been much attended to of late years. Racket courts have been erected in many barracks, foot-ball, cricket, and other games have been encouraged. These efforts, and the instruction of the soldier, will tend to raise the moral standard of the army; but I would now particularly allude to increased instruction in moral and religious duties. I have always been greatly struck with the deficiency in the amount of spiritual instruction which is afforded to the army.

5254. (*Sir H. K. Storks.*) Have you not been very much struck with the readiness of the soldier to profit by it?—That has always shown itself where any means have been afforded to them. The subject has forced itself upon my attention particularly, from being aware of the great care taken by the legislature and all connected with prisoners, to afford to all criminals ample instruction in moral and religious duties. Magistrates are compelled by law to appoint to the smallest prison a chaplain, who shall devote the whole of his time to the prisoners, and to a considerable extent the range of his duties are laid down by an Act of the 4th Geo. 4. cap. 64. In the 30th section it is provided that every chaplain appointed to a gaol, "shall, on every Sunday, and on Christmas-day, and Good Friday, perform the appointed morning and evening services of the Church of England, and preach at such time or times, between the hours of nine and five in the day, as shall be required by the rules and regulations to be made as directed by this Act; and shall catechise and instruct such prisoners as may be willing to receive instruction, and shall likewise visit the prison on such other days, and perform such other duties as shall be required by the rules and regulations to be made as directed by this Act, and shall administer the holy sacrament of the Lord's supper to such prisoners as shall be desirous, and such chaplain may deem to be in a proper state of mind to receive the same; and such chaplain shall also frequently visit every room and cell in the prison occupied by prisoners, and shall direct such books to be distributed and read, and such lessons to be taught in such prison, as he may deem proper for the religious and moral instruction of the prisoners therein."

5255. (*President.*) Is it fair to argue from the number of chaplains employed per head in prisons to the number that are requisite for men in freedom?—Perhaps not, but I would illustrate my meaning by reference to the staff for instruction in some of the Government prisons. At Portland, with 1520 convicts, there are 2 chaplains, 1 scripture reader, and 6 schoolmasters; at Pentonville, with 560 prisoners, there are 2 chaplains, and 3 schoolmasters, &c., I can state that the time of all is most fully and most usefully applied. In my view the defect is not only in the limited number of army chaplains, but in their being appointed to garrisons, and not specially to regiments. They cannot under such circumstances, have the same amount of individual communication with the men which we find of such great importance among convicts.

5256. Still the number that you quote in the prisons is greater than the number given by the parochial system for the general population?—It undoubtedly is so, but prisoners are all adults, and the census takes in the population of all ages.

5257. (*Sir H. K. Storks.*) It is supposed that men in gaol require more spiritual consolation, is it not?—Yes; but I think it will appear there does not exist sufficient provision in the army to ensure any great amount of instruction. If a chaplain were appointed to a particular regiment, he would go among the men, become interested in their welfare, give them advice;

and most certainly, if he were a judicious and earnest man, would exercise a great influence for good.

5258. (*Mr. A. S. Stafford.*) You do not think that the relation between the chaplain and the soldier is satisfactory in the army?—I think not.

5259. (*President.*) You think that it is not intimate enough?—That has long been my opinion.

5260. (*Mr. T. Alexander.*) Is there not great room for improvement as to the kitchens in the barracks?—I think so.

5261. Do you not think that opportunities ought to be given to the men to vary their diet by roasting and baking?—There might be an established variety of diet on certain days; but it would lead to irregularities to allow the men to do it themselves; it should be settled by regulation or order.

5262. Now they cannot do it?—It would be a great advantage to afford facilities for a variety of diet, and would conduce to health, I think.

5263. (*President.*) You mentioned that you would have workshops attached to the barracks for the soldiers?—I think it would be found of advantage, for the more the soldier is usefully employed, the better he would be for it in almost all respects.

5264. He would gain when he left the army, because he had learnt a trade?—Yes; but chiefly he would gain in having acquired habits of industry instead of habits of idleness.

5265. Could he practise the trade for the good of the service?—Certainly.

5266. In what way?—A great proportion of the repairs of the barracks might be done by military artificers, if carpenters' and other workshops were attached to barracks.

5267. (*Sir H. K. Storks.*) But there would not be men enough to do the duty?—The working parties would not be numerous, and might be taken by roster.

5268. You must have parades to drill the men?—Yes, they would not be excused from some of the parades; but when a man was once fully drilled, he might go out with his regiment once or twice a week, and at other times be usefully employed as a carpenter or smith.

5269. (*President.*) In general hospitals there is great complaint as to the difficulty of getting small repairs executed, owing to the necessity of corresponding with other departments to get authority for them. Would it be a saving to have attached to a hospital, two or three men, carpenters, to execute the small current works of the hospital?—I think it would be found convenient for small repairs.

5270. In your prisons what do you do?—A foreman of works is attached to each prison, who has one or two artificers under him. He from time to time submits requisitions for the repairs that are necessary, together with a demand for the materials that are required; those requisitions being approved, he obtains the materials from a contractor, and executes the repairs with the men under him; in some cases obtaining an additional hand.

5271. If the work passes his means, then he makes a contract?—Annual contracts are entered into by me.

5272. For small works are you satisfied that they can be executed cheaper in that way than if a separate contract was made for them?—Yes, if the artificers are good workmen, and properly looked after by the foreman. It is his duty to see that their time is properly applied.

5273. (*Mr. J. R. Martin.*) In regard to the treatment of the soldier, you are of opinion that he should be allowed to do for himself everything that he can do without injury to his health or discipline in pursuing his trade for his own benefit?—No, not for his own benefit, he should be employed for the benefit of the public and be paid for it. It would lead to much irregularity to allow of their going to work for other people on their own account; that would demoralize the soldier.

Colonel Joshua
Jebb, C.B.

19 June 1857.

Colonel Joshua
Jebb, C.B.

19 June 1857.

5274. (*President.*) You would convert a certain number of men into something like sappers?—It would be an approximation to the system pursued in regard to the training and employment of the engineers.

5275. (*Mr. T. Alexander.*) With a view to render a battalion complete in itself?—Yes; if the men were usefully employed, to a certain extent, it would have a good effect, and they would acquire industrious habits.

The witness withdrew.

Sir John Hall,
K.C.B.

19 June 1857.

Sir JOHN HALL, K.C.B., examined.

5276. (*President.*) At what time did you join the army in the East as principal medical officer?—In June 1854.

5277. You had been, I believe, already in Bulgaria before you joined the army in the Crimea?—When I joined the army it was embarking for Varna. The light division had gone; the others were still at Scutari and at Gallipoli.

5278. What were the medical arrangements when you arrived in Bulgaria as to the distribution of field equipments, and so on?—A certain proportion of equipment had been given to the different regiments when they went up to Varna, and they were establishing a general hospital at Scutari when I arrived in Turkey.

5279. (*Sir H. K. Storks.*) Where did you join?—At Scutari, on the 17th of June, 1854.

5280. Did you join Lord Raglan's head-quarters?—Yes; he was there then.

5281. (*President.*) Was there a general hospital at Varna?—No, it had not been opened; it was opened afterwards, when I went up there.

5282. What arrangements did you make in the way of provision for the sick?—At Varna one half of a large Turkish barrack was given over to the English, and the other half was given over to the French; and we took measures to get it cleaned and ventilated. The stores were all accumulated there; part of the stores I found lying on the wharf when I landed, marked with the hospital mark, without anybody knowing anything about them.

5283. Did you find a sufficient supply of medicine and medical comforts at that time?—Yes.

5284. From the time that you arrived in Bulgaria till the departure of the army on the expedition, what did you consider to be the deficiencies in the medical preparations,—had you men enough then?—There were many difficulties. We had no ambulance. We started on the campaign without the necessary machinery for a general hospital. We had no orderlies nor any other servants. We were obliged to get them as we could from the ranks, and that was done with great difficulty. They were quite ignorant of everything connected with a hospital, and when we had got them a little initiated, the commanding officers very frequently removed them, and we had the same process to go over again with others.

5285. That has been remedied by the creation since that time of a permanent hospital corps?—Yes; at first they sent us out some ambulance men, old drunken pensioners that we could make nothing of.

5286. They were not sent out to be used as hospital orderlies, were they?—Yes, part of them as hospital orderlies, and the others were to be employed as drivers for the waggons. The order that came out was, that they were to be employed in the hospitals.

5287. Will you state what you consider to be the proper field equipment of a battalion on active service?—I think each battalion ought to have a certain equipment; it must necessarily be limited if the army is moving. The army before Sebastopol was exceptional; but I think it would not be advisable for a regiment to have an equipment for more than 20 men. They would require one cart to carry what comforts they wanted, and about 20 cork mattresses and blankets. They ought also to have a kind of Irish car, to pick up the men who drop behind, and to carry them on the line of march; and that should be pro-

vided with 10 or 12 canvas bearers in case of having wounded men. They ought also to have a certain proportion of comforts, such as wine, brandy, arrow-root, and essence of beef, &c. (*Vide App. No. XLIX.*)

5288. Do you think that would be a sufficient supply in point of number?—Yes; there ought to be with each division a divisional establishment.

5289. There is no brigade establishment?—If a brigade were detached you would send an establishment with it.

5290. You have the general hospitals in the rear if you move?—Yes; and you would have your regimental establishments, which must be limited; and your divisional establishments, which would maintain the sick, perhaps, for a day or two longer; then your general hospitals in the rear, to which the men must be sent by every opportunity.

5291. (*Sir H. K. Storks.*) Was not that course adopted at the Cape of Good Hope?—Yes, we used there a very simple plan; we got a cartel, an elastic platform on which the Boer's wives travel in their waggons, put on the top of the load in a certain number of commissariat long waggons, and when the waggons were emptied the cartel was slung, and formed an efficient and inexpensive ambulance wagon.

5292. (*Mr. J. R. Martin.*) You would also have a divisional hospital, but more for temporary purposes?—That must move too. You would have a divisional hospital perhaps for 150 men.

5293. That would be eventually subservient to the purposes of the general hospital?—Yes; you must send the men to the rear; but I think that proper ambulance transport ought always to be with the army for about five per cent., and that, with the assistance of the general transport, would be quite sufficient.

5294. (*Sir J. Clark.*) What plan did you adopt for conveying the sick from the front at Sebastopol to Balaklava?—Twelve waggons arrived from Varna on the 12th of October, and they were sufficient, so long as the roads remained good, to relieve the hospitals in front and take the sick down to Balaklava.

5295. (*President.*) Were they not too heavy?—Yes; when the wet weather set in, but that was not peculiar to them, because the ammunition waggons could not travel without many horses, owing to the deep and tenacious nature of the soil.

5296. It was not so much a fault in the construction of the waggons?—No; but I think it was too heavy for general purposes. If I had any voice in equipping the army I would not have them made so heavy. Afterwards when the waggons broke down the French lent us their ambulance mules, and I recommended that the cavalry horses should be employed as a last resource.

5297. (*Sir J. Clark.*) Do you think that the French ambulance system is superior to ours?—I think that the litier and the cacolet are very good; they can travel very well where wheeled carriages cannot.

5298. Those that we have now are very heavy, are they not?—Yes.

5299. Have they been at all improved?—Yes; it has been attempted to improve them, but I think that the alteration is rather a disadvantage. In place of having what the French have for the relief of a seriously wounded man, our litier is made a fixture to the pack saddle, and it is very difficult to lift a man up to it. The French one unbooks and they put it down on the ground, and two men raise up the wounded

man and hook it to the saddle. I think the alteration in ours is not an improvement.

5300. (*Mr. T. Alexander.*) And that would also prevent you from carrying up supplies?—Yes; you must take the litter off for that.

5301. (*Mr. J. R. Martin.*) In the divisional hospitals the men would be attended by regimental surgeons, would they not?—You would have either a staff surgeon, or a deputy inspector in charge of a divisional hospital; and it would be, of course, attended by the medical men from the different regiments of the division.

5302. (*Dr. A. Smith.*) Did not the men who were severely wounded complain much of the jolting of the cacolets?—Yes; wounded men will complain of every kind of conveyance.

5303. Did they not complain more of the litters than of the waggons?—No. You can hardly make any springs that will be quite easy; the best springs were those of Fuller's patent that came out afterwards, but whether they would have stood the wear and tear of service or not is doubtful; these waggons had India rubber springs.

5304. (*Mr. A. S. Stafford.*) Nothing could be worse than the arabas?—No; we did not use them much.

5305. (*Dr. A. Smith.*) Although the litter is objectionable in some respects, yet under the circumstances in which your men were placed was it not the best conveyance?—Yes; you can use it where wheeled carriages cannot go; you can take it on the field and get your men away. The canvas bearer is easier, but you cannot transport men any distance by it.

5306. You would not trust to either, exclusively?—No; you would require waggons.

5307. Do you like four wheels, or two best?—Four decidedly; we had two-wheeled carts, and they were upset nearly every time they went out, owing to the negligence or inexperience of the drivers; and Mr. Guthrie devised a plan of slinging a man to the roof, which would have been dangerous.

5308. (*President.*) As the general hospitals are formed at the base of operations, and as, generally speaking, with us, that would be on the sea coast, what should be the regulations under which those hospitals should be formed?—That would rest with the principal medical officer; he would look out for the most eligible buildings he could get, free from sanitary defects.

5309. What powers would he have, as to adding to a building, or altering it, which might be necessary, to some extent?—Hitherto that power has been very much limited. You must go such a round-about way, writing to the quartermaster-general, and then the quartermaster-general writing to the engineer department.

5310. Do you think that there might be a shorter way of doing these things?—If authority was given to the principal medical officer to communicate directly with the engineer department, after submitting the matter to the Commander-in-Chief, I think that would be better.

5311. But the Commander-in-Chief might be miles away, and days away?—It would hardly be so where you are going to establish a general hospital; you would not commence a campaign without some provision of that kind ready made.

5312. Would it not be a relief to head-quarters, both to the commanding officer and the principal medical officer, if the general hospital, at the base of operations, were taken from under their charge and put upon the footing of the establishment at Chatham, and were made a general hospital belonging to England?—I should think not; suppose you had to move it, your operations may alter, as ours did, and we had to change the base of our operations.

5313. (*Mr. J. R. Martin.*) In the Peninsula the army was stationary?—Because they were on one line of operations, but you might change your base of operations altogether.

5314. (*President.*) Scutari might have been said to be the base of operations, to a great degree?—Yes; it began at Gallipoli; then it went to Scutari; and afterwards it was supposed that our base would be at Varna.

5315. At Scutari, the hospitals were far beyond your reach, or Lord Raglan's reach?—Yes; but still they were under his direct command; the commandant was under his command.

5316. He might have been glad to get rid of the responsibility of a hospital that he could know nothing about?—Yes.

5317. (*Sir H. K. Storks.*) During the last 18 months of the army being in the east, no reference was ever made to Lord Raglan, or to the Commander-in-Chief of the forces?—I do not know that.

5318. (*Mr. J. R. Martin.*) As in most cases of British expeditions the base of operations is the sea-board, do you not think that it would be an advantage to empty the large general hospitals, such as those which the Duke of Wellington established, and send the men off in ships, as often as they could be sent, and so to obviate the great evils that were then complained of, as in all our wars, the accumulation of men in general hospitals?—There is no doubt of it; but that system was virtually adopted in the Crimea; we latterly sent the men home every week.

5319. (*President.*) With regard to all the machinery necessary for the selection of a hospital, do you think that is satisfactory, and that the principal medical officer is the person who selects the site?—Yes, he gets permission of course; the general officer sanctions it.

5320. For water supply and alterations in buildings, the change that you would suggest is this, that the principal medical officer should be put in more immediate communication with the engineer?—Yes, that he should certainly have more direct means of getting a thing done. I have written numerous letters of one kind or another when I have wanted particular things done. I had first to write to General Airey, and then he had to write to the engineer.

5321. Still there must be the sanction of the Commander-in-Chief?—Yes, the Commander-in-Chief must be consulted, and give his sanction. The principal medical officer would communicate with the quartermaster-general, according to the present system, and he would take the Commander-in-Chief's pleasure upon the matter.

5322. Having obtained that, then you think he ought to deal directly with the engineer?—Yes, that would be an improvement upon the present system; for according to the routine of the service, certain things must go through certain channels.

5323. Practically are the medical officers consulted on such matters as the selection of sites for hospitals, and sites for camps?—Not always, indeed very seldom.

5324. Is it a matter of regulation that they should be so consulted?—I think not, but I think it ought to be so.

5325. (*Sir H. K. Storks.*) You have been in the field elsewhere?—Yes.

5326. Were you ever consulted about the site of a camp?—Yes, always.

5327. (*Mr. J. R. Martin.*) Where was that?—At the Cape of Good Hope. I have been in India, and when I was there they were building barracks, and there was not a single thing done without consulting me. They were going to build a large barrack at Poonah, and every plan was submitted to me first.

5328. But it is nowhere a matter of standing order or regulation?—I do not know, but at that time there was no alteration of any kind, or anything connected with the Queen's troops, where the health and the comfort of the men were concerned, that Colonel Holland, quartermaster-general of the Bombay army, did not consult me about.

5329. (*Sir H. K. Storks.*) At the Cape of Good Hope you were always consulted?—Yes.

*Sir John Hall,
K.C.B.*

19 June 1857.

*Sir John Hall,
K.C.B.*

19 June 1857.

5330. (*Sir J. Clark.*) Were you consulted with regard to the various influences that might affect the health of the army in Bulgaria?—No, but I made strong remonstrances myself; I visited the different camps, I found that some of them were very objectionably placed; and in speaking to Lord Raglan upon the subject, he begged me to write to him upon it, which I did.

5331. (*President.*) Could you put in any statement of that kind?—Yes.

5332. (*Mr. J. R. Martin.*) Was any change made in consequence of your representation?—It was submitted for the consideration of the general officers, and Lord Raglan showed me the answers that he had received, and certainly it was not approved of.

5333. You mean the general officers of divisions?—Yes.

5334. (*President.*) They did not believe in the danger that you pointed out?—No; they scouted it.

5335. (*Sir J. Clark.*) Do you not consider it of the greatest importance to the efficiency of an army in the field that good sites should be selected for the camps?—Most unquestionably.

5336. Did it not happen, after the battle of the Alma, that our troops were encamped on ground which the Russians had left in a filthy state?—Yes; but that was a matter of necessity, and accidental; the latrines were very bad.

5337. If a medical man had been consulted, would he not have tried to get them removed?—A medical man ought to be consulted in such matters.

5338. (*President.*) You thought it your duty as principal medical officer to make the remonstrances that you have referred to?—Yes.

5339. Do you suppose that the divisional medical officers feel that their position gives them authority to do so?—They ought certainly to point out to the general officer commanding anything that appears to them objectionable. I think that the camp at Devna was the worst selected camp that I ever saw.

5340. Practically do you think that they do so or not?—Some do, and some do not.

5341. Do you suppose that the reason of that is that they are not very well received?—Perhaps so; military men do not often attend to the recommendations of medical officers.

5342. (*Sir H. K. Storks.*) But that is no reason why they should not make a representation?—No.

5343. (*President.*) Ought it not to be made a matter of regulation that the medical officer should make such representations in writing?—Yes; I think that would be a very good regulation, and that the general officer should take the opinion of the principal medical officer in writing or otherwise. It would be better for his own satisfaction to write, and then the general officer might adopt it or not. There might be strategic reasons why he did not.

5344. Would not the fact of the representation being made in writing give greater security for its adoption if it were a suitable recommendation?—Yes; I recollect that they commenced building huts just going into Balaklava, which I protested against in the strongest way I could.

5345. (*Mr. A. S. Stafford.*) Why?—Because they were put between a perpendicular rock and a graveyard just abandoned. This was just at the entrance into Balaklava, on the right-hand side, and when they commenced the huts I wrote a letter to General Airey and protested against it, but they were proceeded with. The site was most objectionable, for it was just at the head of the harbour close to a Turkish burial-ground, filled and actually steaming with the dead, which were imperfectly covered, and just behind it was a perpendicular rock; and the consequence was that shortly after, it was occupied by the Coldstream Guards, and the men had spotted typhus fever, and I then insisted upon its being abandoned.

5346. Was that on the right of the road?—No; on the left as you went out of Balaklava under the rock.

5347. (*Sir J. Clark.*) Might not the health of the army have been much more preserved than it was in Bulgaria if the medical men had been consulted?—I should say so; I would have advised, for instance, that the men should have been encamped on the Galata heights instead of on the banks of the lake. Where they were encamped, it was said, had formed the pest burial-ground of the Russians in 1828 and 1829.

5348. (*Mr. J. R. Martin.*) There was plenty of room on the table lands on the higher grounds?—Yes.

5349. (*Sir J. Clark.*) Is it your opinion that the foundation of the bad health suffered by the men in the Crimea was laid when the army was in Bulgaria?—The health of the men was very much shaken in Bulgaria; we had cholera there.

5350. (*Mr. J. R. Martin.*) And fever and diarrhoea?—Not so much fever, but a good deal of diarrhoea; some of the camps were very injudiciously chosen.

5351. (*President.*) The men were very much weakened in health while in Bulgaria?—Yes; and they were unable to undergo any fatigue. We had no long marches in the Crimea. The longest march was not more than 12 miles.

5352. Before the troops embarked they showed great weakness in short marches?—Yes.

5353. (*Mr. J. R. Martin.*) They were unable to carry their knapsacks, were they not?—Yes.

5354. (*Sir H. K. Storks.*) Was the weather very hot?—No; it was in the beginning of September.

5355. But the weather had been very hot all the summer?—Yes.

5356. (*Mr. A. S. Stafford.*) Are you of opinion that it is necessary that the principal medical officer attached to an army on service should have early notice of all the intended movements of that army?—Most unquestionably.

5357. Was formal notice given to you on all occasions during the war, to enable you to make all the necessary medical arrangements with satisfaction to yourself and benefit to the sick?—No; I received no intelligence at all that the army was about to embark from Varna. The ships were fitted up, and some had two doctors and some had three, and some had none; some had medicines and some had none. The first intimation that I had of it was from the different divisions bringing in their sick; and I was called upon at once to provide for about 2,000 sick.

5358. (*President.*) But that was at a moment, was it not, when it was desirable that the secret of the expedition should be kept to the very last moment?—I ought not to have been kept in ignorance of the intended movement, being the principal medical officer. It was perfectly well known, and had been the talk in the camp for weeks before. Take, as another instance, the expedition to Kinburn. I got notification of that only the night before it sailed to make my medical arrangements for it, and to appoint a staff of medical officers to accompany an expedition of 5,000 men; I got the official information on the morning of the day they were ordered to embark; and it was just the same when the expedition went to Kertsch.

5359. (*Sir H. K. Storks.*) Official notice of the expedition to Kinburn was given to you the morning that they sailed?—The evening before it embarked, official notice was given to me; the following morning I heard of it in the camp, but that is not the proper channel through which the information should have come to me.

5360. (*Mr. J. R. Martin.*) It was not information upon which you could have acted?—No, but I did what was necessary to be done on it.

5361. (*Sir J. Clark.*) How often did you see the Commander-in-Chief during the time you were in Bulgaria?—Very frequently.

5362. (*Mr. J. R. Martin.*) Did you communicate with him officially?—Yes, particularly after the cholera broke out, when I saw him nearly every day.

5363. (*Sir J. Clark.*) If you had had information of the sailing of the expedition for the Crimea, you could have made better preparations?—Yes, the inconvenience was in the different transports. I made application for the conveyance of 400 tons of medical stores, which were necessary for the expedition, and I think I got four days' notice from the quartermaster-general's department of the ship that was to take them. They had to be brought through the narrow streets of Varna in small country carts, and there were no boats ready to embark them. If Lord Raglan had not told me the name of the vessel, it would have been quite impossible to get them on board. Half the things were on board when I received the notification from the quartermaster-general of the name of the ship.

5364. (*President.*) Had you waggons at Varna?—Yes, 40.

5365. But not sea transport to carry them?—Yes.

5366. (*Mr. A. S. Stafford.*) Then why were they left behind?—I do not know; I spoke to Lord Raglan repeatedly about ambulance conveyance, and begged that he would interfere; he quite agreed with me, as he saw the propriety of it, and an order was given to ship 12 waggons complete on board the "London" transport, but some one, immediately his Lordship had sailed, took upon himself to re-land them, and in doing so the mules and harness were all lost. I think 10 of the waggons were got on shore, and the two that remained came to the Crimea without either mules or harness.

5367. (*Sir J. Clark.*) How were the mules lost?—The weather was boisterous, and they were all drowned in landing, and their harness was lost. Two waggons remained that could not be got on shore.

5368. (*Mr. J. R. Martin.*) It must have been an influential staff officer who gave the order, for no other order would have been obeyed?—I fancy so; Lord Raglan was not there.

5369. (*President.*) But he had given you an order?—Yes; he had ordered them to be embarked.

5370. (*Sir J. Clark.*) What were the diseases that you anticipated when the army arrived in the Crimea?—There was nothing unhealthy in the site of the camp in the Crimea; it was without exception the best site that could have been selected.

5371. Were you not a little afraid of scurvy when the army was put on salt provisions?—That was an after consideration.

5372. (*President.*) Had you a plentiful supply of fresh meat at first?—Yes; there were gardens, and the men got vegetables out of the gardens; and there were plenty of grapes in the vineyards when we first went there.

5373. When scurvy did appear, and when the army were on salt provisions, did you represent to the Commander-in-Chief the necessity of procuring fresh provisions?—Yes, over and over again; I put in numerous letters; I recommended that lime juice should be provided, and in October it was provided and issued to the hospitals.

5374. But no fresh meat was provided?—It could not be obtained when the winter set in, but the necessity for it was represented over and over again.

5375. Do you not believe that such a supply could have been obtained at the time?—That is a question I cannot answer, but I recommended that fresh vegetables should be got, if possible, at whatever cost.

5376. Could you put in a paper containing any representations as to the diet, and so on?—Yes.

5377. (*Sir J. Clark.*) Are you aware that raw coffee was served to the army?—Yes.

5378. Did you represent the inutility of the raw coffee, and the impossibility of the men using it?—I did not, for raw coffee was served out to the men at the Cape.

5379. (*Sir H. K. Storks.*) But you had plenty of fuel at the Cape?—Yes; but sometimes it was cow-dung.

5380. (*Sir J. Clark.*) Might you not have inquired whether tea was in store at the time?—Yes, and it was recommended by a committee of which I was president to be issued afterwards, alternately with coffee.

5381. Were the sickness and mortality reported to you by the other officers regularly?—Every morning.

5382. Did you recommend, during the last sickness, that the diet of the men should be improved?—Yes.

5383. Was that attended to?—As far as it could be.

5384. Were you able to inspect the state of the camps frequently?—I was in some part of the camp every day, and I made a periodical inspection of the whole; but I was out from morning to night, every day, either getting supplies down at Balaklava, or visiting some part of the camp.

5385. (*President.*) I see in an answer made in the appendix to Sir John McNeill's report, that you say you were extremely overdone by the enormous amount of returns that you had to make out?—I had a great deal of correspondence, and the clerks that I had were not very good; somebody must write, and I very often had to write all night.

5386. Do you think that the system of writing has been carried to too great an extent?—In all services there is a certain amount of writing, you cannot do without it.

5387. Do you not suppose that in the last forty years that has been much increased?—It has increased of late; particularly in the Crimea. Everybody there who wanted to speak out wrote. I received a hundred letters that I need not have received; but I had to answer them all.

5388. But I mean official correspondence, which by the regulations of the Government is rendered necessary, has not that very much increased? Do you not think that the amount of writing and work to be done now by the principal medical officer is very much larger than in the time of the Duke of Wellington's campaigns?—Not much, I think. When I went to the Crimea, in order to obviate the difficulty of case keeping, I issued a tabulated form to simplify matters. I think it necessary that there should be some record of the sickness, and by that it might be done with very little trouble.

5389. Would not that same simple plan which was found sufficient for active service be also sufficient for camps and cantonments?—Yes; you would have a much more accurate account so far as drawing any conclusions from the nature of the disease goes; you would have a tabulated form, in which you could put each class by itself, and you could at once see the bearing of any particular disease.

5390. Has it not been matter of complaint in the medical department of the army for many years that you are overlaid by returns?—Complaints have been made in the army; but you must have some record. You might, I dare say, modify the returns.

5391. You would not object to any plan that would go to simplify them?—No.

5392. (*Mr. A. S. Stafford.*) Do you think that on the whole they are satisfactory?—Some might be abolished I think.

5393. Do you think your position a satisfactory one in the field as principal medical officer, or have you any suggestions to make as to any alteration that you think ought to be made in the event of any future war?—I think one of the greatest improvements would be, that the principal medical officer should have due notice of all movements, and that he should have control over the arrangements; that a supply of carriages, which I believe was to have been the case, should be placed at his disposal, and that his requisition should be considered sufficient, for land transport.

5394. (*Mr. J. R. Martin.*) An amount of independent action which he does not now possess?—Yes.

5395. (*President.*) What was the arrangement made with the Land Transport Corps. Did you send

*Sir John Hall,
K.C.B.*

19 June 185

Sir John Hall,
K.C.B.

19 June 1857.

a requisition each time that you wanted conveyance, or was there a permanent number of horses and men appropriated to you?—When first the waggons came out in October 1854, they were distributed to the different divisions; but there were only twelve, I believe, and from want of attention the mules all died, or they became ineffective afterwards. When the Land Transport Corps was established, the ambulance for the sick was concentrated in one place, and orders were given by the adjutant-general. A representation was made. I recommended that the director-general of the Land Transport should be ordered to comply with the demands of the principal medical officers of divisions; and out of that arose an arrangement by which a certain proportion of cattle was put at their disposal. I do not know that in the working of the plan adopted in the Crimea, any obstruction or difficulty arose; but with an army moving in the field each division should have its own transport.

5396. Do you understand that that is so ruled?—I was called upon in March 1855 to give in an estimate of the number of mules and carriages that would be necessary for the army then in the field, and it would have been acted upon; a certain proportion of carriage would have been allotted to each regiment and division.

5397. Beyond these points you have no general suggestions to make, further than that the principal medical officer should always be consulted, and that he should be acquainted with the future movements of the army?—Just so.

5398. And that he should be consulted as to the sites of camps?—Yes.

5399. And upon the same principle the junior officers ought to be consulted by the generals of divisions?—Yes.

5400. They are bound to make a representation to them as to everything going wrong, or to you?—Yes; if there is any difficulty, to me, and I should lay it before the Commander-in-Chief.

5401. It would be the duty of those officers to make a representation to you of any deficiency under which the troops were suffering?—Yes, and that would be immediately laid before the Commander-in-Chief.

5402. It would be a dereliction of duty on the part of an officer who was aware of any deficiency if he did not represent it to you?—Yes.

5403. Therefore when a representation is made to you it does not follow that a man merely to keep himself safe should do it, but it is his duty to make the representation?—Yes, certainly.

5404. (*Mr. A. S. Stafford.*) What is your opinion of the civil hospitals that were established at Smyrna and Renkioi?—I think that they were very expensive, and that they were of no use to us.

5405. Do you know the number of patients that were admitted to them?—Yes; I believe between the two about 2,324.

5406. Have you any idea what the cost was?—I think the pay alone was about 48,000*l.* a year.

5407. Why were they of no use?—Because when they were built we had upwards of 3,000 vacant beds in our own hospitals.

5408. The sickness had diminished before the establishment was completed?—Yes; and besides, both of them were out of the way for us. I advised that a hospital should be built at Sinope.

5409. If the war had continued, and the sickness had increased, then they would have been valuable, would they not?—They were too far away.

5410. Still they would have been better than nothing if the sickness had been increasing?—Yes.

5411. (*Dr. A. Smith.*) Besides the sickness decreasing, we were always adding to the number of hospitals for the sick?—Yes, we were. In the Crimea we were getting our own establishment, and the men would have been better in our own establishment. They were better at the Castle, and at St. George's Monastery, than anywhere else.

5412. (*Mr. A. S. Stafford.*) Then why were they sent down to Renkioi?—Because I was ordered to send them down.

5413. What proportion did you send down?—I was ordered to send the patients down to the civil hospital. At that time I had upwards of 3,000 vacant beds.

5414. (*President.*) You were not in want of medical officers?—The medical officers got sick, but we had a very fair proportion; but a great number got sick and went away, and we were occasionally embarrassed for a time.

5415. Were not the medical officers reduced at one time to something like half their original number?—No, I think not. I think the highest proportion was about 30 per cent. of sick and absent.

5416. The establishment being at the rate of 100, if it fell to 75, it was important to make it up from the civil surgeons?—It was not a permanent deficiency, it was mostly from the casualties of sickness.

5417. (*Sir H. K. Storks.*) Still there were 30 per cent. off duty?—Yes; but the civil hospitals were no relief to us in that respect. The work was done in the field; and the proof is, that out of about 218,952 admissions into hospital, only 2,324 went into the civil hospitals.

5418. Had you not some assistance from civil medical officers in the field?—Yes; some came there for practice. They volunteered for the purpose of seeing surgical practice.

5419. (*Sir J. Clark.*) If those civil hospitals had been in readiness 12 months before, they would have been of much use to you?—I do not see that.

5420. As you were deficient in military hospitals, would not a civil hospital have been useful to you?—Yes, it would have been if it had been there, but it was not there till we had as many hospitals of our own as we could ever require.

5421. (*Mr. J. R. Martin.*) In the event of a foreign expedition, should you not conceive that a reserved corps of medical officers should always be in readiness?—You would have a certain establishment of medical men, and then you would calculate upon a certain amount of sickness. We were unfortunately filled up with young men from the schools.

5422. (*President.*) Why were they such young men?—Because the service establishment had been reduced. The medical establishment had been reduced so low before the war, that when there was a great call for medical officers you had not got them.

5423. That being the case, therefore, the men that you got being so young, that was an additional reason for government trying to recruit the medical corps from other branches of the profession, and to get men of more experience?—I do not think they did that much.

5424. There were some men of some experience who went out to Smyrna?—There were some who went out there that had not that experience that their pay would entitle them to have. If you pay a man largely, you expect that he is a man of standing in his profession.

5425. (*Mr. A. S. Stafford.*) And certainly some of those gentlemen were men of standing and experience?—Some were not.

5426. (*President.*) You have spoken of the Land Transport, did you find any difficulty in the relations which existed between the purveyor and the commissariat in supplying your hospitals, or do you think that it would be better for the commissariat to supply the hospitals instead of the purveyor?—They do supply bread and meat; but you might very easily have a hospital commissariat—it would be the same thing under another name.

5427. (*Mr. J. R. Martin.*) Would it not simplify the arrangements that it should be so?—I think so.

5428. (*President.*) How would it simplify the arrangements?—Because you now draw from the commissariat bread and meat, and it would save accounting between the two departments.

5429. Are you satisfied with the relation that subsists between the purveyor and the medical officer?—He ought to be entirely under the medical officer, as he was in the Crimea. Mr. Ward came out, under an impression that he belonged to the War Office, and there was utter confusion. The service could not have been carried on if it had not been changed.

5430. That was put an end to?—Yes, but until I got out Mr. Fitzgerald I had trouble without end.

5431. (*Mr. J. R. Martin.*) Has that been put an end to by regulation?—No.

5432. It ought to be so?—Yes.

5433. (*President.*) Was there not a regulation sent out to the Crimea in the autumn of 1854, to the effect that the purveyor was to obey every order of the medical man?—I believe so. The greater part of those instructions were drawn up by me and submitted to Lord Raglan, when the purveyors said that they had no orders, and I was obliged to draw them up for their guidance.

5434. (*Mr. J. R. Martin.*) Are you aware that the hospitals are supplied in India by the commissariat department?—Yes.

5435. Do you approve of that system?—Yes, very much.

5436. (*President.*) Are they better supplied than ours?—No.

5437. (*Mr. J. R. Martin.*) It has been stated that in the campaigns in India, the commissariat take better care of the men in front, and allow the hospitals to come in second best, did you ever hear of any such deficiency?—I have never been on service in India, but from what I have seen I should not apprehend that.

5438. (*President.*) Is there not a tendency to that in every service?—Yes; there are difficulties in every service which you cannot avoid.

5439. (*Mr. J. R. Martin.*) If you had an officer for the service of the hospitals, in the commissariat department, you would not apprehend any difficulty?—No.

5440. (*Dr. A. Smith.*) If you had a commissary for that service, would it not be desirable that he should not be removable to another service?—Yes.

5441. And he must take the position then that the purveyor does now?—Yes; it would be another name, that is all.

5442. (*President.*) You have not had much experience at home of general hospitals?—No.

5443. You do not know the system that prevails as to the manner in which they are supplied by the purveyor, or the manner in which repairs are done?—The same system holds throughout the whole service. I have served regimentally at home; I have been at Chatham for three months.

5444. Great complaints have been made as to the difficulty which medical officers find in getting repairs effected?—Yes; that holds throughout the service. If a pane of glass is broken you can hardly get it mended.

5445. Do you consider it is possible for the principal medical officer of the army in the field, considering the voluminous nature of his correspondence, having the management of a very large department, to look after the sanitary condition of the troops?—Yes, perfectly; whatever there is it will always come to him.

5446. When the bad results have shown themselves?—It is his duty to see to it at first.

5447. Is it possible for any man to do it, considering the weight of his other duties. I assume that the medical officer ought to see that every camp is kept clean and properly drained, and properly placed, that the abattoirs are properly placed, and that the offal is properly removed, which, certainly, would take up the time of one man fully?—These are things that are so much the A, B, C, of camp life, that the principal medical officer of a division attends to them. General orders are given and they are all provided for; that is the A, B, C, of camp life.

5448. But it is still a kind of A, B, C, which is very often neglected?—No; I do not know that; I

should not think so. For instance, talking about those general orders, they were issued very early in the Turkish campaign.

5449. Were they carried out?—Yes, afterwards. In January, upon going through the camps, I had to write officially on those very points both to the adjutant-general and to the quartermaster-general.

5450. When you wrote officially were the things you recommended attended to?—Yes.

5451. Always?—They were; orders were given.

5452. (*Mr. A. S. Stafford.*) Did you not find that the recommendations of the sanitary commissioners had a material effect in diminishing the amount of sickness and mortality in the army in the Crimea?—I do not think it affected them in any one particular instance; the result would have been the same if they had never gone there.

5453. (*President.*) Take the case of Scutari. If the dead dogs and animals had been left there, or if the wind that blew up the main sewer had been allowed to blow up the smells into the building, would it have been so, and was it not better to take precautions to put an end to those things?—Certainly; but the sanitary commissioners claim credit for reducing the sickness at Scutari in June 1855, but they forget that Scutari was supplied from the Crimea, and that the supply of sick had fallen off one half. I think in the March quarter, when we sent down about 6,000 sick, out of those perhaps 250 died on the passage, marking the gravity of the disease; and in the following quarter, when they take credit for the army improving under their auspices, we sent down about 3,000 sick, and out of those I think 19 died on the passage, but they had nothing to do with that; it was the character of the disease that had changed.

5454. Still, when one part of the buildings at Scutari had been drained, and the other not, cholera broke out in the undrained part, and not in the drained part?—Part of the building at Scutari is better constructed than the other. When the 49th was there they took fever. It was made a divisional hospital; but it was badly constructed. I do not say that you should not give proper attention to all sanitary matters.

5455. What you mean, I presume, is, that the nuisances had been detected, and the recommendations which were made by the sanitary commissioners had already been made by your own officers?—Yes.

5456. But at the same time, although there had been a detection of the nuisances, the Commissioners were quite right in repeating a representation of them when they found that former representations had not been attended to, and their function being especially to remove all nuisances, their recommendation received greater attention?—I do not know.

5457. Labour was placed at their disposal, was it not, and anything recommended was done?—At Scutari after a time it was.

5458. But in the Crimea?—Yes; after a time.

5459. (*Mr. J. R. Martin.*) You stated that all your recommendations in Bulgaria as to the encamping ground were not attended to?—Not until the cholera and pestilence struck the light division.

5460. (*President.*) Then you say that what you recommended in the Crimea was attended to?—As to the camp nuisances, in January and February I think almost everything that the sanitary commissioners put in their report had been recommended before by the medical men, and most of the things had been carried into effect, more or less.

5461. The first part of the answer is immaterial to the question; because a person who comes and sees a certain amount of nuisances does not abstain from commenting upon them, because somebody has commented upon them before?—No.

5462. (*Dr. A. Smith.*) Would it not have been fair to have said they had been commented on before?—Certainly.

Sir John Hall,
K.C.B.

19 June 1857.

Sir John Hall,
K.C.B.

19 June 1857.

5463. (*Mr. A. S. Stafford.*) How did they know that?—They were told so, and they admitted it themselves.

5464. (*Mr. J. R. Martin.*) It is not alleged that the former recommendations were carried out invariably, only less or more?—Which of theirs were carried out effectually?

5465. (*President.*) Do you consider that it would be impossible to have an officer especially attached to the camp for sanitary purposes?—I think it would not work well unless he was an officer appointed by the principal medical officer. Every principal officer of a division ought to do that; and if there is any body, it ought to be one of his own staff.

5466. In civil life in a small town you cannot get these things done, unless you appoint some special medical officer to do it; yet there the facilities are greater than in camp life?—Do you mean a medical officer of health?

5467. (*Mr. J. R. Martin.*) To be the medical topographer of the army?—Yes, it would be like having two kings of Brentford.

5468. (*President.*) But you would have only one king, he would be under the principal medical officer?—That is the only way that it could be done, or he would never know where sickness was prevalent.

5469. But it would be desirable for him to know where the sickness was likely to occur, prevention being better than cure?—Yes, but what are the principal medical officers of divisions for?

5470. (*Mr. J. R. Martin.*) Is it not found in every service that there must be a division of labour, and is not that one of the causes of the nomination in civil life of medical officers of health in our great cities?—That may be, but every man who is a physician is a sanitary officer—his education makes him so.

5471. (*President.*) Do you find that to be the case with civil physicians?—Yes, I think so; their education makes them so, and in the army you are forced to be so more than in civil life.

5472. (*Mr. J. R. Martin.*) Are they taught previously to entering the army anything of military hygiene?—Not before, but they cannot avoid it afterwards; your education gives you general principles, and if you come to specialties, they get them in the popular works of the day.

5473. Is that sufficient for the sanitary service of camps?—I say that one's own education explains it, and no man would be at the head of an army who had not had some experience.

5474. Does it not happen that the old surgeon, as he grows old, when he looks back, feels that he has acquired that knowledge at the expense of the soldier in too many instances?—It may be, but we are not without instruction; some of the best works which have been printed were written by army medical men. There is no work better than one by Dr. Jackson.

5475. It relates, does it not, to the formation, discipline, and economy of armies, and there is only some part of the appendix which relates to sanitary matters?—Yes, but there are the works of Brocklesby, Maclean, Millingen, &c., and those are standard works.

5476. But they are not united and brought together as the French works are?—We have the whole of it, and what every man grounds his special information on in the able reports of the Health of Towns Commissioners.

5477. Do you think that those are known to the medical officers of the army?—They have very easy means of getting at them.

5478. (*President.*) Sanitary science is almost a modern thing, is it not?—The technicalities are.

5479. In England a few years ago nobody ever dreamt about the evils arising from cesspools?—Yes.

5480. (*Dr. A. Smith.*) The medical officers in the army long before that time knew perfectly well the evil consequences of cesspools, and they were constantly representing them?—Yes, constantly.

5481. How long have you been in the service?—42 years; I have served almost everywhere except in North America.

5482. Have you observed during that period that medical officers of the army have been employed only in the treatment of disease, or have you seen them also to be engaged in devising and recommending measures with a view to the prevention of disease?—In both, with regard to the prevention as well as the treatment of disease.

5483. What occurs from time to time in military service which renders it necessary for medical officers to recommend sanitary measures?—If you are in quarters, crowded or badly ventilated rooms, bad position of the barracks, and if on service, the position of camps, duty, food, and clothing, or anything that tends to injure the health of the men.

5484. Is it generally understood that medical officers are required to use every possible effort to prevent disease as well as remove it when it has arisen?—Yes.

5485. Are not medical officers of the army generally required to report annually all circumstances which they have considered calculated to injure health, and to state what steps they took in reference to them?—It is laid down under distinct heads what they are to report on, and they are instructed not only to state what representations they have made, but what answers have been given in reply.

5486. Are not senior medical officers of foreign stations and districts at home required to report periodically all defects they may discover in barracks, hospitals, or their precincts, which in their opinion may operate to the injury of the health of the troops?—Certainly.

5487. Are the defects reported usually remedied or only a portion of them?—Sometimes they are remedied and sometimes not.

5488. What have you understood generally to be the reasons why the whole were not remedied; were they the want of sufficient pecuniary means or a belief that they were not of such a nature as to require the adoption of the remedies recommended?—Sometimes they say that they are not in the estimates, and sometimes that they do not think they are required.

5489. Do you think that surgeons and staff medical officers superior to them are possessed of the knowledge necessary to enable them to detect defects calculated to operate disadvantageously on the health of troops, however circumstanced; and that they have the knowledge requisite to enable them to prescribe the measures which should be adopted?—Yes, I do.

5490. Such being your opinion, do you think it would be to the benefit of the service to introduce officers for sanitary duties, simply officers who should, wherever they might be serving, be quite independent of the principal medical officer of the army or command?—I do not believe that it would.

5491. Would the establishment of such officer or officers not be followed by an amount of confusion, uncertainty, and jealousy which would operate to the injury of the service?—It would most decidedly.

5492. Could a sanitary officer, unless he was placed exactly as a second principal medical officer, and in possession of equal powers, be able to secure all the information necessary to enable him to know exactly what was required?—No; I think not.

5493. Would the giving him a power nearly equal in all respects to the recognized principal medical officer, and more in certain respects, not place the military officer in command in a highly unfavourable position by depriving him of the power of fixing responsibility, so far as the health of the troops is concerned, on one individual?—Yes, it would, but he would most likely refer to the principal medical officer.

5494. Suppose this officer was appointed for that duty, and the Commander-in-Chief was to be guided by his reports, he would then take away from the principal medical officer the responsibility of reporting upon the causes of sickness?—Then you would

place the commander of the army in this position—he would either have confidence in his principal medical officer or not. If he had, he would refer the sanitary reports to him.

5495. (*Mr. J. R. Martin.*) Do you recollect an address of Lord Grey's in the House of Lords, in April 1854, on the military administration of the army?—No.

5496. It was there stated, that during the last half century, when the medical officers of the army, from all our foreign possessions, were making the reports referred to by Dr. Smith, that in none of our possessions was anything done, and that in several of the West India colonies, the soldiers were placed in barracks in which, had convicts been placed, the superintendent of the convicts would have protested against the men being placed there, and yet British soldiers were placed in those barracks?—I do not recollect any discussion upon the subject; but, with regard to the West Indies, I can state, that I wrote, I suppose, a quire of paper about the accommodation of the 92nd regiment in the barracks at St. Vincent, which contained, I think, a cubic space of about 250 feet for each man, and I recollect making use of that very expression, and saying that the felon was allowed his thousand cubic feet, and the soldier only 250.

5497. So that it is established that, notwithstanding those continuous and frequent reports, nothing was done?—I do not say that, because something was done on that occasion. Lord Grey, I recollect, in 1837 issued the most comprehensive series of queries that ever was issued as to everything connected with the organization of the army.

5498. That was the first movement that had been made by the government, was it not?—Yes, in 1837, and I should think that the result of that inquiry must have been of great value, for you have there the opinion not only of every medical officer in the service at that time, but of every commanding officer, both as to the clothing, quarters, diet, and everything connected with the economy of an army.

5499. You are aware that in the island of Jamaica, where the mortality for ages averaged 130 per 1,000 per annum, it had for a length of time been recommended by Dr. Robert Jackson that the European troops should be removed from the pestilential plains to the mountains, yet that had not been done until under the government of Sir Charles Metcalfe?—Yes.

5500. Does not that show that a system of reporting may exist for ages without anything being done?—Yes; but you must bear in mind that other reasons as well as the health of troops had to be considered in the selection of sites for barracks in the West Indies, particularly in Jamaica; the barracks there were built for a defence against an external enemy, and you could not put your troops in the mountains, but the defects of the sites were perfectly well known, and frequently reported on to my certain knowledge, as I served 13 years in Jamaica.

5501. Is it not stated by Dr. Robert Jackson, that the position of European troops in the West Indies has never had any reference to military considerations, on the contrary they were placed upon the sites of old towns which had been fixed upon either by the original settlers or by the naval commanders?—That observation does not apply to Up Park camp in Jamaica.

5502. (*Sir H. K. Storks.*) But Up Park camp was very unhealthy, was it not?—Yes, but it was one of the most beautiful sites imaginable; it was like a gentleman's park.

5503. (*Dr. A. Smith.*) Admitting that no notice was taken of those reports, the fault should not attach to the medical department?—No.

5504. And further, there is no evidence in existence to show, that if there was any sanitary officer for that purpose, his reports would be attended to?—No.

5505. Do you see any reason to infer that a sanitary commissioner's report, as he could not be an

officer of very superior standing, would be any more attended to?—No; certainly not.

5506. (*Mr. J. R. Martin.*) Are you not aware that in the city of London it is distinctly the reverse of that, and that the officer of health for the city of London is attended to by the municipal authorities of this great city?—That may be.

5507. You stated just now, as to a sanitary officer, that you would naturally appoint an officer specially to execute those duties?—Yes.

5508. You do not see, if an officer was appointed by you, or appointed by the director-general, to undertake those duties, that there would be any inconvenience in it then?—I think it would be better left to the principal medical officer of the army.

5509. To select a man on the spot?—Yes, he would naturally select the man he thought best fitted for the appointment.

5510. (*Sir James Clark.*) Do you not think that the director-general at home would know the medical officers who were the best fitted to be appointed?—Yes, he might.

5511. (*Mr. J. R. Martin.*) Sanitary science being new in civil communities, it has been observed that the objectors are composed of two categories, one the older practitioners, who for a long time have ceased to improve their knowledge, and the other young men who have not acquired any real knowledge, does that accord with your experience in military life?—No, because every man must be to a certain extent a sanitary officer.

5512. That is after a long service; a young assistant-surgeon cannot be designated a sanitary officer?—No responsibility attaches to him, but the great question of a sanitary position of a camp or a barrack would not be left to young officers.

5513. Would it not be better that a young man entering the army should be instructed on those most important matters as to the prevention of disease?—Yes.

5514. You are aware that Dr. Allison of Edinburgh has stated, referring to this subject, that next to the important discoveries which during the last half century have been made in physiology, the most important are the discoveries that have been made as to the influences of external causes of disease?—Yes? I do not undervalue that, and I do not say that we do not want information in the army.

5515. (*President.*) Do you think that the present ration given to the troops is sufficient for a man, three quarters of a pound of meat, and a pound of bread?—He makes it up by what is called messing.

5516. He does not make up the meat, he gets vegetables, coffee, and tea. Is the meat enough?—Perhaps it would be better to give them a pound. If you take diet into consideration, take the hardest races; they do not eat the greatest quantity of animal food. If you take an Irishman, or a Scotchman, or a Swiss, they do not eat large quantities of animal food.

5517. But an Englishman generally does?—Yes; if you were fixing a standard, a pound would be better; you see recruits come in who get fat on three quarters.

5518. Three quarters of a pound of meat with bone when cooked produces something not over eight ounces?—No, if you are fixing on a scale, I would fix a pound.

5519. Would it be a good thing if, instead of the commissariat supplying the bread and meat alone upon the $3\frac{1}{2}d.$ stoppage, the men messing themselves up to $2\frac{1}{2}d.$ or $3d.$, there was one uniform stoppage, and one ration which comprised all the various articles of food, do you think that would answer?—Not well; it would simplify things, but it would not answer.

5520. Why?—You would not get the supplies.

5521. Have you any reasons to state why it would not work well?—I think the things would not be so good sometimes.

5522. Do you not think that the commissariat would purchase better things?—There is a great

*Sir John Hall,
K.C.B.*

19 June 1857.

Sir John Hall,
K.C.B.

19 June 1857.

feeling; I think it would be desirable to have the ration if you can have it complete.

5523. So as to secure that the men shall always have a sufficient balance of food to keep them in perfect health and efficiency?—Yes.

5524. And a net balance of pay always the same?—Yes; that is the great difficulty when you take the field, because the messing could not be carried out; there are no markets. I recommended salt and pepper, and those things, to be issued, but they said there was not occasion for them, and the consequence was that the men did not get them.

5525. Would it not be an advantage not to have to change the feeding of the troops when a war breaks out?—Yes.

5526. Unless it was unpopular among the men, you do not see any objection?—No; I think it would be desirable, and that was the great point that I was striving for, to get the commissariat to supply those things.

5527. Would there not be this advantage, that in the different climates you could by regulation procure the food that was best suited for the men?—Yes; you would take the diet of the place which was adapted for the climate.

5528. (*Mr. J. R. Martin.*) Under medical regulations with the sanction of the generals in command?—It would be fixed by a board of officers.

5529. You would allow a supper for the soldier?—Decidedly.

5530. A fourth meal?—No, a third meal of tea.

5531. Would you not approve of its being composed partly of meat. If the meat ration were increased, and some part of the meat should remain over, it would make a comfortable supper for the soldier?—They would put aside something for their supper.

5532. You would approve of that?—Yes.

5533. (*President.*) You have served in India for two or three years?—Yes.

5534. You never served in the field?—No.

5535. Have you seen the encampments of sepoy regiments?—Yes, their lines.

5536. They are in huts?—Yes; they are always hutted, and they get a sum of money if they change—hutting money.

5537. Are you aware of the fact that the mortality among the sepoy regiments is much less than among the Queen's troops all over the world?—I can fancy that, because they are in their native country.

5538. So are Englishmen here?—I think it is a great advantage to have small barracks and small hospitals.

5539. Do you not suppose that one great cause of their better health is, their not being congregated in large barracks?—Yes, they live quite differently from Europeans, they live with their wives and children, and they never drink. So far as the barracks are concerned, the regulations in India are on the most magnificent scale. Every soldier in barrack has 1,200 cubic feet, and every man in hospital 1,800, you could not do that in this country; the married men live there in what are called patcheries. When I was last at Hyderabad, in Scinde, I lived in a private soldier's rooms; they had just been finished; each married soldier has two rooms, a kitchen, a wash-house, and a privy. There is no subaltern officer in Great Britain so well provided with barracks as the married soldier is at Hyderabad, in Scinde.

5540. The mortality among the officers of the East India Company, who are permanently in India, I believe is not larger than that of the officers in the English army?—Between the West Indies and other stations a larger proportion of our officers who are abroad serve in unhealthy climates. In India officers have more comforts and better means of preserving their health than elsewhere.

5541. But the health of the Company's officers is better than the health of the Queen's officers in India?—That I do not know.

The witness withdrew.

Monday, 22nd June 1857.

PRESENT:

The Right Hon. SIDNEY HERBERT, M.P.
A. S. STAFFORD, Esq., M.P.
Col. Sir H. K. STORKS, K.C.B.
Dr. ANDREW SMITH.

T. ALEXANDER, Esq., C.B.
Sir JAMES CLARK, Bart.
J. R. MARTIN, Esq., F.R.S.

PRESIDENT, The Right Honourable SIDNEY HERBERT, M.P.

Sir JOHN HALL, K.C.B., further examined.

Sir John Hall,
K.C.B.

22 June 1857.

5542. (*President.*) Have you the copies with which you promised to furnish the Commission of the recommendations which you made?—Yes, I have.

5543. Do they apply both to clothing and the cleansing of the camps and various other subjects?—I have drawn out a kind of abstract of my recommendations, as to everything connected with diet and their dates, and one with regard to sanitary matters.

5544. Do you propose to read them or to put them in?—I will put them in.

[The same were delivered in.]

5545. Have you any of the recommendations which you made with regard to the hospital at Scutari?—There are some which I have already handed in.

5546. Do they include all?—These are merely some letters to Dr. Menzies about whitewashing.

5547. Have you any copies of requisitions for medical comforts in Bulgaria?—Yes, I have, and can furnish them.

5548. (*Mr. J. R. Martin.*) With their dates?—I think so. I can give the requisitions and all my demands in the Crimea up to March; after that there was scarcely any limit, the supplies were ample.

5549. (*President.*) Did you not make some changes in the forms for the weekly divisional states in the Crimea?—Yes, in Bulgaria I drew up a form.

5550. Can you furnish the Commissioners with the form as it was, and the form as you altered it?—I do not know what there was. I drew up a form then.

5551. For the weekly hospital medical states?—Yes.

5552. With regard to the statement that you made, I think you say that you received an intimation from Lord Raglan of the departure of the expedition to the Crimea the day before it sailed?—No. I had no official communication of it; it was merely a common rumour. It was with regard to the expedition to Kinburn that I received intimation the day before, and that was afterwards. That was about October 1855, I should think.

5553. I understood you to say that you had no official notice of the expedition to the Crimea?—Not of the embarkation, that was made entirely without reference to me.

5554. You only heard of that the day before?—No. I heard the general rumour.

5555. (*Mr. A. S. Stafford.*) What official intimation did you receive?—None. I had an official notification on the evening of the 26th of August, that the "John Masterman" was to take the medical stores of 400 tons, and the expedition was expected to sail on the 1st of September.

5556. (*President.*) Did it say on the 4th?—No, the expedition sailed on the 4th.

5557. Lord Raglan's general order announcing the sailing to the Crimea was dated August the 31st, was it not?—Yes, at the end of the month.

5558. Marshal St. Arnaud's preceding it was on the 25th?—Yes, I believe so. Some of the artillery embarked and went to Baltschek Bay before that; but I think that the divisions marched in and embarked about the 1st of September.

5559. If I understand you, your complaint is not that you did not know, but that it had not been specially communicated to you?—No intimation was given to me, otherwise than that complaints were made that on board some ships they had no medical officers; on board other ships they had two or three; and that in some they had medicine, and in others none. I had no means of obviating it, because I did not know.

5560. In the evidence you gave January the 16th 1855, before Mr. Maxwell and Dr. Cumming, you mentioned there, "I never was consulted about the quantities of medicine and comforts to be taken with the army to the Crimea. The quartermaster-general never communicated to me that he was going there. Lord de Ros was sick. Major Wellesly was acting-quartermaster-general." Did he communicate to you?—No; the only communication that Major Wellesly gave me was about the "John Masterman." I never received a notification from the quartermaster-general's department, that on such a day such a part of the army would embark, and requiring me to make medical preparations.

5561. When you say, "I never was consulted about the quantity of medicine and comforts to be taken," would not that be a matter for you to decide?—That is their wording, not mine. What I meant there was, of course, that I was to judge what was necessary, but I had had no intimation of the army embarking.

5562. You say, "I did not even know what number of men were to embark. Lord Raglan consulted me as to what I proposed to do for the conveyance of the wounded, and asked me to put my views on paper, as to what conveyance would be necessary for an army taking the field. I wrote this letter," that is the letter of the 3rd of August. The two sentences appear to contradict one another?—No. He said, in the event of the army taking the field, what would be the preparation.

5563. It was hypothetically put?—Yes; I did not get the official information which is usually given in other places, from the quartermaster-general's or some other department. I understand, when the Commander-in-Chief decides on a movement, it should be the duty of some one to communicate it to the civil departments which have to make arrangements.

5564. When the staff officer turned out those nine waggons and mules, and left you with three ambulances with no means of moving them, did you make any remonstrance on that subject?—I had no means. I had sailed, and I did not know it till I landed in the Crimea and found two waggons on the beach.

5565. Did you represent that this had been done?—Yes, it was perfectly well known.

5566. Did you represent it to Lord Raglan?—I do not know that I did; I did to the quartermaster-general's department; there was no means of helping us there.

5567. (*Mr. A. Stafford.*) It has been stated in evidence before the Commission that half a pound of additional meat was included in the daily ration, and good soup with rice daily, with pepper and salt, was given at the recommendation of Dr. Alexander to the whole army on the 27th July 1854; had you any knowledge of this?—No, I had not. So far as the meat is concerned, I thought that it was my own recommendation.

5568. (*Mr. T. Alexander.*) Perhaps I may put in this letter from me to General Airey: "Camp, Monastir, 27th July 1854. Sir, As everything tending to the preservation of the health of the troops at present is of consequence during the prevailing epidemic, I have the honour to suggest that half a pound of additional meat should be included in the daily ration, so that good soup, with rice daily, pepper, and salt, may be had by the men the meat in this country being of very inferior quality compared with that at the Cape, where the ration was one and a half pound. I beg also to recommend that during the discontinuance of the sale of country wine good rum should either be issued in a certain quantity as a ration, or if not, the same may be allowed from the canteens at certain hours, and under certain restrictions as to time and quality, whenever deemed advisable. I have the honour to be, &c (signed) T. Alexander, staff-surgeon of the first class, light division. To General Airey, commanding light division camp, Monastir."

(*Witness.*) With regard to the half pound of meat, I never heard of Dr. Alexander's letter before now. In a conversation with Lord Raglan, his lordship stated a representation had been made to him that the meat was poor, and he asked me if I thought an increase would be advisable, and I said "yes," and he issued it temporarily. With regard to the rice, salt, and pepper, after my inspection of the different camps on the 15th July, I wrote to Lord Raglan recommending rice to be issued; and on the 19th a general order was issued sanctioning two ounces of rice or two ounces of barley to be issued daily to the troops. With regard to the salt and pepper, it was not issued: it was, I believe, ridiculed by some of the commanding generals, and it was not issued till, I think, the March following. I wrote two other letters on the same subject; one to Lord Raglan, and one to General Estcourt.

5568a. (*Sir H. K. Storks.*) There is a general order of the 30th July:—"It having been recommended by a board of medical officers that during the present season a small supply of spirits should be issued to each man, the commander of the forces is pleased to approve of the same, and to direct that the commissariat department will issue spirits in the proportion of one gill;" that was reduced afterwards to half a gill?—Yes; that was a committee of which I was president, and I recommended it contrary to my own opinion. When the cholera broke out, there was a great outcry for rum to cure it; and as I had never seen rum do any good, I signed it more out of deference to the opinions of others than from any conviction of my own. The healthiest army I ever served with had not a drop of brandy, or wine, or malt liquor, for months at the Cape.

5569. (*Mr. J. R. Martin.*) That is a peculiarly fine climate, is it not?—Yes.

5570. One of the best known climates?—Yes.

5571. Referring to what you have said, with regard to the information given to you as the head of the department, is not a general order usually issued before an army breaks ground, and is not that considered a sufficient announcement to all the heads of the departments?—No, not if you have arrangements to make; a general order is not issued until the day before the army marches. You are supposed to get the information as soon as the movement is decided upon. It is usual in India and at the Cape of Good Hope.

5572. At Rangoon Sir Archibald Campbell issued a general order weeks before, and all the heads of the

*Sir John Hall,
K.C.B.*

22 June 1857.

*Sir John Hall,
K.C.B.*

22 June 1857.

departments prepared accordingly?—Yes; such an intimation would be sufficient.

5573. Was not the order of Lord Raglan issued several days antecedently?—I think it was not issued before the 31st of August. So much so that Dr. Dumbreck got into great trouble for having said that the army was going to Sebastopol; and I was called upon to ask him by what authority he stated that the army was going to the Crimea, and he was obliged to explain that it was the common camp rumour. That was when the Guards had marched down, and had come in for embarkation.

5574. As to preparation, it did not signify where the army was destined; the question was simply a matter of embarkation on any given date?—Just so.

5575. (*President.*) Do you recollect when the camp at Devno was formed?—I do not recollect the exact date. The light division moved up, I think, some time at the beginning of July.

5576. General Brown commanded them, did he not?—Yes.

5577. Had he no medical assistance in selecting the camp?—I do not know. I was not there at the time.

5578. (*Sir James Clark.*) You knew that they were going to Bulgaria, did you not?—I had only just arrived from India, and I think that the light division had gone to Bulgaria before my arrival at Constantinople.

5579. (*President.*) You do not know who chose the sites?—No; I am quite ignorant of that matter.

5580. (*Sir James Clark.*) Did you find fault with the sites?—Yes, with all but that of the second division. Nothing could be more objectionable than the one at Devno; it was placed just above an extensive swamp.

5581. Are you aware that Omer Pasha wrote to say that our army would be destroyed if they remained there?—No.

5582. When you found it so bad, did you recommend the removal of it?—Yes, I wrote a letter on the 15th July, recommending it; the third division was also recommended to be removed, but there is no record of it; it was done verbally, as a great deal is done in the field. I not only recommended the camp at Devno to be removed, but I recommended that of the first division to be moved also, and the third division to be put on the Galata heights.

5583. Do you think that, if the site of the camps had been better chosen, the health of the troops would have been better?—Yes, it might have been.

5584. (*President.*) Do you think, from your experience in many parts of the world, that the consumption of salt meat in our colonies is larger than is good for the health of the men?—I think that you may give salt meat twice or three times a week with impunity, if you have fresh vegetables.

5585. Have you paid much attention to the subject of education for candidates for the army medical service?—Not as to their preliminary education. I was quartered in London for about $3\frac{1}{2}$ years, and at that time I was a member of the board of examiners here.

5586. Do you think that the present system of diplomas that you exact from a candidate before he is submitted to an examination is sufficient?—No man is admitted into the army unless he is duly qualified to practise medicine; it would be a reflection on the colleges to say they are not sufficient. Nobody is admitted until he has passed those examinations, which would entitle him to practise in civil life.

5587. Supposing that the diploma of the College of Surgeons of London is a diploma of pure surgery alone, whereas a similar diploma from Edinburgh and Dublin comprises an acquaintance with *materia medica* and so on besides, should you say that those two diplomas are equally good?—With regard to the London College of Surgeons, I should think that most of the young men have passed the Company of Apothecaries, who are a licensing body for medicine.

5588. That is, that they ought to do so?—Yes; they are not admitted into the service without producing a preliminary qualification that would entitle them to go up for examination,—so many courses of chemistry, so many courses of medicine, and so on.

5589. Do not you think that, if one diploma covers more ground than the other, in the case of a candidate bringing a diploma covering the least ground, something ought to be exacted from him more than from the others?—I fancy that the examination at the board was intended to cover that.

5590. But the examination at the board is theoretical, is it not?—No; it is practical at the medical board.

5591. Do you see them operate?—No; you have no means for doing that.

5592. Nor are they examined clinically?—No; but when I speak of practice, I mean that they examine on practical subjects.

5593. Would it not be an advantage to examine them all practically as well as theoretically?—You must have a hospital to do that, you would have a better test of the men by seeing them operate; many men have a good deal of book knowledge and very little practical knowledge.

5594. (*Dr. A. Smith.*) Were you not then aware that it was the habit to send men who passed their examination before the medical board in London to Chatham, and retain them sometimes for six or seven months, during which time they were tested as to their knowledge in all branches of their profession, and also of operative surgery and practical anatomy?—Yes.

5595. (*Mr. J. R. Martin.*) Were any of those who were sent to Chatham for six or seven months' probation, practically ever rejected afterwards?—That I do not know; I never served at Chatham.

5596. (*President.*) You were an examiner for some time?—Yes; about three years and a half.

5597. What was the proportion of rejections among the candidates coming up?—I could hardly say; the rejections were certainly very small; occasionally men were rejected.

5598. Did they come up for examination again?—In the case of one young gentleman who had been rejected, his father had been in the service and he was very much distressed about it. It was one of those cases in which we had introduced written examinations, and when his father saw the questions that had been put, and his son's answers, he was obliged to admit that he had had a very fair examination and that he was very properly rejected. He was very much distressed about it, and he was sent back to study. He applied himself diligently and passed afterwards.

5599. So that none were finally rejected?—I do not recollect that. I recollect the case alluded to better.

5600. (*Dr. A. Smith.*) From your position, had you an opportunity of ascertaining whether or not they were rejected?—No, not beyond the examination here; what I allude to is the examination at the board here.

5601. (*President.*) Would it not be an advantage to have a practical examination before men go to Chatham, because a man that cannot pass a practical examination is hardly fit to go down to Chatham?—You could have a practical examination there if you liked. You do not admit people till they have passed an examination which would entitle them to go and practise medicine in any part of the United Kingdom.

5602. You profess in entering the Queen's service to give them immediate advantages, in return for which you have a right to see that they are perfectly competent?—Yes; but you must alter the whole system of examination as instituted for that purpose. I do not think that it would be well to abolish that. Anybody who has examined young men will know that after they have passed their examination, if you

examine them, as I have done, six or eight or twelve months after they have passed their collegiate examination, you find that they have not studied or paid any attention, and as knowledge is fleeting, you will speedily observe that they have gone back.

5603. Still examination is an advantage, as showing that they were capable in getting up the subjects ?—Yes.

5604. That is, putting it as a mere cramming examination ?—Yes.

5605. But a practical examination very much militates against the system of cramming ?—Yes, in surgery and medicine ; particularly in surgery.

5606. Do you approve of the system of competitive examination ?—I think it is a very good thing.

5607. You would prefer it to a mere absolute standard ?—Yes, it is answering very well in the East India Company's service.

5608. Do you think that their system is also a good one of having a permanent body of practised examiners ?—I do not see any great advantage in that. A practised examiner is very well if you are examining a man to test his school education, before he is admitted into the profession at all : but before he is admitted into the service it is not absolutely necessary, and I think it would be rather a disadvantage. It is very important for the director-general to have a certain knowledge of all candidates, and he acquires it by superintending every examination better than in any other way.

5609. Would you require any knowledge of military hygiene from them before they pass their examination at the medical department, or would you prefer letting him acquire it subsequently ?—I think that forms a part of a medical man's general education, but you may examine him on that, of course, and he may turn his attention to it. I think that if you instituted a military chair, that would be a very important branch of it.

5610. You have two military chairs, have you not ; one in Edinburgh and the other in Dublin ?—Yes ; military surgery is general surgery ; but it is of very great importance to have your men taught what they are likely to meet with when they enter the service, and that can be only taught by people who have seen it.

5611. As at present a student can get this advantage in Edinburgh or in Dublin, but not in London, is not that an inequality which is disadvantageous ?—I think it can all be acquired by reading approved works.

5612. Would it not be better, and is it not in practice done, that the examination of the medical department should include military hygiene ?—It is very easily introduced.

5613. Would it not be better to keep it out and to make it the subject of a subsequent examination at Netley or at Chatham ?—I think it would be a very appropriate place to qualify men on that subject.

5614. If you moved your chairs from Edinburgh and Dublin into a general hospital, then you would ensure that all the men would go through these courses ?—Yes ; that is very important, more important than having a chair either in Edinburgh or in Dublin. I would compel each young candidate who enters the service to remain there till he became thoroughly acquainted with the routine of the service, and with everything connected with the health of the army.

5615. (*Mr. J. R. Martin.*) To go through a year's probation ?—Any fixed time ; you might have to modify it for special instruction, but I think that it is very important. Nobody can speak more strongly on that point than myself, having had a number of young men sent out who were very unfit for their duties ; there was nothing to object to in their professional education, but there was a total ignorance of everything connected with the army. It was no fault of theirs ; but if they had been at Netley they would have acquired that knowledge. Some of them came direct from the schools, but the service required

it. If young men could be sent down to Netley, or any other establishment where there was a large hospital, to have the benefit of instruction from a person conversant with army arrangements, it would be a great advantage to the service.

5616. (*President.*) Would you have any examination on those subjects before they left the general hospital ?—Yes ; I think, whatever examination there might be, the director-general would be wise in having an examination before they left.

5617. So as to make sure that they had not wasted the opportunities given to them ?—Yes ; that ought to be enjoined.

5618. What length of time would be sufficient for them to acquire this ?—Six or eight months.

5619. (*Mr. J. R. Martin.*) Would it not be an advantage, as a superadded knowledge to be imparted to the young military surgeon, that he should also receive a manual of military hygiene ; and that there should be a work for the benefit of the young surgeon ?—I think it would be very desirable ; but the leading points are comprised in other works that are published.

5620. But they are a good deal scattered about in French or English works, are they not ?—It would be an advantage, I think ; and there ought to be a manual to explain to the officers entering the service what they would have to do in every position in which they might be placed. I think that is very much required undoubtedly ; not only the forms of all the returns that they would be required to send in, but everything.

5621. (*Sir J. Clark.*) You mean, that every officer should have that information ?—It might be an advantage to them.

5622. (*President.*) Would you have any examination of an assistant-surgeon for a surgeoncy ?—That is a question, within my recollection, that was tried.

5623. That existed, did it not, when you came into the service ?—Yes. I was examined, and no good resulted from it. Perhaps it gave great dissatisfaction. I think there is no objection to it.

5624. Was it well conducted ?—Very stringently.

5625. It was conducted by two or three officers named on the spot where the candidate was ?—Yes.

5626. Did it not produce great inequalities in the examination ?—Yes ; but the director-general had the opportunity of judging,—the questions were written and the answers were written down, and forwarded to Sir James McGrigor, then at the head of the medical department.

5627. (*Sir H. K. Storks.*) Who proposed the questions ?—The Board of Examination formed their own questions, and wrote those questions down, and the answers were appended to them.

5628. (*President.*) There were no means of comparing the relative merits of one examination in the East Indies and another in the West Indies ?—The director-general had an opportunity of judging, as he saw them all.

5629. There was not sufficient similarity in the questions put to enable any one to say exactly ?—No, you could not say that it was a test of the same thing. The same question was not put to several. The questions varied on every station.

5630. Since that time the whole system of examination has been very much improved ?—Yes.

5631. And the feeling with regard to examination has very much altered ?—Yes, I think it would ensure this, that medical officers, knowing that they must undergo it, would then keep themselves conversant with the opinions of the day.

5632. When a young man first joins his regiment he is thrown into society different from what he is accustomed to, and there is a great temptation to idleness, and the fact of his having an examination to go through would, you think, keep him to his work ?—Yes, it might with some, but it would not have that effect with others ; if a man were inclined to be idle he would be idle, and he would trust to the chapter of accidents to read up at the time.

Sir John Hall
K.C.B.

22 June 1857.

Sir John Hall,
K.C.B.

22 June 1857.

5633. It might make a man more diligent?—Yes; as he would have an object in keeping up his information.

5634. (*Sir J. Clark.*) If a series of questions were issued every year by the director-general, for all stations abroad, would not that afford the means of comparing the whole of the assistant-surgeons examined the same year?—If you could have them issued simultaneously; but if you issued one set of questions they would get hold of them in particular places.

5635. (*President.*) There would be no very great difficulty in preventing that?—Perhaps not; but would you examine everybody?

5636. (*Sir J. Clark.*) Every one before promotion?—When those other examinations were carried out in former days, many of the assistant-surgeons had been 14 or 15 years in the service, and it was supposed that promotion would follow.

5637. (*President.*) Might they not take their examination at any period after two years?—I believe that is the system in the navy. Assistant-surgeons to be qualified must go in for an examination for the surgeoncy, there is no difficulty in it.

5638. (*Dr. A. Smith.*) How would you provide for this case:—A senior or nearly a senior assistant-surgeon is serving in New Zealand, and he ought by seniority to be promoted; would it not be necessary to bring him home to examine him?—According to this plan I presume it would.

5639. (*Mr. J. R. Martin.*) You stated, did you not, in your last examination, that in the event of a medical officer of health being appointed for field service, he should be subordinate to and dependent upon the principal medical officer?—I think he ought to be so. There would not be much harmony if he was independent of the principal medical officer, it could not exist.

5640. Has it not been rather in your experience that if one officer be subordinate and dependent upon another officer, clashings may occur; but if you render the two functions separate and distinct, no such injurious obstructions to the public duty take place?—You would leave the Commander-in-Chief with two authorities to refer to, and he would not decide very likely without consulting the principal medical officer. I can give an example. All the reports of the sanitary commissions sent out to the Crimea were sent to me. It could not possibly work well, and you would place the Commander-in-Chief, I think, in a position that there is no necessity for.

5641. (*President.*) At present the Commander-in-Chief consults neither?—I do not know that; there are things done certainly without consulting either.

5642. (*Sir H. K. Storks.*) He need not consult him?—He is not obliged to consult the principal medical officer. There is nothing to compel him to ask his opinion upon any subject.

5643. (*Mr. J. R. Martin.*) Are not the medical, surgical, and administrative duties of the principal medical officer in the field absorbing pursuits, and sufficient to occupy all his attention without being called upon to supervise the sanitary arrangements of an immense camp as well?—Yes, I think that I would not saddle him with much more duty, though he cannot do his other duties without attending to that; he is the only person who has information; there is no person else if a regiment is encamped in an unhealthy locality that knows it so soon; take, for instance, this as an example—we had sanitary commissions in the Crimea, yet I was obliged to remonstrate about two battalions of the Royals being placed in a very objectionable site.

5644. (*President.*) Still with an army in movement it would be quite impossible for the principal medical officer to be going round with the quartermaster-general to look at the sites and the ground to be taken up?—Individually at the time it would be so, but he has subordinates. There is a deputy inspector with every division. There are first-class staff-surgeons with every division, and one of those officers could go round with the quartermaster-general.

5645. But are they all equally fit to discharge the duty?—I am supposing that every man is to be instructed.

5646. (*Mr. J. R. Martin.*) That is not the case in civil life; a separate functionary is set aside as an officer of health?—Yes, but you are touching on private property.

5647. No, public health?—I do not think that is in point exactly; the army is so organized that there must be subordination. You must place a person quite independent of that, and I do not think that that would be desirable.

5648. It has been stated in evidence here by one, if not by two general officers, that they would consider it an advantage that the sanitary officer should be separate and distinct?—They have not generally acted up to that; besides, it is supposing that the military medical officer is not competent to give this advice, which I do not admit.

5649. No, but that another selected functionary shall be more competent?—If you give a military functionary authority, he does not want for intelligence if his recommendations are attended to. I think they would be sufficient.

5650. Does your experience in the army tell you, that every officer as he rises to administrative duties is fit for so high a position?—I do not look upon it as so high a one, but there are always men in the army that are competent, to whom they can refer.

5651. (*President.*) At any rate there would be, if it were drawn out, and proper weight was given to it?—Yes.

5652. (*Dr. A. Smith.*) You would have a properly selected officer from the staff to do it?—Yes, the intercourse of the principal medical officer with them would enable him to judge of their capacity, and he would select a proper man.

5653. (*Sir H. K. Storks.*) Is it desirable to have such a person?—Not to set apart a man. Supposing an army is separated, the one division may go 20 miles and the other may go 10 miles off. Sebastopol was an exceptional case, but if an army was moving you could not do it; where would the sanitary officer be? He could not be with all the divisions.

5654. (*Mr. J. R. Martin.*) Are you aware that the French had a council of sanitary officers?—Yes, they had; I think it is a board. M. Baudens came out and I met him in the Crimea.

5655. I understand that your principal objection is, that the two authorities would clash together?—Yes, I think it would be found so.

5656. Is it found to be so with the other heads of departments, the adjutant-general and the quartermaster-general?—No; but they have distinct duties, if you put anybody in to interfere with their duties they would clash.

5657. (*President.*) Has not the adjutant-general some one serving under him?—No, excepting his subordinate officers, who cannot clash with him.

5658. (*Mr. J. R. Martin.*) But the prevention of diseases and their cure are separate functions, are they not?—Yes. You are bound to guard against disease; and you have to take every precaution that either science or experience points out.

5659. (*President.*) Is not the difference between an army medical officer and a civil officer this,—that the army officer has both duties to perform, while the civil officer has only one?—Yes.

5660. Therefore it is one of the chief duties of the army medical officer?—Yes; his object is to keep the troops well, while the object of a man in private life is to have people sick; of course it is the duty of the military medical officer to use his utmost endeavours to take every precaution he can to preserve the health of the army.

5661. (*Mr. J. R. Martin.*) Hitherto those efforts have not been successful?—Because their recommendations have not been attended to.

5662. (*President.*) Is not this a part of the reason for that,—that there is not an officer whose distinct and sole duty it is to make them?—I do not

believe that they would attend a bit more to him, unless the general officer commanding were compelled by authority to take his opinion, and then he might follow it or not.

5663. Unless such an officer were invested from home with the necessary authority?—Yes.

5664. (*Sir H. K. Storks.*) The general officer would appoint officers for that special duty, and there would be nothing contrary to the regulations in that?—He would hardly do that, I think, without consulting the principal medical officer. I think that the principal medical officer would better make that arrangement.

5665. (*President.*) It is a question of the division of labour among medical officers?—Yes.

5666. (*Mr. A. S. Stafford.*) Would more inconvenience arise from the clashing of the departments, than advantages from the appointment of such an officer?—Yes, I think so.

5667. (*President.*) If an advantage was derived from it, the inconvenience cannot be put against the clashing, as the advantage would be the health of the men?—Yes; but I do not think that it would be found to work.

5668. (*Sir James Clark.*) If you had had an intelligent officer of health in the Crimea, would it not have been very useful and a comfort to you to be able to send him in all directions, and to bring a thorough report to you?—I had that in the Crimea, so far as any precaution was possible; the necessities of the service were our difficulties, it was more than a want of intelligence in the medical officers.

5669. Suppose sickness prevailed ten miles distant from you?—Then it would be your business to go there; you would have a daily report.

5670. (*Mr. J. R. Martin.*) Yet the government were so little satisfied with the arrangements that a sanitary commission was sent out expressly to investigate the matter?—Yes.

5671. (*President.*) Would you appoint a candidate to a staff assistant-surgeon or to a regimental assistant-surgeon in the first instance?—I think it is a matter of indifference; it depends upon where he is going to serve; if he is going to serve in garrison where he is attached to a regiment, it does not matter whether he is regimental assistant-surgeon or staff assistant-surgeon. In the early part of my life I was a staff assistant-surgeon.

5672. The duties of a regiment are more likely to teach a man the work he will have to do than a staff appointment at the commencement, are they not?—That depends upon where the staff officer is employed.

5673. If he is stationed so that he can be employed in a regiment, well and good; but your object is, that he should be employed in a regiment?—With the exception perhaps of the staff assistant-surgeon, to attend to the staff of the department. A man gets a better knowledge of the service by going into a regiment. I think it is a matter of no consequence at first; but I think a man ought to serve in a regiment, and before he is made a staff surgeon I think it very essential that he should be conversant with the duties of a regimental officer.

5674. (*President.*) That is generally done, is it not?—Yes.

5675. (*Sir H. K. Storks.*) Is it not very important that medical officers should know the habits of the soldiers?—Very much so.

5676. And their characters?—Yes; I think that when I was the surgeon of the 33rd I knew the characters of the men better than the colonel of the regiment or the adjutant.

5677. (*President.*) How many years have you been in the inspectorial rank?—Since 1841.

5678. Are there any instructions for the discharge of the duties of an inspector?—I do not know that there are any; there is a general code of instructions.

5679. Published?—Printed or lithographed, I think; it is generally handed down from one principal medical officer to another in the office.

5680. Do they limit the extent to which the inspector should interfere with the prescribing officer, for example, in the treatment of a patient?—You are enjoined to supervise, and I do not think that there is any great difficulty in that; and unless something is very outrageous, you do not interfere; doctors are an irritable class.

5681. I suppose a regimental surgeon or a staff surgeon is as good a medical man, professionally speaking, as he is at any time of his life?—Perhaps he is.

5682. He, having the care of the patient from the beginning practically, is more likely to know what is good for him than the inspector who is not acquainted with the former stages of the case?—Yes; that is true, but things may strike you; it is not done offensively; you would say, Do not you think so and so? and, Have you tried so and so?

5683. You would not make a man adopt a mode of treatment which he evidently disapproved of?—No; I do not think it would work well for the inspector, for it assumes responsibility. The regimental surgeon may be very good, but it does not follow that the superior officer may not be quite as good; and he may see a line of practice pursued that he does not think right, and that the patient does not improve under, and he would merely suggest, Do not you think that so and so would be better? It is done in that way.

5684. (*Mr. A. Stafford.*) It was stated in evidence by a regimental surgeon, before the committee on the army medical department, "A surgeon can get an order from a staff surgeon of the first class, from a deputy inspector, or an inspector general, as to the amount of food that he shall give the patient, as to the amount of medical comforts that he shall give to the patient, and as to the medicines that he shall prescribe for the patient. Now, in private life that would not be tolerated; a man would consult in private life, and not be ordered." Is that true?—I should say not. At least it might so happen in military subordination. I do not mean to say that he could not say so, but you must take the practical working of the department, and not take what might happen.

5685. (*Sir H. K. Storks.*) Still it depends upon the man, and not upon the system?—No. If a man were a competent surgeon, he would say, "If you enforce that line of treatment, I do not feel myself responsible."

5686. (*President.*) A surgeon would think twice before he made that remark to the inspecting officer?—He might.

5687. Is there any truth in the statement that generally obtains, that the tone of the inspecting officers to the officers under them, is rather an unbecoming one? It is very authoritative?—That would depend upon the individual.

5688. Their tone is rather like that of a combatant officer giving the word of command?—No; I do not think that is complained of; at least I have had a great deal of experience, and I have not found it so. You must make them do their duty. It is your duty to see that the regulations of the service are observed. I do not mean to say that men may not complain of being made to do their duty; but you may have men that require to be looked after. Every regimental surgeon is not perfection, but no man would interfere with another who did his duty conscientiously; but you may be compelled not only to insist upon a man doing his duty, but to report him.

5689. Do you make those reports confidentially or publicly?—The director-general has no means of knowing the diligence of officers except through the reports made to him by the head of the department on the different stations. They are made periodically and confidentially generally once a year. They are so far confidential that nobody would care if they were published to-morrow. It is a painful thing to do, as I have had, to report a man; but I have always

*Sir John Hall,
K.C.B.*

*Sir John Hall,
K.C.B.*

22 June 1857.

told him, I feel it my duty to report you, and I would advise you to be more cautious in future.

5690. You tell the man what the complaint against him is?—Yes.

5691. Is that the invariable practice?—I should think that, generally, no man can be reported upon who does not know himself that there are grounds for it.

5692. (*Dr. A. Smith.*) So far as your experience goes, when you have made those reports, have you not frequently known that a medical officer who has been unfavourably reported upon has received an admonition from the director-general, and been informed that unfavourable reports had reached him, and if he persevered in his improper conduct, it must prove very detrimental to his advancement in the service?—Yes.

5693. (*President.*) If the director-general appoints only by seniority, what object is there in knowing the character of the officer?—I do not think it would work well to take seniority alone.

5694. (*Dr. A. Smith.*) Supposing it was taken, would it not be necessary that the director-general, who has occasion from time to time to appoint a man to a special station, and not where he was getting promotion, should know that he was not appointing an indifferent, careless, and idle man?—Yes.

5695. Therefore it is necessary, if it has not reference to promotion, that the director-general should still know the characters of the men?—Yes.

5696. (*Mr. J. R. Martin.*) Are you aware whether your system of confidential reports is the same as that made use of in the army with regard to military officers?—Pretty much the same, I think.

5697. (*President.*) Has it not been held that in the army it is a matter of course to communicate to an officer against whom a confidential report is made, the nature of the complaint made against him?—That is, if it is a thing of gravity, I think it would be.

5698. You say that you do not approve of the principle of seniority as a rule for promotion?—I think that it would be found an inconvenient rule; distributed as the army is over every quarter of the world, you might find it particularly embarrassing to the service.

5699. In the upper ranks, the inspectors' ranks, all the promotion is now made by selection, is it not?—No, I think that seniority is consulted as well.

5700. That is, it is an element in the ground of selection?—Yes, and I think it is fairly so.

5701. But the rule, speaking broadly, is selection for the rank of inspector, is it not?—In some cases it is, in others it is not.

5702. (*Mr. J. R. Martin.*) Ought not the rule to be absolutely this, that it should be seniority, all other things being equal?—The senior officer being equal he would get it. You would select him, but supposing that the director-general wants an officer for a particular service, he might not consider the senior officer in the service a competent or deserving man.

5703. Then would it not be right to pass him over?—That would be a case of selection. I think that promotion is very fairly distributed now. It must be a combination of both. If you make the promotion purely a matter of seniority in an extended department like the medical department of the army, the men would not have that inducement to exert themselves which they ought to have.

5704. (*President.*) Take the case of a man passing from the rank of assistant-surgeon to that of surgeon, is that done by selection or by seniority?—I think that seniority guides it almost always.

5705. Not entirely?—Not entirely. If you take the whole of the promotion for the Crimean war, I think that the system of giving promotion by seniority has been very fairly observed.

5706. Had you any power of promotion in the Crimea?—No, I could only recommend.

5707. Upon what principle did you recommend them?—If it was not seniority, I recommended for

special qualifications the men that I found very competent and very deserving.

5708. (*Sir H. K. Storks.*) Men who had distinguished themselves?—Yes.

5709. (*President.*) You were guided very much by the spirit of the reports that you had received yourself?—I was guided by what I had observed of the individuals.

5710. I understand that in sending the confidential reports your rule has been, never to make a report against a man without communicating it to him?—I do not think that I have ever done it.

5711. (*Mr. A. S. Stafford.*) You feel quite sure that you never reported against a man without informing him that you had done so?—I do not know that I made any confidential reports from the Crimea all the time that I was there, so that the rule was in abeyance there; but in other stations where I made my annual confidential reports I did so.

5712. (*President.*) If they are so valuable, surely in time of war, when there was great opportunity of seeing what men were, that was just the moment when confidential reports would be of the greatest value?—If you look at my list of about 700 officers, it would have been a very laborious thing to do.

5713. Still, you say that the duties of your office were not such but that you could exercise the duty of a sanitary officer?—Yes, but it must be understood that the whole of the sanitary duty is not to fall upon me. No principal medical officer can himself do the whole of the work of the army. He must depute others, and depend upon those under him.

5714. (*Mr. A. S. Stafford.*) If in such an important position, with the health of the army suffering so much, and public attention being called so much to it, you made no confidential reports, surely the value attached to confidential reports must be considerably exaggerated?—I made reports of individual officers that I recommended, but I did not make a general confidential report.

5715. (*Dr. A. Smith.*) When you saw eight or ten medical officers doing their duties exceedingly well, were you not in the habit of mentioning them to me from time to time in letters?—They were mentioned, not only to you, but to Lord Raglan after every engagement, and I could show you a list of the officers whose names I submitted at the end of the war to General Simpson.

5716. Therefore, when you say that you did not make confidential reports, you mean, that you did not comprise in your report all the medical officers serving under you?—Yes, the confidential report in which you embrace every person under you, that report I was not called upon to make, and I did not make it.

5717. (*Sir H. K. Storks.*) Did you report unfavourably of certain officers in the Crimea?—I may have given my opinion.

5718. (*Mr. J. R. Martin.*) When you say that your own practice was always to inform an officer of whom you had reported unfavourably, you still declare that such is not the rule of the service?—I think it is, in the ordinary inspection reports that you make.

5719. Is it a written and published rule of the service?—It is an understood rule.

5720. (*Dr. A. Smith.*) On an occasion when a promotion takes place of a man to a higher grade, do you not find it your duty, occasionally, to inform me how he performs his duties in that higher grade, and whether he gives satisfaction or not?—Yes.

5721. Are you aware that Lord Raglan and other general officers sent home confidential reports to the Commander-in-Chief during the war of every officer serving in that army?—That I do not know.

5722. (*Mr. J. R. Martin.*) Have you ever known in the course of your service an instance of an assistant-surgeon being passed over in the promotion to a surgeoncy of the regiment?—Yes, I think I have.

5723. Was he removed from the service?—No.

5724. Ought he not to have been removed from the service?—That is the question. He might not have

done anything that would authorize his being removed from the service, and yet he might not be a desirable person to promote to the surgeoncy of a regiment.

5725. If you declare an assistant-surgeon not fit to be promoted to a regimental surgeoncy, is not that so grave a matter that it should imply the necessity of his removal from the service?—No, I do not think that. You might put him on half-pay. It might be a very hard case.

5726. (*President.*) You would give all cases of promotion from assistant-surgeon to surgeon by seniority, barring only unfitness?—Yes, I think so. I think that that has been the practice. I do not believe that there are half a dozen instances during the whole of the promotion in the last war where men have not been promoted in their turn, except those individuals who were far away, and where they would not have desired it, for instance in India.

5727. Does that apply to the rank of assistant-surgeon alone?—To surgeons. I think that seniority was followed out there. Certainly it was followed out, and some men were promoted by seniority that I would not have selected had I had any voice in their recommendation.

5728. So far as the good of the service then went, you could have made a better choice by selection?—Yes.

5729. From the surgeon to the first-class staff surgeon, you think that generally seniority rules?—I think that it has been very much guided by seniority; taking the general rule, I think seniority has had its fair consideration.

5730. When you say that taking the general rule, do not you think there ought to be some intelligible line drawn that certain ranks should or should not be promoted by seniority, and that certain ranks should or should not be promoted by selection, or that there should be a specific number in each rank, say one in three by selection, and the other two by seniority; for is it a good system where it is professedly seniority that you should find by some arrangement or other that the men promoted are not the seniors?—I do not think that it has ever been professed in the medical department to be one of seniority purely, except in the ordnance, and that was very much complained of.

5731. Your opinion is decidedly in favour of selection?—I think it would not be advantageous to the service to prevent the director-general from making a selection.

5732. First of all, you consider that it causes great emulation when there is a hope that merit will get its reward—and secondly, for the good of the service you get the best men in the highest places?—Yes.

5733. But, now do you think there is no difficulty in carrying selection into effect; has the director-general the means of judging who are the best men?—Yes. He has this kind of means. He cannot know them individually; he must be guided much by the reports made to him of individuals. He would fairly and naturally, I suppose, to obviate any partiality or any injustice to any particular individual, take three or four or five of the last confidential reports upon that officer. That would be a very fair test for him to judge by.

5734. Do you think that an examination of the case books afford any insight into an officer's qualifications for an assistant-surgeon?—It cannot be, and I do not think it does.

5735. Why does it not?—Perhaps the men have drawn on their fancy; and except you are overlooking a man you do not know what the case may be. It may be a very scientific record of the case, and yet not be a very correct one.

5736. But the register as it stands now is not of much value as a test?—So far it ensures attention, and is a proof of that attention which you cannot enforce in any other way.

5737. Should you not say that it was easier for an idle young man to describe a case that he sees than to invent one?—Yes, of course it is not impossible that he might do that, but then a young man is

supposed to be under his surgeon, and you enforce it more with a view to ensure a particular amount of attention on his part.

5738. Is it not made rather too diffuse, and is not the attention divided too equally between important and unimportant cases in the register?—An officer is not called upon to make those reports in trifling cases that he is in serious cases; he makes his report every second or third day; in a chronic case it is merely to show that he has seen the man, and that he has been under his supervision; but in serious cases it requires that it should be very much left to his discretion; it is difficult to draw a line. If you say the assistant-surgeon is merely to put on record serious cases, then you must leave him to determine that and he will put down nothing perhaps.

5739. (*Mr. A. Stafford.*) The case may turn out to be serious when it is too late to record the whole of it?—Yes.

5740. (*President.*) You would trust to the confidential reports, and you think that from them the director-general would know the character of the officers?—Yes, if they are confidential reports, and if they are honestly made to him, they are not intended to injure a man, but to give the director-general a general idea of the way in which the officers have performed their duties. I think it is necessary for him to know that.

5741. (*Mr. A. S. Stafford.*) Where would be the harm of communicating to the officers those confidential reports?—You might let the men read them, I think, but it would not be pleasant to them or to you.

5742. (*President.*) You say that you do that always yourself?—If I have had occasion to report a man in my yearly report, I have generally told him.

5743. Merely that you were obliged to report him?—Yes.

5744. (*Dr. A. Smith.*) Does not a man know generally what he has been doing?—Yes. No man is ever reported who attends diligently to his duties.

5745. (*Mr. A. S. Stafford.*) But the confidential reports are not confidential reports if they are generally known?—They are not generally known. A man generally knows that he has been serving badly.

5746. Would there be any objection to placing them on the same footing with the reports relating to the combatant officers?—They are pretty much the same. If there is anything that makes a man objectionable, the director-general always admonishes him, but if they are trifling cases they are not worth mentioning.

5747. (*President.*) Was there an advantage in the creation of the new rank of first-class staff surgeon?—It was a term that nobody understood at first, they thought it was following the plan of first or second class clerks, used in the public offices. I think the better term would have been surgeon-major, which was a term already in use in the service.

5748. (*Mr. A. S. Stafford.*) There are six ranks now, are there not?—Yes.

5749. Are there too many, do you think?—I do not know, they abolished a rank that was termed assistant inspector, to make the first-class staff surgeon.

5750. (*President.*) But the assistant inspector was obviously an inspectorial officer, and that only, whereas the first-class staff surgeon is an executive officer, except where there is no deputy inspector, and then he becomes inspectorial?—Most of them think that they are administrative officers.

5751. It is the business of people who are interested to persuade them that they are executive?—Yes. I had some discussion with Lord Raglan upon that subject. He wanted them to be sent down in sick ships, and I did send down two or three when the number of wounded was great.

5752. Would there be an advantage in abolishing the rank of first-class staff surgeon?—I do not see any great advantage in it. I would have a staff surgeon. You might increase the number of deputy-

*Sir John Hall,
K.C.B.*

22 June 1857.

Sir John Hall,
K.C.B.

22 June 1857.

inspectors. You do not require a very great number of administrative officers.

5753. Would it not be rather an advantage to get rid of a class whose duties it is difficult to define?—Yes.

5754. Suppose by that arrangement, by suppressing the class of first-class staff surgeons, and having more deputy-inspectors, you could financially speaking keep the expense about the same, would it not be an advantage to the promotion to have more deputy-inspectorships?—Yes, I think so. The first-class staff surgeon is an important promotion.

5755. As there is so much difference of opinion in the profession as to the manner in which a man ought to be promoted from one class to the other, some thinking that it ought to be by selection, but the great mass thinking that it should be by seniority, would there not be some advantage in getting rid of one of the grades?—I do not say that the whole promotion of the medical department should be by selection. I think that seniority always has its weight.

5756. Even in selection, seniority would have a considerable weight, because, *ceteris paribus*, the senior ought to have it; but beyond that, you would not go?—I think that seniority, so far as it has been advisable for the good of the service, has had its weight.

5757. You say that you do not want any great number of inspectorial officers?—No. A staff surgeon is a much more useful man on service in this way, because you can put him in charge of a regiment, or put him in charge of a station where you do not require a first-class staff surgeon; he would think it an indignity.

5758. The other can do nothing which a deputy-inspector will not do better?—No.

5759. Would not the inspectorial duties be considerably lightened if the question of the supply for the hospitals were put more in the hands of the purveyor, and the responsibility of producing everything required by the patient were thrown entirely upon him?—Yes; if you could trust to him; but if the principal medical officer did that, he might be disappointed and left in the lurch.

5760. At present, as I understand, it is impossible to say where the responsibility rests; but if you lay down by your instructions, that for every man introduced into the hospital, the purveyor is to produce everything necessary for the comfort of that one man, that he is to produce every diet and every extra, that he is to be under the control of the medical authority as to anything beyond that, and to be responsible for producing it; you would relieve the medical officer of a great deal of trouble, and you would ensure to a much greater extent than now, that the patient shall be properly provided?—Is the purveyor to be independent of the principal medical officer?

5761. No; on the contrary, I mean this, that instead of the medical officer writing a requisition upon the purveyor for beds and utensils and clothing, as a matter of course the purveyor shall be bound to provide those things for every patient without any order whatever; but if anything is wanted beyond the regulation, that he should obey the medical officer?—Does the question refer to general hospitals?

5762. The instructions would apply to both general and regimental hospitals?—Yes.

5763. Then take the case of a general hospital?—But who is to be responsible?

5764. The purveyor.—Then, suppose that an hospital is opened. There are a certain number of wards that are fitted for patients; those wards are fitted up, and beds are laid down with everything that is necessary; but the purveyor must have somebody responsible; he must have a receipt from the ward-master.

5765. And who is responsible now?—The ward-master who gives the demand for them. Somebody must be responsible, or you would lose all your things. If an hospital is opened the principal medical officer tells the purveyor, you will fit up such and such

wards, and put in so many bedsteads. That implies that he puts in the whole equipment; so many chamber pots, and blankets, &c.

5766. That ought to be so, but it is not so at present, as I understand?—There is this kind of requisition. Somebody must sign a voucher for the stores, in order to be responsible to the purveyor, if he puts them in there; and the ward-master gives his receipt in the shape of a demand for them. You have a slip book, and that is necessary; nothing should be done without it; the ward-master having one from the purveyor; you cannot do away with checks of that kind.

5767. There is no doubt that when the purveyor issues things he must receive some voucher to show that he has supplied them, and the ward-master must be responsible that they are not ill-used in the ward. Why is it necessary for the medical officer to be writing requisitions for things which ought to come by regulation without any order from him?—The purveyor in those days thought that he was not amenable to the principal medical officer, but that he belonged to the Secretary-at-War, and that was the cause of the great trouble and confusion we had.

5768. How did that affect the question—the question was between the purveyor and the patient—did the patient get the things?—He ought.

5769. But he did not. Surely the proper person to hold as responsible and to punish would be the purveyor?—Somebody must order the diet. The medical officer orders the diet, and if he is going to open a ward, the principal medical officer of that hospital ought to say to the purveyor, “You will fit up such a ward,” and that not having been done was one of the sources of difficulty and confusion at Scutari.

5770. Instead of saying I want so many beds, all that you need say would be, I want a ward fitted up for one hundred men. Say that the ward was then fitted up, or a ward for forty patients, everything connected with each bed is supposed to be put in by the purveyor, and it ought to be perfect?—Yes.

5771. If not put in, the purveyor is responsible?—He ought to be, and it would be the fault of the principal medical officer if it was not. The principal medical officer ought to give the order and see that it was done.

5772. (Sir H. K. Storcks.) But the principal medical officer should hold the purveyor responsible?—Yes, that was done, but the purveyor must take the receipt of the ward-master, or whoever was put in charge, as his guarantee. No man who has stores in his custody will let them be put away in that way without having somebody responsible.

5773. The ward-master ought to be for that purpose his servant?—He ought to be.

5774. (Mr. A. S. Stafford.) Is there any change that you would suggest in the relative positions of purveyors and medical officers?—I think that the purveyor ought to be solely and entirely under the orders of the principal medical officer.

5775. (President.) At the same time he ought to have his instructions, and they ought to be so complete that really the medical officer should hardly have any trouble in giving his orders, and he ought to find things done to his hand?—Yes; but the difficulty at Scutari was that you had to create a purveying department; you had one or two men that had certainly been accustomed to the economy of England. I had one gentleman who was running about wringing his hands and saying that his family would be ruined. I was obliged to take the purveying into my own hands, I wrote to Oporto for wine, and Gibraltar, but that was no part of my business. There was a terror of responsibility.

5776. You say that requisitions must be kept up as a check in the field; would the requisition of a surgeon be sufficient for the wants of his regiment, or would it require to be countersigned?—It should be countersigned; you would have the wildest recklessness possible if you did not have them countersigned.

5776. (*Mr. J. R. Martin.*) Do you mean that they should be countersigned by the inspecting officer of the division?—Yes; I have known a regimental surgeon have in the camp in the Crimea eighteen dozen of wine, fifteen dozen of brandy, and twenty-four dozen of porter, and so on.

5777. (*Sir H. K. Storks.*) For the patients?—Yes, nominally; but if that regiment had moved, where would it have gone?

5778. (*President.*) Have you thought of the question of compulsory retirement, with a view to relieve the upper ranks?—It is so now.

5779. Permissive, is it not?—I think it is compulsory so far as this:—some years ago, a certain number of inspectorships were made, and at the end of three years those gentlemen who are appointed to them retire; that is compulsory, I believe.

5780. Do you mean compulsory retirement after a certain age, after 35 years' service?—That would depend upon circumstances, some are old men before others.

5781. As a general rule, would that be advantageous?—Yes.

5782. (*Dr. A. Smith.*) Do you think that any medical officer, after having undergone the varied service that all have necessarily done, ought to be continued as surgeon of a regiment, and liable to have to perform serious operations, ought to be employed after 50 years of age?—No, I think not, his sight would begin to fail.

5783. With reference to the inspecting officers, who are not required to do the same duty, what would be a fair age for them?—I should think about 60 or 62, or 63.

5784. Would 65 be a fair age?—That would be very fair.

5785. (*President.*) Is there any point which occurs to you in the course of what has passed as to which you have any recommendation that you would like to make?—No.

5786. (*Mr. A. S. Stafford.*) What is your opinion about the pay as at present arranged?—I think that our present pay might be increased.

5787. Will you state where you would begin the increase?—I would begin with the assistant-surgeon. I think that in the committee that sat on that subject the recommendation that was made is a very liberal one and would be very satisfactory.

5788. It is recommended "That the pay of the "army surgeons and assistant-surgeons be increased as "may be determined by the executive government, but "this committee is in favour of 10s. per diem as the "pay of the assistant surgeon on first appointment." On the whole do you agree with that?—Yes; I think it would be liberal.

5789. Do you think that the arrangements, with regard to leave of absence, are satisfactory now?—In all departments where the numbers are limited, you cannot have the same amount of leave as the other officers. But I think that the medical officers get leave.

5790. (*President.*) Would it not be an advantage to give them leave of absence after a certain time spent upon foreign stations, that they may come home and study in the hospitals?—Yes, if you could ensure the study.

5791. You could ensure it by a certificate, could you not?—The certificate would be a very feeble proof; but I think almost every one who comes home avails himself of the opportunity.

5792. (*Mr. A. S. Stafford.*) With regard to relative rank, have you any suggestion to make?—There are certain points in it with regard to which complaints have been made; that is, when medical officers are put on boards they have not their proper standing. They are put as junior members; and if their opinion is required on boards, I think they ought to have their proper status on them.

5793. With regard to honorary distinctions, have you any suggestions to make upon that subject?—

The government have now given them, and they are great incentives to exertion, and very gratifying to the department.

5794. You think that that change is an improvement?—Very great.

5795. (*Mr. J. R. Martin.*) A change had become necessary, in fact?—Yes; great dissatisfaction was felt.

5796. The requirements of the service had made the improvement necessary?—I think so.

5797. (*President.*) No man can get the Order of the Bath, I suppose, in your profession unless he has been under fire in the field?—I think that he must have been mentioned in a despatch, and he must have been engaged in front of the enemy, but a medical officer must be under fire occasionally.

5798. A man may be exposed to a great deal more danger in a general hospital at the rear where there is a great deal of contagious illness than in the front under fire, and doing much more irksome duty?—Yes; they would stand their chance. They are not fighting men; but they are exposed to fire.

5799. (*Mr. J. R. Martin.*) The position of the regimental medical officer is, I believe, fifty paces in the rear of the corps in a general action?—No; you generally send one assistant-surgeon in with a regiment; and the surgeon remains in the rear to attend to the wounded. He is generally out of musket range.

5800. (*Sir H. K. Storks.*) Would it be desirable to allow a medical officer under special circumstances to reckon two years' service for one? suppose for instance, that he has passed one year in a very deadly climate, for either service or distinction?—I think so; I think in unhealthy climates that would be a great boon.

5801. (*Mr. T. Alexander.*) In war time would you suggest the same thing?—It would be hard upon others, who have not had the same opportunity to do that.

5802. (*Mr. A. S. Stafford.*) All the medical officers in the front were under fire, were they not, more or less?—Not all.

5803. Were all that were recommended for promotion under fire?—I do not know; I think that most of those that I did recommend were under fire; they were not recommended for that specially, but all the officers that were noticed I reported.

5804. (*President.*) You cannot draw the distinction whether the men were under fire or within reach?—No, that does not form part of your duty; there are certain points that you are obliged to lay down; for instance, in all the assaults I was obliged to order a given number of medical officers into the ravines, and those took up certain positions not directly under fire.

5805. (*Mr. A. S. Stafford.*) But none were decorated but those under fire?—They must have been present at an action, and they were all under fire more or less.

5806. Take the case of Dr. Mouat?—He was in the Balaklava charge. You must be mentioned in a despatch; and after every action it was my duty to bring under Lord Raglan's notice all officers who had been conspicuously noticed, which I invariably did. It is presumed that no man would be so noticed unless he had been on active service.

5807. (*President.*) You approve of the general scale of pay proposed by Dr. Smith?—Yes, I consider it a liberal scale, and it would be satisfactory.

5808. Do you think that the doctors ought to have servants from the ranks?—That was refused, and they increased the pay. I think they ought to have them.

5809. You are allowed the money for a civil servant?—Yes, but we are only allowed for one.

5810. (*Sir H. K. Storks.*) Do the regimental surgeons have servants from the ranks?—Yes, I was only allowed for one servant.

5811. (*Mr. T. Alexander.*) You were entitled to have eight horses?—Yes; but they allowed only 3s. a day for servants, and every servant that I had cost me 3*l.* a month; to one I gave 5*l.* I could not get them for less.

*Sir John Hall,
K.C.B.*

22 June 1857.

Sir John Hall,
K.C.B.

22 June 1857.

5812. (*Dr. A. Smith.*) Is 1s. a day the sum now allowed to a medical officer to provide himself with a servant sufficient?—Not without he is fed.

5813. What would be a fair allowance to enable him to keep a servant attached to him, who might go anywhere with him?—For one servant I think 3s. was fair enough; but you give one servant to all the officers; you give to an acting assistant-surgeon one servant, and one servant to the inspector-general of hospitals.

5814. (*Sir H. K. Storke.*) What does a medical man get now as an allowance for a servant?—One shilling a day.

5815. Does the servant draw rations?—Not here, but you get 1s. 6d. abroad to cover the charge for his rations.

5816. What is the charge?—Sixpence for a civil servant.

5817. (*Dr. A. Smith.*) If the government allowed 2s. a day it would be a fair allowance?—In England.

The witness withdrew.

Colonel the
Hon. J. Lindsay

Colonel the Hon. JAMES LINDSAY examined.

5823. (*President.*) What rank do you hold in the Guards?—Captain and lieutenant-colonel, and acting-major.

5824. Have you ever been adjutant?—Yes, for nine years.

5825. Were you a member of the barrack committee that made a report in the year 1855?—Yes.

5826. You were the chairman of it, were you not?—No; Lord Monck was the chairman.

5827. Do you hold to the opinions expressed in that report?—All except one, which I remonstrated against.

5828. Which is that?—The introduction of spirits into the canteens.

5829. I see that you speak in the report of the necessity of a great change in point of ventilation in the barrack rooms?—Yes.

5830. I suppose you could speak upon that subject from personal experience, having been into the men's rooms at night?—Yes.

5831. What is the state of the ventilation?—It is very much improved so far as my information goes in the last two or three years; but that improvement has been caused by the reduction of four men in the barrack room,—by the diminution in number.

5832. (*Mr. A. S. Stafford.*) Not by any improvement in the ventilation?—There is a new barrack lately erected, which has been just occupied, in the Wellington barracks, which has an improved ventilation, and I hear it spoken favourably of, but I have not had any personal experience of it; the men have not been long enough there to report upon it.

5833. (*President.*) I suppose that your barracks may be assumed to be better than those of the line?—No; I think the reverse; the barracks of the line vary very much in different stations, but we have nothing approaching some of the new barracks that have been built for the line at Sheffield and Preston, the new barrack at Portsmouth, and I think one now building for them at Devonport, but the generality of our barracks are bad on the whole, though they are improving.

5834. You proposed, I see, that in every sleeping apartment there should be an ablution room fitted with basins, and water laid on, and separate portions boarded off where the men could wash themselves entirely; has that ever been done?—Yes; that is done in this new Wellington barrack; there are in each ablution room two places boarded off, but the ablution rooms of the old barracks are all excessively bad, though they have erected in the Wellington barracks, in the old ablution rooms, some baths.

5835. Do the men like to use them much?—Yes.

5836. How do they manage?—They go at different times.

5818. Or in the colonies?—That depends on where you go; the wages of servants vary so.

5819. (*Mr. T. Alexander.*) Do you not think that you might have servants from the medical staff corps?—There is this difficulty; supposing you are supplied from the medical staff corps, if you go to the West Indies and your servant falls sick, what are you to do with him?

5820. (*President.*) Would he not join whatever detachment of the medical staff corps might be there?—I do not know that it would be desirable to send them out there.

5821. (*Dr. A. Smith.*) How would you replace the servant in the meantime?—I say, supposing he is taken sick, what are you to do?

5822. (*President.*) Is there anything that occurs to you upon which you could make any suggestion or recommendation to the Commissioners?—Nothing at this moment.

5837. In the course of the day?—Yes, they suit themselves.

5838. You recommended a change in the means of cooking, to produce variety?—Yes, I think that a very important element in health.

5839. It has been stated by one of your men, a non-commissioned officer of the Grenadiers, that the men are in the habit of sending meat out to be baked, either paying in money for it or by diminishing the quantity of vegetables?—Yes, that is so. They attach great importance themselves to having a variety of messing.

5840. Have you, in the new Wellington barracks, any baking machine?—Yes; and at present it is used more than the boilers.

5841. (*Mr. A. S. Stafford.*) Are the Grenadiers there now?—Yes.

5842. (*President.*) You propose that there should be, besides that, a bakery for baking bread?—Yes, in order that the men may be taught in baking bread; it may be useful for them on service.

5843. Has it ever been done yet?—I think not.

5844. (*Mr. J. R. Martin.*) There is a professed baker now?—I think there ought to be a professed baker in every company when, if they were driven to it, they would have the power and know how to bake bread.

5845. (*President.*) You propose that privies should be provided for the men in the proportion of six for every 100 men, and that the seats should be divided, has that ever been done?—No, except at Aldershot.

5846. Are they still undivided with you?—Yes, they are the same privies as they always have been; there has been no change, but I believe it is intended.

5847. Is there any change in the practice of having the urine tub in the barrack room at night?—No, that still continues.

5848. Is not that a very great nuisance?—Yes, I think that might be abolished with very great facility; there is no reason why chamber utensils should not be provided.

5849. Will not the men break them?—Yes, but the expense is not so very enormous. I have had experience of that at the small barracks at Windsor where chamber-pots were used. We were there about a month, and at the end of that time some two or three were broken. But metal ones might be served out.

5850. And they were paid for as barrack damages, were they not?—Yes.

5851. With regard to games, I see that you have made recommendations for racket-courts and ball-courts?—I think it is a very important element in the health of the soldier, or if I might be allowed to say a few words upon that, I think that the soldier

suffers perhaps more than any living individual from ennui; the very nature of his duty places him in that position; he has not any employment excepting his drill and his duties, and you cannot increase that.

5852. Will you just describe how the day is occupied in your regiment?—If you take London, the soldier gets up at six and breakfasts at seven.

5853. (*Sir H. K. Storks.*) What does he do before breakfast?—There is no drill before breakfast; he makes up his bed and cleans his things; he gets his breakfast at seven o'clock, and he then turns out for drill about half-past seven or eight, as the case may be; he then has his morning's drill, which may last about an hour or an hour and a half. When the battalion finds the public duties, there is no drill except for defaulters; but the men for duty are paraded about ten o'clock. Then that finishes his day's drill altogether; but then there are a certain number of recruits, a certain number of defaulters, and a certain number of soldiers, who are not accomplished in drill, they have it again in the afternoon. Then there is the evening parade, where a certain amount of practice at drill goes on to complete the education of the soldier; that takes about half an hour, and then his time is his own until tattoo, and that is at nine in winter and ten in summer.

5854. (*Mr. A. S. Stafford.*) That is the history of the day of a soldier not on guard?—That is the history of the day of a soldier not on guard so far as regards the duties which he is obliged to perform.

5855. (*Mr. J. R. Martin.*) The whole of the remainder of his time hangs very heavy on his hands?—Yes; then there is something further, there is a certain body of them who are taken off duty for other descriptions of instruction; there is always some instruction going on in the exercise for the minie rifle; we have a company out at a time, and sometimes two companies out at a time; those men are taken off duty, and they have, perhaps, three hours in the morning and three hours in the afternoon at work.

5856. (*Sir H. K. Storks.*) Do not your men go to school?—Yes; but they are not obliged to go.

5857. (*President.*) Only the first six months?—The order till last Saturday was, that a man was obliged to attend school until he was dismissed his drill as a recruit; the time was uncertain, sometimes it was three months and sometimes four; afterwards they were not compelled to attend school until they were non-commissioned officers, and then they were all obliged to attend school. The attendance at school is entirely voluntary.

5858. What is the change now?—That all the men are to attend school until they are dismissed as fit in reading, writing, and arithmetic.

5859. If not fit they will go on attending school?—Yes, until they are dismissed. In consequence of the nature of his position the soldier has necessarily a great deal of idle time on his hands, and of course if he is idle it naturally leads him into mischief, at least he has an opportunity of getting into mischief. If you were to give the men more military occupation, more military duty, it would disgust them and you could not do that; you cannot employ their time in a greater amount of duty than at present, except at Aldershot, where they are throwing up works; if you do that you will disgust them; and the reason of that is that all the soldier has to do is under restraint; it is not like a working man or an artizan, a working man digs and his mind is his own, and an artizan is interested very likely in the work in which he is engaged, but a man in the position of a soldier must give you all his attention, and there is a great deal of physical demand on him in consequence of the weight which he carries; all these things make me think that it would be impossible to ask him to do more duty or drill than he is now called upon to perform.

5860. (*Mr. J. R. Martin.*) Nor would it be desirable, if you could?—No; I think that too much

drill and too much duty are wearisome and fatiguing.

5861. (*Mr. A. S. Stafford.*) Therefore you think that the attention of those who have the welfare of the soldier at heart, should be directed to the means of keeping him out of dissipation in the hours of his leisure?—Yes, exactly; that is what I want to come to; he has a considerable amount of leisure, and I think that it ought to be the duty of the government, and of those who are in authority, to endeavour to provide for him as far as possible the means of recreation. I think that the great object should be that the barracks should be made as far as possible the home of the soldier, and that you should give him pursuits inside the barracks instead of tempting him outside.

5862. Do you consider that that would be conducive not only to his moral, but also to his physical health?—Certainly; I think that the action of the mind would be almost as conducive to health as the exercise of the body.

5863. And that it would diminish dissipation?—Naturally so; I can speak from experience that where you have opportunities of employing the men, you decrease the dissipation; if you give them amusement, they take an interest in it.

5864. (*Mr. J. R. Martin.*) Along with that decrease you have a decrease of illness and crime?—Of crime, certainly, and as to illness, I should think that would follow. It would be rather difficult for me to trace that, because the illness in London, and the illness that one has in the country, where we are able to give them some amusement, are so very different.

5865. (*Sir H. K. Storks.*) You say that your men are obliged to be in barracks at nine in the winter, and at ten in the summer; is the tattoo over at those hours, or does it begin at that hour?—It begins at that hour.

5866. Generally the men are not in until half-past ten in summer, and half-past nine in winter?—Yes, it would be about half-an-hour before the lights are out.

5867. Is that the case wherever the brigade of Guards may be quartered?—No; the usual time in the rest of the army is eight in winter, and nine in summer.

5868. Is that settled by a brigade order, or how?—That has been so from time immemorial.

5869. One would naturally suppose that in a place where there is so much dissipation, there would be an object in getting the men earlier into barracks than in the country?—It is impossible to say what it would have been if it had not been so; I think that in London where you have no hold upon the men when they are out of barracks the chances are that they would stay out. It is only moral control and effect of discipline that keeps the men together in London.

5870. In the Queen's regulations for duties in garrison, the tattoo is to be at eight in winter, and at nine in the summer season, after which no soldier is to be out of his quarters; consequently, London being a garrison, the Queen's regulations as to the barracks of the Guards are not followed?—Just so; but London is not a garrison in the usual acceptance of the word "garrison."

5871. Suppose that a battalion of Guards are in the country, do they return to their barracks at ten in the summer, and nine in the winter, as they do in London?—No, at eight and nine. They conform to the usages of the district wherever they go.

5872. Supposing a battalion of Guards went to Manchester, how would it be then?—It would be whatever the General of the district pleased.

5873. (*Mr. A. S. Stafford.*) How is it at Chichester?—Where we should be alone, we should keep up our London habits.

5874. (*Sir H. K. Storks.*) At Windsor, how is it?—At Windsor the same.

5875. (*President.*) Among the recommendations which you made in this report there is one as to the erection of a day-room in barrack; that was with a view, I suppose, to the occupation and amusement of

Colonel the
Hon. J. Lindsay.

22 June 1857.

Colonel the
Hon. J. Lindsay.

22 June 1857.

the men?—Yes. I think that you want an extra room attached to every one or two companies, or a large room attached to a barrack, where men may be able to sit and read, or play at draughts, or enjoy themselves and smoke.

5876. The question was put the other day to an officer, and he said that he did not see what the men would do with a day room?—We had a little experience of that the other day before the new Wellington barracks were occupied. There were two new school-rooms built in the Wellington barracks for two battalions, and before the new part of the barracks was occupied, the battalion that occupied the old part had the use of the extra school-room, and a very large room it was; I should think 50 feet by 30, that is about double the space that there is in any reading room that I ever saw attached to a barrack. It was watched to see whether this room would be used, and it was crammed, even that large room, so that there was not room for the men.

5877. How was it fitted up?—With forms and benches up and down the room. Now it is a school-room.

5878. Can the men use it in the day as a day room?—Yes.

5879. When do they use it?—They do not use it now; that was before it was opened as a school.

5880. Was it in the day time or at night?—Both.

5881. Was it lighted with gas?—Yes.

5882. (*Mr. A. S. Stafford.*) What did the men do there?—They read, and took their books there, and smoked.

5883. Had they any games there?—Yes; draughts, and dominoes, and those sort of things.

5884. Do you allow cards there?—Never.

5885. You do allow smoking?—Yes, we always allow smoking in our reading rooms.

5886. Do you think that that is a good plan?—Yes.

5887. (*President.*) Do they get coffee?—I should think most likely they do. There is another battalion there now. We did that in our own reading room, but it has been discontinued since the establishment of an evening mess.

5888. Of all the causes to which the mortality in the Guards is attributed, the night duty is the most prominent, is it not?—I should say that it was the most prominent, other causes assisting it.

5889. That is, the bad plan of the barrack, and the dissipation of the men?—Yes.

5890. Those being the three causes of mortality?—Yes.

5891. Will you describe what amount of night duty in the Guards is?—At the present moment it runs about four nights in bed to one out.

5892. That is, at the Wellington barracks?—That is among the three battalions doing duty in London.

5893. (*Mr. J. R. Martin.*) From one year to another?—The year round. That is more than we used to have.

5894. (*President.*) Does that include the time that they are out of London?—No. Then they have little duty to do.

5895. How is it at Windsor?—That is fully as hard as in London, because one battalion is doing duty every day.

5896. Is the night duty of the battalion doing duty at the Wellington barracks, the same as that of the battalion doing duty at the Tower?—In consequence of the reduction of the sentries in the Tower, the Tower duty never was so light as it is now.

5897. The guard at the Bank is sent from the Tower?—Yes.

5898. (*Sir H. K. Storks.*) How many nights in bed have the men at the Tower?—Four.

5899. (*President.*) One night on duty and four in bed?—Yes.

5900. That is very light, is it not?—Yes; we think it so. But my own opinion is, that under any circumstances, particularly where the duty is constant, it never ought to be under that.

5901. (*Sir H. K. Storks.*) It is lighter than the line; the average of the line does not come to anything like four nights in bed. I think it is three nights in bed?—But it varies. The duty is as hard at Portsmouth. I do not think it is as hard in Dublin; but it is at Plymouth, and at some other stations; but then at a great number of stations the duty is not hard. It is very little more than barrack guard at by far the majority of stations.

5902. (*President.*) In speaking of this number of nights in bed there has been a considerable change since you were adjutant in the Guards?—It has been reduced. I remember it three, and two and a half it has been on occasions.

5903. Now it is habitually reduced to the number you have mentioned?—Yes; it is about four I think.

5904. Is that occasioned by the diminution of that duty, or an increase of the strength of the battalions?—A little of both.

5905. So that any fluctuation in the bayonets would increase it again?—Yes.

5906. (*Sir H. K. Storks.*) Have you any inlying picket?—Yes; but they go to bed.

5907. Are pickets out at night looking for absent men?—Yes; not all night. After a certain time they know it is impossible.

5908. But they do go out when men are absent at tattoo?—Yes.

5909. (*President.*) How is this night duty done as to the hours; how many hours is a man on sentry duty at a time?—Two hours.

5910. And then he is relieved?—Yes.

5911. How long is it before he goes on again?—The guard is divided into three reliefs; he is four hours off and two hours on.

5912. (*Mr. A. S. Stafford.*) Is the state of the guard-rooms satisfactory?—No. I think that they are very unsatisfactory; they are not ventilated at all.

5913. (*President.*) A man goes to sleep in the guard-room before he goes out?—Yes.

5914. He lies down in his great coat and goes to sleep?—Yes.

5915. And the room is very hot and close?—Yes.

5916. And then he goes out into the open air, having been perspiring in his sleep?—Yes.

5917. Have you watch cloaks in the guard-room?—Yes.

5918. (*Mr. A. S. Stafford.*) Do you think that some sentry stations are more unhealthy than others?—I should think that some of them are.

5919. (*Sir H. K. Storks.*) Have you any notion of the cubic space allowed to each man in the guard-room?—No.

5920. (*Mr. J. R. Martin.*) Have the improvements in ventilation that you speak of as having been introduced into the new Guards barracks been applied to the old ones?—I do not think that there have been any alterations in the old ones; but there is a greater extent of ventilation, as it appears to me, in the new barracks than there was in the old.

5921. (*President.*) Do the men suffer in barracks through more being put in a room than it is intended to contain?—Not now. It has been the case to a very considerable extent in many stations, that the commanding officers have found, that in consequence of the deficiency of barrack accommodation they have been obliged to put more men in a room than it was told off for. That, of course, added naturally to the inconvenience, and to the vitiated state of the atmosphere.

5922. (*Dr. A. Smith.*) Do you know whether medical officers have ever found it necessary to represent that as having happened?—Certainly, they have represented it to the commanding officers, and the commanding officers have represented it, and in some cases the commanding officers have been obliged to reduce the numbers, but it has been always caused by a deficiency of barrack accommodation for some

Colonel the
Hon. J. Lindsay.

22 June 1857.

particular objects, which drove them to put more men in a room than they ought to have done.

5923. (*President.*) To give more space to non-commissioned officers?—Until lately there was hardly any room told off for non-commissioned officers—married non-commissioned officers and pay-serjeants. They have stores, and you must find some place where they can live with their wives.

5924. Do you take any women into the barracks at the Wellington barracks now that you have your model lodging-house?—We have the serjeants. There is more married accommodation provided now than there was previously.

5925. But those who marry with leave are put into the lodging-house, are they not?—Yes; if they choose to go in.

5926. Do they choose it?—Yes, they have been very well filled lately.

5927. Do you maintain in the Guards the rule of not giving leave to marry except to a limited number?—Very strictly; we adhere to that in all the Government allowances, but if a man marries without leave and keeps up his character for two or three years afterwards, and he is generally speaking a good soldier, we give him a share in the company's washing to keep him.

5928. (*Mr. J. R. Martin.*) Is not the number which every room will properly hold written on the door by the engineers' department?—Yes.

5929. You never exceed that number?—We have not now that there is more accommodation; but we have had 18 men in a room for 16.

5930. (*President.*) The lodging-house is entirely under the management of the regiment, is it not?—Entirely under the management of the officers of the brigade.

5931. It was an arrangement made by yourselves out of your own funds?—Yes; we raised the money to build it.

5932. (*Sir H. K. Storks.*) How much a week do they pay for this accommodation?—From 2s. to 3s. 6d. The rooms vary in size.

5933. (*Mr. J. R. Martin.*) Is it esteemed a great boon by the men?—Yes, it is now; they were afraid of it at first; they did not like to go in at first not knowing that they would have their full liberty there in the same way as if they had been in lodgings.

5934. (*Mr. A. S. Stafford.*) What is your opinion of the present knapsack, could it be improved?—I have seen so many attempts at improving the knapsack which have failed generally, but my own opinion is that the best knapsack that I ever saw put upon a soldier's back is Berrinton's knapsack.

5935. (*Mr. J. R. Martin.*) Has not it been proved absolutely by a practical test to be unexceptionable?—We have tried it ourselves, and the men individually who have tried it have reported favourably of it, and I think the best plan would be to serve it out to 500 men and let them wear it.

5936. (*President.*) The great point is in the slinging of it, rather than in the knapsack?—There is a strap that is fixed at the back of the knapsack on the one side, and to a yoke upon the other; the yoke is in the front, and the weight strikes the man down perpendicularly upon the cross of his body.

5937. (*Mr. J. R. Martin.*) But it is suspended higher than the old knapsack?—Yes; in consequence of this purchase it is higher, and you get the weight the better, and there is one additional object in it that a man is unfettered in his arms. The weight of the present knapsack presses very much upon a vein, and he gets numbed from the knapsack strap pressing constantly on the vein of the arm.

5938. (*Sir H. K. Storks.*) Is it better to carry the great coat flat or rolled on the top?—I think it is better rolled.

5939. Does not that make it much hotter, as there is no circulation of air?—One would say yes, to that; but at the same time, if you consult the men I think they would prefer it rolled.

5940. Is there not this disadvantage, that when a man has been out all night, and his great coat gets wet, it is next to impossible to roll it?—We have abolished the old roll, and established a new roll. The disadvantage of the old roll was, as you have just now said, that it always required two or three men to do it; but we have established a new roll, which is not so beautiful, but which is equally effective; and I think as to the wet, we have often had it put up when wet; there is a little more difficulty then, but I think that that objection falls to the ground in the new description of roll.

5941. He carries it on his pack, does he not?—He did so, but not now.

5942. (*Mr. J. R. Martin.*) Can a man roll it up himself?—Yes.

5943. (*Mr. A. S. Stafford.*) Do you think that the shape of the shoes is the best that could be worn?—I think, generally speaking, that the blucher, if it does not fit well, is a very inconvenient thing to walk in.

5944. (*Sir H. K. Storks.*) Would a laced boot be better?—That takes time.

5945. What do you think of the great coat, is it a serviceable garment for the soldier; would not a lighter description of coat and made of a better material, be better for marching and for parade?—I prefer it as it is at the present moment.

5946. (*President.*) It has been suggested that whatever the boot is it should be capable of being laced over the trousers, so as to gather the trousers in and prevent them from catching up the mud, as the French do their gaiters; would that be a good plan?—I should hardly think so, and for this reason, that when you wear a boot with the trouser over the boot, you would not be able to get it comfortably tight round the ankle.

5947. I mean a laced boot in lieu of the blucher?—I prefer a gaiter, if you could give it them.

5948. (*Sir H. K. Storks.*) Then you would have the inconvenience of lacing it?—Why not have the gaiter and the blucher? The shoe is not a good thing.

5949. Do you consider that socks are essential as part of the soldier's equipment, or that a man would be equally serviceable without them?—I think that he would be equally serviceable without them, but as an article of cleanliness on home service, of course I should not like the sock done away with.

5950. (*President.*) If a man's leather shoe or boot is wet, is not a woollen substance between the wet leather and his foot an advantage to him even if that is wet too?—I never tried it, but a great number of the men who enlist have been in the habit of never wearing shoes even, and many march without them.

5951. (*Dr. A. Smith.*) Would not a man's feet chafe if he had no sock on?—I should think that a darned stocking was a considerably worse thing than to have none at all. I think that on service you would very soon have your stockings all in holes.

5952. Have you often found that when a man's sock got worn out on the march his toes got chafed by the leather?—Yes. It appears to me that that is rather a question of experience, and it is difficult to conjecture what might be the result.

5953. (*Sir H. K. Storks.*) What do you think about flannel shirts; do you think that they are better than cotton shirts?—Yes, I do; but it is not popular.

5954. You would do away with the cotton shirt?—Yes; and substitute flannel.

5955. (*President.*) Your men wear a flannel waistcoat under the cotton shirt, do they not?—Some do, but it is not general.

5956. (*Sir H. K. Storks.*) That is a private arrangement, and not a part of the soldier's necessities?—Yes, unless it is ordered by the surgeon.

5957. (*Mr. T. Alexander.*) On service you would always have flannel?—Yes.

5958. (*Mr. J. R. Martin.*) You would advocate a flannel shirt everywhere?—Yes; I think that with the duties that the soldier is called upon to perform,

Colonel the
Hon. J. Lindsay.

22 June 1857.

where they have heat and cold to encounter, flannel shirts are best.

5959. You say that it is not popular among them?—No; the moment that the men could go back to cotton they did. Flannel is more expensive, but it would last double the time that cotton does, and it is cheaper in the end. I think that a flannel shirt would be a higher price than two of cotton. It is not so smart either, and a flannel shirt becomes rather a dirty-looking article, do what you can.

5960. (*President.*) When you say it is not smart looking, it is worn underneath?—A soldier likes being clean in barracks as much as he does out.

5961. (*Dr. A. Smith.*) Is it not rather more bulky than a cotton shirt?—Yes, it is more bulky.

5962. Does not it accumulate more dirt than a cotton shirt? the urine drops on a flannel shirt and stains it?—Yes, there is more difficulty in washing it, but if there was a higher class of washing that might be avoided.

5963. (*President.*) Do you think that it would be an advantage to the soldier to have one uniform stoppage, combining the present commissariat stoppage and his messing stoppage, and that you should supply him with everything requisite for his three meals?—There is one part of the soldier's mess which he is excessively fond of laying out for himself, and that is his vegetable money.

5964. He does not buy it at the canteen?—He goes where he pleases with us.

5965. I think a description was given to us that he bought his butter and herrings himself at the canteen, but the company settled where he should get his vegetables, and they were bought by the pay-serjeant?—Yes, the company select where they shall buy those articles, and then the corporal and swab, representing the company, and the cook the kitchen, go for them.

5966. When the army went to Bulgaria that system broke down, did it not?—Yes.

5967. It was forced on the commissariat, who were not used to that work, and they did not do it very successfully; would it not be an advantage to make as little change as you can, so that you should have the system in peace as like as possible to that in war?—Yes, so that there would be no changes when the war commenced.

5968. The men have gained, have they not, in point of quality in the supply since the bread and meat have been supplied by the commissariat?—They have gained in one way, in cheapness.

5969. Have they not had meat of a better quality?—We have never had any complaints of either system.

5970. (*Mr. T. Alexander.*) Would it be better to give the soldier a sufficient ration to keep him in health, than to let him purchase what he may not be able to get as his ration?—I think so, as a system of general policy. I think that there is a satisfaction which the soldier has in adding to the luxury of his own mess. Sometimes they stop their vegetables; sometimes they have a very small quan-

tity of vegetables, and the extra money for the vegetables goes to pay for the baking of their messes.

5971. That is a disadvantage surely, as a certain quantity of vegetable food is necessary, in proportion to the amount of animal food, and if the men with a view to get their dinner baked stint themselves from vegetables they do themselves harm?—An exceptional day would do them no harm.

5972. It is a question of degree, but still on that day a man does not get that vegetable food which he ought to do?—No, but at the same time this is to be remembered, that unless some improved system of cooking is given to us, and the government should serve us out with vegetables instead of the soldier buying them, then we should have nothing else but Irish stew day after day.

5973. I assume that the government supplies in every barracks ovens as well as coppers, so that they might have alternately baked and boiled food?—I think that as a matter of policy, to avoid a change upon service, you must put it all on one system.

5974. You would then have a great diminution of accounts, as there would be no such thing as stoppages?—Yes. It would be 7d. a day instead of 4½d. The men's pay would be 6d. and the ration under all circumstances.

5975. (*Dr. A. Smith.*) Do you think that the allowance of three quarters of a pound of meat for one of your stalwart men is sufficient animal food for him daily?—Yes, I think it is with all the other extras that he adds to it, his soup and his vegetables.

5976. The soup takes away the strength of the meat?—Yes; I do not think it is enough. I know that this happens, that we are obliged to work the meat so as to give in the course of seven or eight days a fair turn to each company as to the amount of bone, consequently some days they are short of absolute meat. They may get enough soup, but I think it is hardly enough of meat.

5977. (*Mr. J. R. Martin.*) It is necessarily very deficient on active service?—Certainly, much more so.

5978. (*Mr. T. Alexander.*) There would be one advantage on active service if you established a certain ration, that you would have vegetables and everything there, which while in the field at times you cannot get. Would there not be an advantage in that?—Certainly.

5979. (*President.*) Do they ever leave any of the meat?—Yes, they do sometimes at dinner, and finish it at other times.

5980. Do you suppose that that is from their being weary of the monotony of it?—Yes, I do; and from their having no appetites, the want of appetite being caused by the hot barrack-room at night, and a certain amount of night duty which affects the constitution.

5981. (*Mr. T. Alexander.*) At the same time the food not being sufficiently varied, palls the appetite?—Certainly; that is a very important point. It ought to be constantly varied.

The witness withdrew.

Adjourned.

Wednesday, 24th June 1857.

PRESENT :

The Right Hon. SIDNEY HERBERT, M.P.
A. S. STAFFORD, Esq., M.P.
Colonel Sir H. K. STORKS, K.C.B.
Dr. ANDREW SMITH.
T. ALEXANDER, Esq., C.B.

Sir THOMAS PHILLIPS.
Sir JAMES CLARK, Bart.
J. R. MARTIN, Esq., F.R.S.
Dr. JOHN SUTHERLAND.

PRESIDENT, The Right Honourable SIDNEY HERBERT, M.P.

ALEXANDER JAMES MOORHEAD, Esq., examined.

A. J. Moor-
head, Esq.

24 June 1857.

5982. (*President.*) What office do you hold at Chelsea?—That of secretary to the commissioners and registrar of out-pensioners.

5983. How are the commissioners constituted?—By patent from the Queen.

5984. Consisting of whom?—At present there are the four secretaries of state; the paymaster-general is the chairman of the board. I am not quite sure whether Sir Benjamin Hawes now is one.

5985. The secretary-at-war I suppose is now, only he is merged into the office of the secretary of state?—Yes, the following is a list of the commissioners: The president of the council, the first commissioner of the treasury, the four secretaries of state, the paymaster-general, the governor and lieutenant-governor of Chelsea hospital, the adjutant-general and quarter-master-general, the deputy secretary at war.

5986. The paymaster-general is always the president?—Yes; he is vice-president of the Board of Trade as well.

5987. The secretary of state for war has no other authority than that of an individual member?—As a commissioner only.

5988. The men who apply for an out-pension, at Chelsea, have been invalided and discharged before?—Yes; with just this difference, that there are a number of days left, to be filled up from the date of their discharge at Chatham, or elsewhere, until the pension is fixed, which is every Tuesday.

5989. You have nothing to do with the discharge, or the invaliding?—Nothing whatever.

5990. Were they ever discharged at Chelsea?—In very bygone days, when the Commissioners had the power of transferring them to veteran or garrison battalions, I can see that they gave them a pension, or ordered a man to any particular battalion.

5991. That was done away with?—Yes.

5992. And the discharge of soldiers, at Chelsea, was done away with about 20 years ago?—Yes; when Lord Howick was secretary-at-war, a number of members of Parliament had complained of the nuisance of men coming there from Chatham; I should mention, that the invalid dépôt was formerly at Chelsea.

5993. Why was that done away with?—It was done away with so far as the men were concerned who were received at the invalid dépôt, because of the necessity of quartering them in the neighbourhood of Chelsea for two or three days. They were billeted in the low public-houses about.

5994. What is the present practice?—The present practice as regards all the men that arrive at Chatham—and those form about three-fourths of the whole of the men invalided—is for them to be taken to the invalid dépôt at Chatham.

5995. Do the household troops attend?—Yes; all the men of the guards, both horse and foot, attend in person at Chelsea hospital. All the invalids discharged from the army in Ireland, with the exception

of those from the Guards, appear at Kilmainham and are seen by the governors, who report upon their cases to Chelsea.

5996. In the East Indies is that so?—In the cases of men discharged in the East Indies, Cape of Good Hope, and the other colonies, for the purpose of residing there, their discharge documents are forwarded to the commissioners.

5997. In those cases the discharge papers are sent to you, and you judge what the rate of pension should be?—Yes; it is done by the secretary-at-war, who conveys Her Majesty's authority to dispense with their personal attendance.

5998. In Ireland, that is the rule?—All men discharged in Ireland are sent to Dublin for the purpose of appearing for examination before the governors of Kilmainham hospital.

5999. No pension is granted in Ireland?—No, they are granted by the commissioners of Chelsea Hospital on a recommendation from the governors of Kilmainham.

6000. Do those recommendations confine themselves to the invaliding, or do they recommend the rate of pension?—They recommend the rate of pension according to their view of the warrant, but which rate is frequently changed by our board.

6001. Do you secure for the colonies, England, and Ireland, a perfect uniformity in the rate of pension?—Yes, as far as we can; that is the great object.

6002. What becomes of the men between the time of their discharge and the time when your decision is made as to the rate of pay?—All the men at Chatham, or at Woolwich, and I presume the Guards in the same way, receive at the rate of 20 days' pay, and in Ireland 24 days' pay, and they have a passage provided for them home. We notify that through the War Office, and we inform them the rate of pension fixed upon, and the staff officers of pensioners then receive instructions to pay them at the end of those 20 or 24 days.

6003. Are pensioners in Canada, Australia, New Zealand, and Van Diemen's Land always paid from the office of pensioners?—Yes, in Canada, not at the Cape. In Van Diemen's Land and New Zealand they are. At the Cape of Good Hope they are paid through the commissariat, and in India through the East India Company.

6004. What number of cases come before you annually?—They have varied very much lately. For the 10 years ending December 1854, the average number was about 4,000 men. In 1855 there were examined at Chatham 3,217. At Chelsea, of the household troops, 336; at Kilmainham 280; artillerymen who were seen at Woolwich 463; upon dispensing authority 237; to reside abroad 117; negroes, and from other sources altogether in that year, 5,155. Last year 1856, 8,943, owing to the war and the reductions, and this year up to the present date we have had 4,457.

A. J. Moorhead, Esq.

24 June 1857.

6005. Were those reductions all made for disability?—Yes, combined with service, or for service alone; but many then, besides the numbers above enumerated, were discharged direct from their regiments at the late reduction, without their cases coming at all before the commissioners, in consequence of general unfitness for service as soldiers and having served but a short time.

6006. (*Sir H. K. Storks.*) No man appears before the Chelsea board, unless he has a right to a pension?—Yes. Of the numbers I have mentioned, there were in the year 1855, 337 rejected, and in the last year there have been 1335 rejected.

6007. They claim the pension, but it does not follow that they get it?—No.

6008. No man discharged for short service, or for any cause that does not entitle him to a pension, appears before the board?—A man has little choice about it. He is sent to us by the desire of his commanding officer, who rather thinks that he has a claim. We have many cases years after a man's discharge, in which he does claim, and we say, Why did not your case come forward at the proper time? Sometimes that happens, as it did on the reduction after the Peninsular war.

6009. (*Sir Thomas Phillips.*) In the ten years which averaged 4,000 a year, were the numbers pretty equal in each year?—Very nearly equal for ten years; and it might have been some years before that.

6010. The difference was not great in those ten years?—No, it was not.

6011. (*President.*) As I understand you, there are no pensions granted by anybody except by the Chelsea Commissioners?—None whatever.

6012. Is that found to be very useful for persons making inquiries as to the existence of pensioners?—We have an immense number of inquiries after pensioners in consequence of all their discharges being deposited in Chelsea hospital, and it affords great facilities. We have inquiries from all departments, from the War Office, Commander-in-Chief's, from the adjutant-general's office, &c.

6013. Have you experienced any difficulties as to a decision upon the merits of each case which could be removed in any way?—With regard to the manner in which disabilities are described, that is to say on the old principle, we do very frequently meet with difficulties by their not stating distinctly in cases of accident how it occurred; whether it was the effect of service or not. Dr. Maclachlan is better able to answer the Commissioners upon that point than I am, as it is more his duty; but it is equally mine to see that the man has a claim on account of service.

6014. (*Sir H. K. Storks.*) Do not you get a medical report in every case?—Yes; but they are very frequently not sufficient; very often a man is sent home from the colonies rather for treatment. They are not sure that he is going to be discharged, and the report that we then get is of his state while at the invalid dépôt; but they frequently do not know there the cause of the accident.

6015. (*Sir Thomas Phillips.*) Do you supply the imperfection in your own record by adding what is defective?—We gain many particulars by seeing the men in person at Chatham, and record it in every instance. Dr. Maclachlan and myself are very particular upon that point.

6016. (*President.*) Are there any cases in which men are sent up to you for decision as to the pension in which you think that their attendance might fairly be dispensed with?—There were about 500 men in 1855, and there was nearly the same number in 1856 discharged on the completion of their periods of 21 years' service. Under the regulations the commanding officer must get first the authority of the adjutant-general for discharging a man.

6017. Do not they prefer to come and get discharged for disability, as they get 2*d.* more?—No, they get no more for ordinary disability.

6018. Do they not generally contrive to produce a disability worth 2*d.*?—In many cases there is no disability, and they are discharged because of completing their period of service. I believe the feeling is rather that they would appear, as they term it, before the Commissioners at Chelsea Hospital. As to a great number of those men, when a ship arrives from India, with some 200 invalids, they may have 20 on board of this class, but they cannot stop the ship at Plymouth to put them out, and on they go to the invalid dépôt, but all those men who have completed 21 years service in infantry and 24 in cavalry might be discharged without appearing in person.

6019. Whenever limited service men come upon the pension list after having served 21 years, those men would be all entitled, without any question, and without disability?—I am not able to say what particular bargain would be made with them, but I presume so.

6020. I mean that they will have their discharge as a matter of course at the end of 21 years' service?—No; I cannot say what the Government will do, but I presume they will all have their regular rates of pension.

6021. There would be no question as to the discharge with them as now?—No; there is no man now who can claim his discharge; they, I presume, could.

6022. (*Sir Thomas Phillips.*) The men who can claim their discharge at the expiration of 21 years may be discharged simply by the commanding officer?—Not without a dispensing authority from the secretary-at-war.

6023. Is that obtained?—Yes, if the adjutant-general recommends it.

6024. (*President.*) What is the number of in-pensioners at Chelsea?—The establishment is 538, and casualties are filled up quarterly.

6025. Have you many more candidates for admission than you have vacancies?—We have generally about three times the number. We do not seek for candidates, it is quite voluntary on the part of the candidates. They apply through the staff officer of pensioners, who is furnished with forms; this period of the year is generally rather slack.

6026. What are the annual vacancies?—About 60.

6027. What is the number of annual candidates?—Three times that number, there are about 60 casualties that arise from death, and there are men that wish to leave the place.

6028. And the candidates are greatly in excess of the number of admissions?—They are fully upon the average three times the number.

6029. What are the rules with regard to the admission of in-pensioners?—I will hand in this memorandum showing the qualifications.

The same was handed in.

“MEMORANDUM of the Qualifications necessary to be possessed by an Out-pensioner of Chelsea Hospital in order to render himself eligible for Admission as an In-pensioner of that Establishment, and explanatory of the Course pursued on Applications for Admission being received at the Hospital.

“ QUALIFICATIONS.

“1st. The board have fixed 55 years as the minimum of age on admission, and 21 years in the infantry, or 24 years in the cavalry, as the minimum period of service, entitling an out-pensioner to admission as an in-pensioner, where the claim is preferred solely on account of age and long service.

“2*d.* But in the cases of candidates applying on account of the loss of one or more limbs, or severe bodily wounds, or other injuries or disabilities, the result of foreign service, disqualifying them from labour, there is no restriction as to the period of service or age of the applicant, but the board are governed in their selection by the peculiar circumstances of the case.

“3*d.* In all cases good character, both in and since discharged from the service, are essential requisites,

and in selecting from among the candidates to fill up the vacancies caused by death or otherwise, the board invariably give the preference to those men who have borne the best character and served the longest period abroad.

"Course pursued on Applications for Admission being received:—

"On receipt of a personal or written application from an out-pensioner for admission as an in-pensioner, the secretary, as a preliminary step, delivers or forwards to him a printed form to fill up, requiring him to state certain particulars regarding his age, service, &c., &c. (see copy of said form annexed). But the staff officers being supplied with blank forms, a majority of the applications are received directly through them.

"The vacancies caused by death, &c., are filled up quarterly, except in any special case of distress or disability, when, if eligible and there is a vacancy, the candidate is admitted on the first of the following month, provided his out-pension has not been issued to him beyond the last day of the preceding month, which fact is first ascertained from the staff officer of his district by the secretary. On the board day appointed by the commissioners for investigating the claims of the candidates and admitting those selected, the man's application, the staff officer's report, and any other testimonials, together with his discharge documents, deposited in the secretary's office at the time of his admission as an out-pensioner, are submitted to the board.

"Prior to being received into the house, married men are required to show that their wives and families are provided for, or at least that the parish authorities will prefer no claim on that account in the event of their being admitted.—Royal Hospital, Chelsea."

6030. (*Sir Thomas Phillips.*) Is there any limit as to age?—We do not take a man in on account of service under 55; then he is required to have served all his period. Of course in the case of wounds the wounds are considered, and age is then out of the question; but where it is a question of age and service 55 years is the minimum.

6031. You take them at any age for disability?—Not young men, we do not volunteer to take them, but if a man has his arm or leg off, we cannot very well reject him.

6032. (*Mr. A. S. Stafford.*) Is there any difficulty in letting them go on the out-pension again?—Not the slightest, the board never raise any difficulty at all.

6033. (*Sir H. K. Storks.*) Do the men avail themselves of the privilege of going out again?—They come in to serve themselves, and the number that go out on request are very few; I have a statement here showing that. This number was taken only yesterday or the day before, the vacancies were filled up yesterday, but they are not included in this; the average age of the men now in the house, taken yesterday, was 70 years and 8 months; their average service 15 years; the average rate of pension was $8\frac{1}{2}d.$ when they came in. I will hand this paper in.

The same was delivered in and is as follows:—

RETURN of the average Age, Service, Rate of Pension, &c., of the In-pensioners, Royal Hospital, Chelsea, June 22nd, 1857.

Average age, 70 years $8\frac{1}{2}$ months.

Average service, 14 years $10\frac{1}{3}$ months.

Average rate of pension, $8\frac{1}{2}d.$

6034. (*Sir Thomas Phillips.*) Will you state the number that discharge themselves; is it inconsiderable?—Probably there may be upon the average four or five men in a quarter, not more; and as to the men that are dismissed, if a man disgraces himself we put him out; I should say four or five upon the average in a year.

6035. (*Mr. A. S. Stafford.*) What number are dismissed in a year?—I do not think above three or four on the average for bad conduct, men making themselves disagreeable to their comrades, or for drunkenness.

6036. (*Sir H. K. Storks.*) Have you many defaulters in the hospital?—It is a question that I can hardly answer, that is under the governor entirely.

6037. (*President.*) Is there any other matter that occurs to you on the subject of the pension, or with regard to the papers that are produced, that you can suggest to the Commissioners?—There is a form that is made use of which I will give in if the Commissioners please. It is a form that the candidate fills up, and it generally comes through the staff officer.

A. J. Moorhead, Esq.

24 June 1857.

INFORMATION necessary to be furnished by an Out-pensioner of Chelsea Hospital, who wishes to become a Candidate for Admission on the In-pension.

State your christian and sur-name, and the regiment from which you were admitted a pensioner, the rate of your pension, and the date of your admission on the pension list - - - }

Mention any other regiment in which you have served - - }

Have you ever served abroad? if so, state where, and the period of such service - - - }

If you have served in any action, state the name of it - }

If you have been wounded, state in what part of your body, and in what action you received the said wound - - - }

If you have a wife or family, state how they will be provided for in the event of your being admitted an in-pensioner - - }

What is your precise address, and in what staff district do you receive your out-pension? - - }

Do you belong to the local company? }

We hereby certify that the general conduct of since he lived in this parish, has been and in the event of his being admitted an in-pensioner, the parish will have no claim upon his pension.

_____ { *Minister and Church-wardens of* } the Parish of _____

I certify that _____ is not labouring under any degree of mental derangement, nor infected with any contagious disorder.

Surgeon.

The above-mentioned _____ has been paid his pension up to _____, and his character has been _____; and I have no reason to believe, either from inquiries made by me, or from any circumstances which have come to my knowledge, that he has exhibited symptoms of insanity or of weakness of intellect, to such an extent as to incapacitate him from taking care of himself.

Dated _____
Staff Officer of Pensioners,
District.

N.B.—This form is to be returned to the "Secretary of Chelsea Hospital," as directed on the other side.

6038. I meant as referring to an applicant for an out-pension?—The feeling of our board is that the minimum of the rate for wounds is too high, and the board would better perform their duty if there was nothing fixed between the minimum and the maximum rate, leaving them to fill up what should be given.

6039. Do you keep at Chelsea a record of the deaths of the out-pensioners?—We have a record of

them because it is highly necessary, as we have such an immense number of applications, but that lies more now with the War Department; it comes from the staff officer, and we have a duplicate of that return for our own use.

6040. (*Dr. A. Smith.*) Do you think that any disadvantage would result to the government if the men were to be pensioned in the colonies where they are serving at the time?—They are so pensioned; all that request and wish to be; we have a great number of them.

6041. But that principle cannot be generally understood?—It is perfectly understood by the commanding officers.

6042. A long correspondence has been referred to me for the purpose of ascertaining whether I saw any objections to men being discharged from the service with a view to their remaining in New Zealand and Australia?—Authority would be sent out for their discharge, and their discharge documents would be sent to us. Generally speaking they are men of 21 years' service.

6043. But below that service?—We have cases of that kind, but not generally; I do not think from want of its being known.

6044. Would there be any objection to that rule being extended?—I consider not upon good evidence, but we ought to have better and fuller medical reports than we have; those that come from any distance ought to be very full indeed.

6045. In that case, if they were very full, you do not think that the government would be losers by permitting men of those years' service, who were unfit for further service, to be discharged on the spot?—On the contrary they would be gainers, as far as the conveyance home was concerned; and the men would be benefitted if they wished to reside there.

6046. (*Sir Thomas Phillips.*) You require that the evidence shall be clear that they are unfit for service?—Yes, the general commanding appoints some board for the examination now.

6047. (*Dr. A. Smith.*) Are you aware that a number of men who are discharged from Chatham afterwards apply to be re-enlisted?—I possess no means of answering this question.

6048. (*President.*) The only cases, as I understand you, in which you think that the appearance of the men who are now brought to Chatham might be dispensed with, are the cases of those men whose service has expired and who claim pensions for service and not disability?—I do not mean to say that in the cases of some men of short service, having disabilities, such a course might not be carried out, but I doubt whether it would be a satisfactory one.

6049. With regard to a man whose claim to a pension is founded upon injury or disability, do you think it would be impossible to draw a line, and that all had better appear?—I think so; a different opinion has been expressed, but I must confess that I do not see my way very well through it; I think that the men should be brought forward in every possible instance; many things arise that we are not cognizant of before we go to Chatham.

6050. Did not the pension warrant of 1829 enjoin upon commanding officers an accurate statement of the causes of accidents?—Yes, it did.

6051. That was omitted in the warrant of 1848?—Yes; I think that many commanding officers imagine, in consequence, that it is not required.

6052. Have you experienced any disadvantage from that?—There were three cases in one regiment yesterday of men who had been in the Crimea after the war was over, getting injured, and the detail of those injuries, if looked into at the moment, I am satisfied would have been most beneficial to the public interests and the men too.

6053. Have you got with you any account of the cost of the ration of the in-pensioners?—Yes, this (*producing a paper*) shows the ration itself.

The same was delivered in and is as follows:

STATEMENT showing the QUANTITY of PROVISIONS supplied daily to the IN-PENSIONERS of Her Majesty's Royal Hospital at Chelsea. 22nd June 1857.

A. J. Moorhead, Esq.

24 June 1857.

Beef or Mutton.		Soup.	Bread.		Pota- toes.	Morning Meal.			Evening Meal.			Butter.	Porter.	Supplied Weekly.			Remarks.
lbs.	oz.	pints.	lbs.	oz.	lbs.	Cocoa.	Sugar.	Milk.	Tea.	Sugar.	Milk.	oz.	pints.	Cheese.	Flour.	Beef Suet.	
—	13	1	1	—	1	$\frac{3}{4}$ oz.	$\frac{3}{4}$ oz.	$\frac{1}{8}$ pint	$\frac{1}{8}$ oz.	$\frac{3}{4}$ oz.	$\frac{1}{8}$ pint	1	1	$\frac{1}{2}$ lb.	5 $\frac{1}{2}$ oz.	1 $\frac{1}{2}$ oz.	

N.B.—The Establishment is told off into Six Companies, two of which receive roast meat every day, consequently each man receives roast meat every third day; the day the men receive roast meat they also receive one pint of soup. A liberal allowance of oatmeal, potherbs, salt and pepper for the soup, daily; mustard served out every beef day, viz., Sundays, Tuesdays, and Fridays; mutton on Mondays, Wednesdays, Thursdays, and Saturdays. Every Sunday the men receive half a pound of suet pudding.

On the Anniversaries of Her Majesty's birthday, the Restoration of King Charles the Second, and Christmas Day, 18 ounces of the best roasting beef, with one pound of plum pudding, and one and a half pint of porter extra on these occasions, is furnished to each man. The men employed as cooks and in the laundry receive each an additional pint of porter daily.

6054. What is the whole cost of the men, including the establishment, but not the original cost of the building?—Taking the whole expenses, the governor and all descriptions of officers, deducting therefrom that portion which I consider belongs to the out-pension, I have made a calculation, not taking in the expense of the building or hospital repairs, which came to 2,000*l.*, under our own management, and it is a trifle less than 25*l.* a year each man.

6055. (*Sir Thomas Phillips.*) What part of that would be establishment charges?—I have not separated it in that way, but the average cost of a man's ration comes to 10*d.* now.

6056. What do you supply to a man besides that 10*d.*?—We supply him with clothing and a daily rate of pay.

6057. What is the daily rate of pay?—It is very small; we have a serjeant-major and two quarter-master-serjeants at 2*s.* 6*d.* each per diem.

6058. What do you pay the pensioners themselves?—The colour-serjeants receive at the rate of 9*d.*; the company sergeants, of whom there are 24, 7*d.* Then there are corporals at 4*d.*, drummers, 2*d.*, and the men get 1*d.* Then there are 50 men who get 2*d.* a day and 50 who get 1 $\frac{1}{2}$ *d.* per day, and the clothing is about 4*l.* per annum.

The witness withdrew.

Dr. MACLACHLAN, examined.

Dr.
MacLachlan.

6059. (*President.*) What office do you hold at Chelsea?—I am physician and principal medical officer of the establishment.

6060. Will you describe the duties that you perform at Chatham, with a view to fixing the rate of pension of the discharged soldier?—The invalids are brought forward at Chatham for my examination. I then see them individually and take notes of their precise condition at the period that they appear before me, taking particular notice of the disability, the degree of disability, and its character, and whether it has been produced by service or by any other cause.

6061. That is the whole question that you have to decide?—Yes.

6062. You have nothing to do with his fitness for discharge?—Virtually nothing, but my instructions authorize a veto.

6063. You could remonstrate?—Yes, according to the instructions I have a veto, but I do not exercise it, because I consider that these men having been found unfit for further service by the regimental surgeon and by the district staff surgeon, and having subsequently undergone a thorough examination at Chatham, and their discharge being recommended by the staff surgeon of the division, and subsequently approved by the principal medical officer, there the warrant is, I think, sufficient.

6064. All that you have to do is to advise the Commissioners as to the money value of the disability which a man has got?—Precisely so.

6065. How do you do that? do you judge merely from your observation of the man himself, or do you have any medical reports of him?—In the list that I take down with me to Chatham there is an extract from the discharge documents giving an account of the disability which a man labours under.

Then I examine him to ascertain whether this disability really exists, or whether he has any other, and the amount of it. In my examination, it frequently happens that I get evidence which has been omitted in the discharge documents—evidence which a man gives on his finally being brought forward, which I know is the sort of evidence that will satisfy the commissioners, and I of course take a note of it.

6066. How is this discharge document compiled? is it taken from the medical registers in the hospitals where he has been?—I presume so. The regimental surgeon enters in the discharge document a brief history of the disability of the man, and I presume that is taken from the medical registers generally but not always.

6067. Do you often apply for a sight of the medical register with a view to ascertain more fully the man's disability?—No.

6068. Is the medical register of much use to you?—None whatever.

6069. It has been stated that one of the reasons for keeping it in a very voluminous and minute form is the advantage which is derived from it when men are invalided?—I never see this very voluminous and minute register; I am not guided by it.

6070. Then it must be for the officer at Chatham? For the regimental medical officer.

6071. You know the registers, do you not?—Yes, well.

6072. Do you think that the manner in which they are drawn up is the best for the purposes intended?—I think that it is an extremely irksome affair altogether. I think that a number of cases are entered in that register which might be well omitted.

6073. Would you trust to the admission and discharge book for ordinary cases which have no peculi-

Dr.
Maclachlan.

24 June 1857.

arity about them?—I would, and I think that the director-general could, in half an hour, construct an admission and discharge book which would give every satisfaction.

6074. Still it would be necessary to have a register for the purpose of ensuring that the officer took accurate notes of any thing peculiar that came under his observation?—Assuredly, I think that all cases that are likely to unfit a man for service, or disabilities likely to entitle him to a pension should be faithfully and carefully recorded in that register.

6075. (*Mr. J. R. Martin.*) And all cases that are of a serious nature must be?—Yes; or likely to turn out to be of a serious nature.

6076. (*President.*) Then you provide for two objects, one to give a good medical history of the man as applicable subsequently to his discharge; and the other would be for medical and scientific purposes, as a record of the disease and its treatment?—Yes; with the understanding that many cases might be omitted. A man may come into hospital for a day or two in consequence of a slight catarrh, or he comes in from the effects of a boil, and trifling maladies of that description, which are now necessarily entered in the register. A good admission and discharge book would serve all the purposes of these and like cases, and save an infinity of labour. In short, the medical register is an extremely troublesome affair, and recording in it trivial attacks is a mere waste of valuable time.

6077. Are there any other documents of which you would make the same complaint, as to their complicated character or length?—I am not aware of any so important.

6078. Has it, in your experience, been observed that medical officers are overlaid with returns?—I think so, decidedly.

6079. And that much might be done to simplify and to save trouble in that particular?—I conceive that a good deal might be done.

6080. You state that you think the register is very irksome; is it not very useful?—It is very useful in certain cases when it is done, but I do not think that it is ever done very satisfactorily, for this reason, that no officer will enter reports day after day of the course that a common boil is taking, or the course that a slight and insignificant cold is taking, though he is obliged, according to the instructions, to give a daily statement of the progress of the most trifling malady.

6081. (*Sir Thomas Phillips.*) By what rule would you define the cases to be recorded with minuteness and particularity, and those to be omitted?—I would say that all cases of a serious character, and all injuries likely to incapacitate a man for service, ought to be very carefully recorded.

6082. What would you record?—I would record the whole history of the case, its origin, &c.

6083. And the treatment?—Yes.

6084. (*Mr. J. R. Martin.*) The rule should be the importance of each case?—Yes.

6085. (*Dr. A. Smith.*) Then who should judge of the importance of each case; the young assistant-surgeon?—The surgeon and also the assistant-surgeon.

6086. Generally the assistant-surgeon is absent with a detachment, and separated from the surgeon; whom would you leave it to then?—I would say that an assistant-surgeon who was fit to take medical charge of a detachment ought to be able to judge of the severity of a case such as should be entered in the military register.

6087. Do you think that he would not be very apt to say, to avoid trouble, that it was not a case that required it?—I think that you might obviate that by laying down a rule that when a man has been under treatment eight or ten days his case should be taken *de novo*, and some brief record given of that case.

6088. (*Mr. J. R. Martin.*) Besides that, he is serving under the surgeon?—Yes, and responsible to

his superiors. Dr. Smith spoke of a medical officer on detachment. I consider that a medical officer who is sufficiently competent to take charge of a detachment of men is surely sufficiently competent to judge whether a case is worth entering or not.

6089. (*Sir Thomas Phillips.*) I understand you to say as to all cases you would record the fact that the man had become sick on a certain day, and had become well on a certain other day?—A discharge and admission book would be sufficient for that.

6090. Are the Commissioners to understand you to say further that you would make the medical officer responsible for the cases that he would include in a more minute and particular register?—Yes.

6091. You would leave that to be done at his own option?—I would leave it to his own judgment.

6092. There you would have the progress of the disease chronicled day by day and the treatment too?—Yes, exactly. There are many cases where it is not necessary to record the changes more than once in three or four days; only in very acute cases is a daily report necessary.

6093. (*Dr. J. Sutherland.*) You would give the medical officer discretion?—Yes; I would give the medical officer a little more discretion; and as a check I would take care that no case should be longer than ten days or a fortnight in hospital without a full record of it being entered in the medical register.

6094. (*Sir Thomas Phillips.*) But you might have very serious cases that would not occupy that time?—I think there are very few that do not run longer than that which do not show themselves at once.

6095. I understood you to say that you would give the medical officer discretion as to what cases shall be recorded with minuteness and particularity?—Rules should be laid down. For example, when a man receives such an injury as may ultimately disqualify him for service, though very insignificant as relates to the man's probability of recovery, that injury ought to be most minutely recorded, with a view to the future.

6096. (*Mr. J. R. Martin.*) The medical officers are as responsible to their superiors for the manner in which they conduct and carry on their returns as for any other part of their professional conduct?—Most assuredly.

6097. (*Dr. A. Smith.*) You mentioned boils. You said you thought that they ought not to be entered. A case occurred a few months ago; Dr. Taylor having written to me from Chatham as to a man who showed a mark on his leg, which he said was from a wound which he received at Sebastopol. There was a doubt about it, and application was made to me to ascertain from the surgeon of the regiment whether it was a wound or not. The surgeon of the regiment had no record, and the consequence was that we were not able to ascertain it. The man persisted in saying the mark on his leg (the people at Chatham considered it was positively the mark of an old boil) was a wound, and that man was discharged under the assumption that it was a boil; it might have been a wound?—I meant that your admission and discharge book would at once tell you whether it was a wound or a boil; I would say a boil on the leg or on the arm.

6098. There might be several other marks on the leg before that one, and in that case how would you know whether it was the boil referred to?—I should think that any medical officer who falls in with a man wounded in action would, if he had not an opportunity which he is not at all likely to have to keep up his medical register on active service, record minutely in the admission and discharge book such information as would meet the case that you allude to.

6099. (*Mr. J. R. Martin.*) But that case would involve simply a neglect of duty and nothing else?—Yes.

6100. (*Dr. A. Smith.*) How long were you in the service?—Thirteen years before my appointment to Chelsea, during 12 of which I was a regimental medical officer.

Dr.
Maclachlan.

24 June 1857

6101. From your experience would you believe that taking the whole body of medical officers they are conscientious in the discharge of their duties?—They are, but I am quite satisfied, from my experience, that the medical register is not kept agreeably to the instructions issued by the medical department of the army, because the great majority of cases that occur in a regimental hospital are exceedingly unimportant; and that a medical officer should be obliged day after day to give the history of a common boil, for instance, with the whole details of the treatment including diet, is a duty that is never done, though demanded by the regulations.

6102. (*Mr. J. R. Martin.*) You believe that the complicated nature of the register, as it now exists, is a great temptation to an officer to neglect his duty, and you would simply record the admissions and discharges?—I am satisfied that it is so; and I am further satisfied that a great deal of information necessary for the future history of the individual, or for his discharge, such as would be available, as checks, could be obtained from a well-constructed admission and discharge book.

6103. (*Mr. T. Alexander.*) You could make it under different heads, and tabulate it so as to show the course of treatment. "The name, date of admission, age, disease, discharge," and so on; a short abstract of the treatment and when he was discharged in one line?—As I said before, I think that the director-general might, in the course of half an hour, construct such an admission and discharge book as would in the majority of cases be perfectly satisfactory both to the medical officer and to the public.

6104. And it would be held as a great boon by medical officers?—Yes.

6105. (*Dr. A. Smith.*) Do you think you are right in saying that slight cases are required to be recorded daily?—When I kept a medical register, as a regimental medical officer, there were instructions to record daily, the progress, &c., of each case. A register of the same kind is in use at Chelsea Hospital, but I do not exact or expect this. I am not aware what the instructions are, if any, that may have recently been issued on the subject, but I know that during the 12 years I was with my regiment it was an imperative duty to register every case, however insignificant it might be, to record daily any change, and to specify the treatment, diet, &c.

6106. (*President.*) Will you read the instructions?—"The following directions for keeping the medical register are to be particularly attended to. The christian and surname of each patient, with his rank, regiment, age, disease, and date of admission should be first entered; and next his place of birth, trade, general appearance, and peculiar temperament, with his previous diseases, and their dates and places; if a recruit, it is to be stated whether he has been previously vaccinated or inoculated. Should mercury have been exhibited in large quantities for previous complaints, the diseases for which given, its effects at the time, and its apparent connexion with his present disease, are to be stated. To these should succeed a full detail of the symptoms, from the nature of which the character of the present disease inserted at the heading of the case, is considered to be established. Among the appearances to be noted at this place should be the state of the animal and vital functions in all acute and in several chronic diseases, the countenance and posture of the patient are likewise on many occasions important to be noted, as affording diagnostic marks; the state of the pulse, skin, tongue, stomach, and bowels, seat and degree of local affections, and the probable causes, complete the history of the case on first admission. The prescriptions are to be in Latin and at full length. In the proper column are to be inserted the rate of diet and the extras ordered daily. Each subsequent report should refer to the symptoms of the preceding day, and the action of the remedies prescribed should be specially noticed." Only imagine such information being exacted in the case of a man admitted with a common boil, or in the

slight cases I have referred to! The very copying of the directions would take half an hour. These are the instructions that were in force in my time when I was attached to a regiment. I see they are dated 1855.

6107. (*President.*) You have a paper before you which is in use in the Guards. That is the admission and discharge paper; would that meet the object which you think should be attained by a document of that description?—I think it might be better than this. I think it might be more full with very little additional trouble.

6108. (*Mr. J. R. Martin.*) Without rendering it more troublesome or complicated?—Yes. Some time ago, I was going to remark, I took the trouble of examining the admission and discharge book of almost every hospital in London with a view of forming an admission and discharge book for my own infirmary, and I found that no two hospitals agree.

6109. (*Mr. J. R. Martin.*) You took an abstract of the whole that you thought best?—Yes.

6110. (*President.*) Will you have the goodness to send the commissioners a sheet of your admission book?—Yes. But the admission and discharge book at Chelsea would not apply to regiments, inasmuch as it enters minutely into the cause of a man's discharge, the length of service, and his period of admission into the house.

6111. Will you prepare a sheet as you think it might be done in the service?—I will, with pleasure.

6112. Do you agree with the statement made by Mr. Moorhead as to the necessity of sending all cases to Chatham when a man's claim is founded upon disability?—There is no doubt that it possesses an advantage, but I think that in many cases the present system might be dispensed with. I think it is a most extraordinary arrangement, that a man who has undergone amputation of a thigh in the north of Scotland should be sent to Chatham to be examined by the principal medical officer to ascertain whether that man is fit for further service. It also appears to me dilatory, expensive, and unnecessary that men who have completed 21 years' service in the infantry or 24 in the cavalry, and who have been found unfit for service by the regimental surgeon, should be sent up, perhaps, from the very places in the north of Scotland to which they return as their permanent homes.

6113. If it was a soldier who happened to be quartered in Scotland he would be sent to Chatham, and then go back to Scotland?—Yes, if he gave in that as his residence.

6114. How would you draw the line with regard to this, because there are cases of amputation which carry very little disability with them, it might be a finger?—I will explain shortly the proceeding in invaliding a man.

6115. (*Sir H. K. Storks.*) Who constitute the Board at Chelsea?—The parties that usually attend are the paymaster-general, almost invariably. He is the chairman. Then there is the governor of the hospital, General Sir Edward Blakeney, the lieutenant-governor, General Sir Alexander Woodford, and on special occasions, perhaps the adjutant-general, and the quartermaster-general; always three.

6116. (*President.*) What is the process that you were going to explain?—The regimental surgeon, having found a man unfit for service in concurrence with the commanding officer of the corps, reports the case to the general commanding the district; he then, at the half-yearly inspection, sees them along with the principal medical officer of the district, say a staff surgeon; if they concur in the opinion of the regimental surgeon and the commanding officer, the adjutant-general approves, and the man is sent to Chatham for further examination. After being there for some weeks, and the case being decided upon by the principal medical officer, the discharges are sent to Chelsea by the adjutant-general. Then I go down and examine the man as to the points to which I have already alluded, the precise nature of his disability, the extent of it, and the manner in which it

*Dr.
Maclachlan.*

24 June 1857.

has been received so far as I can get testimony, and subsequently, the case being decided upon by the Board of Commissioners, the man is discharged from the service.

6117. What is the change that you would make in the regulation?—I should say that, in the cases I have just referred to, the finding of the principal medical officer on the station would be quite sufficient, with an instruction from the director-general, that in all cases the history of the man should be most faithfully recorded. The instructions that are issued by the director-general, and the injunctions of the Commissioners in the heading of the discharges are very clear, but, I am sorry to say, they are not always followed with that degree of accuracy and care which I consider necessary.

6118. You would not dispense with the attendance at Chatham altogether?—Not altogether. Only in those cases of palpable disability, where a man is clearly and indisputably unfit for further service—such a case as a man who has undergone an amputation of a thigh, or an arm, or a leg, or the case of a severe compound fracture, and all men who have completed their third period of service.

6119. (*Sir T. Phillips.*) Would not this answer, that upon a description of the cases, an account of them being sent to you, the authorities at Chelsea should notify that certain cases might receive their discharge without being sent to Chatham, and that certain other cases should attend at Chatham and undergo an examination?—I think it would be better that it should go through the director-general, who has a knowledge of his officers, and who would take care that the rules of the service were strictly adhered to, that in all cases a history of the disability was carefully recorded.

6120. Whom would you make responsible for having an examination in A's case, and dispensing with it in B's case.—The principal medical officer at the station.

6121. You would not require him to send an accurate description of the case to some authority here who would say, I am content with that description, discharge A, and send B up to Chatham; who should do that?—The director-general.

6122. (*President.*) Or his statement might come to you?—I think that it should go through the director-general. That would be quite a new system.

6123. At present do any of those things pass through the director-general's office?—Some do.

6124. At present the director-general has nothing to do with the invaliding of the troops?—His officers have, and he receives the reports or returns.

6125. What are the annual deaths among the pensioners at Chelsea?—It is about 12 per cent. Upwards of 60, about 65 is the average number.

6126. Is the sickness very great among them?—Necessarily, because they never come to Chelsea Hospital till they are suffering from some chronic malady, and until they are broken in health and infirm.

6127. Have you many bed-ridden men?—About 15 in number now; we have 60 or 70 cases always in the infirmary; the worst description of cases are taken into the infirmary.

6128. You have got a new system of ventilation in the old men's wards and water-closets at Chelsea?—A number of plans have been tried recently. One has been introduced that was recommended by Dr. Arnott; but I do not think that I should like to say much about it. I conceive that the experiment has not been fully tried.

6129. Do you think that it is favourable so far as it goes?—Yes; but I do not think it suited to Chelsea Hospital.

6130. What is it?—He has introduced what is called the smokeless grate, the peculiarity of which is that the coals are contained in a box at the bottom, and are raised by means of a lever as they are consumed. The fire being lighted at the top, the bitumen and gas escaping from the heated coal underneath,

passing upwards through the ignited surface, are burned. Running below the flooring, in a straight line to the nearest point, there is a shaft which communicates with the external air, and supplies the fire by a guarded opening below the fender. Another shaft, a zinc tube, six inches in diameter, extends along the ceiling from one end of the ward to the other, and opens into a box communicating with the chimney. From this shaft there are funnel-shaped tubes, which enter the men's berths and water-closets. A draught is created by the heated chimney. The water-closets are so contrived that in opening the door there is a rush of water into the pan.

6131. (*Mr. J. R. Martin.*) And the consumed air is carried off?—Yes.

6132. (*Dr. Sutherland.*) What is the effect of that upon the air in the berths and water-closets?—I do not think it answers; I think by that means you do away in a great measure with the advantage which an open fire place has; you supply the fire-place with the air from without instead of its coming into the ward at all, and the men are in fact respiring the very air that is being deteriorated.

6133. Has it the effect or not of keeping the air in those berths and water-closets sweet?—Yes.

6134. (*Mr. J. R. Martin.*) You are sensible of a change?—Yes.

6135. (*Sir T. Phillips.*) How can it have that effect if it does not consume the vitiated air?—It draws out the air, so to speak, but the great thing seems to be that it heats the apartment with very little fuel. I cannot conceive myself that a sufficiency of fresh air is brought in.

6136. It does not produce cold?—No.

6137. (*Sir J. Clark.*) Do not you find that the air which comes through that tube spreads itself through the room?—No, it is brought under the grate, and the objection at Chelsea is this, that the old men cannot manage the grate.

6138. Dr. Arnott was obliged to adapt the plan to the peculiarities of the hospital?—Yes.

6139. Do you find the air sweet in the wards?—In the ward where the experiment has been tried the air is certainly sweeter; it has always been one of the sweetest wards in the place. In the infirmary there is no particular system; there are open windows and fire-places, louvre panes, Arnott ventilators, and permanent openings over the doors.

6140. (*Mr. A. S. Stafford.*) How are you appointed?—By the Sovereign, on the nomination of the paymaster-general.

6141. Are there any qualifications necessary?—You must belong to the army.

6142. Is any period of service necessary?—Not that I am aware of.

6143. Is there any medical supervision over you; are you under the director-general?—In no way. I have the instructions here that were issued to me, in which I am requested to communicate with him in the cases of the invasion of any severe epidemic. There is one instruction here that has become obsolete, that is:—"On a death occurring, after reporting it to the commissioners, you will send a history of the case as extracted from the registry book, with the treatment pursued, to the director-general of hospitals." That is a very old and obsolete practice, which existed in the army many years ago, but it has been discontinued.

6144. What assistants have you?—I have a staff surgeon of the second class and an assistant staff surgeon.

6145. Have you any dispenser?—Yes, a dispenser.

6146. Is he a civilian?—Yes.

6147. (*President.*) How do the second-class staff surgeon and the assistant staff surgeon come to you, are they named by the director-general?—The assistant surgeon was on application.

6148. Does he remain permanently attached to you?—No, he comes by roster, and can be removed at any time.

6149. (*Mr. A. S. Stafford.*) Your dispenser is a civilian?—Yes.

6150. Is he appointed by you?—He is appointed by the Commissioners of Chelsea Hospital.

6151. Is he removed by you?—He is removed by the Commissioners of Chelsea Hospital.

6152. Do you think that the medical attendance is sufficient at Chelsea?—I think so.

6153. What are your hospital orderlies?—We have female nurses.

6154. Do you find that answer?—Admirably.

6155. Have you frequently occasion to change them?—Very seldom; we have not had occasion to change them of late.

6156. Have you no orderlies at all?—None.

6157. What pay do you give the nurses?—The first class has 2s. a day, the second class 1s. 6d., and the third class 1s. 3d. a day, with no rations.

6158. With lodging?—Yes.

6159. And firing?—Yes.

6160. (*Sir Thomas Phillips.*) And clothing?—Yes, a suit of clothes.

6161. Does your examination exercise any influence on the question of pension or no pension?—A material influence.

6162. I thought I collected from you, that you did not reject persons who came up there?—With

reference to that I may observe, that part of my instructions are these, "You are to inspect the invalid soldiers at Chelsea hospital, Chatham, or Woolwich, about to be discharged, previously to meetings of the board held by us, and to report to us in person at such boards, whether the said soldiers are, in your opinion, unfit for military service, and the cause of such unfitness."

6163. Then I misunderstood you when you gave your answer at first, that you had a veto, but did not exercise it over the question of discharge or no discharge?—I have with the principal medical officer, on one or two occasions, offered an objection, where I thought it a pity that such and such a man should be discharged, and we have in a friendly way agreed that he should be sent back to his corps; that has been done, but the instances are so very rare as to have no practical effect.

6164. With regard to whether a pension is to be given, and the scale of it, your judgment is followed?—As the medical adviser of the Chelsea Board, I explain to the Commissioners the nature of the disabilities. It rests with them to adopt or reject my view, and to award the pension.

6165. Are the limits as to the amount regulated by a positive rule of any kind?—They are regulated by Royal Warrant.

The witness withdrew.

Colonel Sir A. M. TULLOCH, K.C.B., examined.

6166. (*President.*) Do you hold the opinion that men are now granted temporary pensions and discharged from the service, who might be retained in the ranks?—I do not think that at the time they are discharged they might be retained, for then they are generally in a very unfit state; but they often recover, and become as fit for the ranks as ever. I see many such men in the course of my inspection of pensioners.

6167. You refer to men who are granted pensions for a short period, and at the end of that time are fit to return to the ranks?—Yes.

6168. Are the numbers sufficiently large to make it worth while to take the matter into consideration?—I do not think it necessary to make any different law, but if you took them back again you might gain good soldiers.

6169. Cannot you do it now?—A man must give up his pension if he succeeds in re-enlisting; besides, when the doctor came to examine him, and found that he had been in the service before, he would not take him back.

6170. What step would be necessary in order to bring such men back into the service?—That there should be no obstacle if found fit by the surgeon. There is a numerous class from the East Indies, for instance, men with bad livers and dysentery, who, recovering in a short time, become fit for service, and being still young, might be re-enlisted with advantage.

6171. At present a man must serve 21 years, which generally produces some disability, to get his discharge?—Yes, that is the practice.

6172. A few are given modified pensions?—Yes, but they lose 2d. a day; they get 10d. instead of 1s.

6173. All that will be cleared away when the short service warrant comes into full operation?—Yes, in 11 years hence it will be entirely cleared away.

6174. Have you paid a great deal of attention to the subject of the ration?—Yes, I have.

6175. You recommended, did you not, in the Crimean report, a fixed rate of stoppage with a fixed ration?—Most decidedly. Experience in the Crimea showed that it was absolutely necessary that men in the field should be entirely supported in order to be certain of having everything they required.

6176. The system of a partial supply by the commissariat, and a partial supply by the men, entirely failed in the field?—Yes.

6177. You proposed a ration?—Yes, similar to that which was then issued in the Crimea, with the substitution of suet pudding, or with raisins in addition for a portion of pork, or of bread; either would have pretty nearly the same effect, and it would give greater variety. The cost of the proposed additions would not probably exceed 2½d. The ration that a soldier is entitled to, under other circumstances, not in the field, would have been 1 lb. of bread and 1 lb. of meat for 3½d.

6178. Did you add to the bread but not to the meat, or to both the bread and meat in the field?—The meat still remained 1 lb.; it was the bread that was raised to 1½ lb.

6179. Why did you not add to the meat?—Because we conceived 1 lb. of meat as much as is necessary.

6180. A pound of foreign meat?—Yes.

6181. That is only equivalent to about ¾ lb. of English meat?—Yes; but I conceive that that is quite as much as this class of men has ever been accustomed to have even at hard labour in this country, and it is as much or more than the soldier will have when he leaves the army. I think it a serious matter to accustom him to a very expensive description of food. I should like to see him have more flour in the shape of bread or pudding; but I question the expediency of giving meat.

6182. You submitted that ration afterwards to Dr. Christison, did you not?—It was submitted to him by Sir John McNeill, and he thought it a good and sufficient ration.

6183. He considered it to be sufficiently balanced between the two kinds of nutriment essential to keep a man in health?—Yes.

6184. (*Mr. J. R. Martin.*) Though the men were subjected to the hard labour of the camp?—Yes; he conceived it a fair diet.

6185. (*President.*) Do you think it would be an advantage to pursue the same system in peace, and give a man a whole ration, and make one stoppage, thereby getting rid of all the complicated accounts for stoppages?—I should be very glad to see this done in time of peace, if it did not add to expense in

*Dr.
MacLachlan.*

*Colonel Sir
A. M. Tulloch,
K.C.B.*

Colonel Sir
A. M. Tulloch,
K.C.B.

24 June 1857.

the issue, or make a larger commissariat establishment necessary.

6186. It was stated by Mr. Adams that this could be done for an increase of expense hardly worth considering?—I know that there is very great difficulty sometimes in the colonies in rationing 100 or 200 men at remote stations, and the result is that you sometimes pay as much for the commissariat establishment as a fourth part of the value of the ration.

6187. Would not the person who contracted with the commissariat do the same as he does now when he contracts with a detachment?—The commissariat officer might not always be able to get a person to contract with him.

6188. If a regiment could get supplied, the commissariat could get supplied?—Yes, there would be very nearly the same difficulties, but though there might not be a person on the spot disposed to undertake the supply of a regiment or of the troops altogether, these might, by going to different shops, be able to get a supply for themselves.

6189. The worst thing that could happen would be that you would have the same difficulties as now?—Yes.

6190. Of what do you propose that the ration should consist?—"Soft bread, 24 oz.; fresh vegetables, 8 oz.; rice or barley, 2 oz.; fresh meat, 16 oz.; coffee (roasted and ground), 1 oz.; sugar, 2 oz.; spirits, $\frac{1}{8}$ of a pint daily; with mustard, $\frac{1}{2}$ oz.; pepper, $\frac{1}{4}$ oz.; salt, $\frac{1}{2}$ oz. weekly." The spirits was a ration peculiar to the field, it would not be issued anywhere else.

6191. Would you add anything more, such as pudding?—6 or 8 oz. might be given in the shape of pudding instead of bread.

6192. I think the men here consume $1\frac{1}{2}$ lbs. of bread?—The reason they have the $\frac{1}{2}$ lb. extra is that they consume much bread with their dinner. If they had plain pudding it would be a variety, and they would not require this bread.

6193. Could you apply the same stoppage on board ship?—Yes; I think it could be applied very well.

6194. And in hospital?—Yes; but it might be a question whether you should not take a little more from a man, say 4d. every day that he is in hospital.

6195. In war a soldier would lose in hospital, as at present he has no stoppage except the commissariat stoppage in hospital?—I think it is better that he should be subject to a good stoppage in hospital, for I am afraid that the balance that comes to him is not always, either in the field or elsewhere, expended in the way best suited to his health.

6196. At the time when the arrangement was made, that the soldier should only pay for his commissariat ration when in hospital, he was not supplied with many things which are now granted to him there?—I understand that you are going to supply him with clothing and washing and everything of that kind.

6197. Under the new regulation his necessities will not be subject to any wear and tear?—Yes, and that will save him on the average 2d. a day.

6198. (Sir H. K. Storks.) He has no right to complain?—No.

6199. (President.) What account keeping would be saved by doing away with the stoppage, and giving a man a net pay?—There would be no accounts of any consequence.

6200. Is the stoppage account a complicated one?—Yes, at present it is.

6201. You have stated that it is a very operose and difficult matter?—Exceedingly so; the gentlemen in every department to whom I have spoken declare that it is almost impossible in war, and especially when situated as in the Crimea, to make up the accounts.

6202. Then, again, in the examination of the accounts, of course all those stoppages must be checked and gone over again?—Yes.

6203. (Mr. J. R. Martin.) Do you, at the same time, believe that a just audit is next to impossible?

Yes, the difficulty was declared to be so great as to render it almost impossible to audit the accounts.

6204. Should not soft bread be issued to the men whenever it is possible to attain so desirable an object?—I conceive that to be of the very utmost importance.

6205. That should be the rule, in fact, and biscuit the exception?—Certainly.

6206. Wherever it was possible to supply it?—Yes. Even on board emigrant ships arrangements are made to issue soft bread; in fact, wherever you have a body of men upon a diet which might perhaps under other circumstances produce scurvy, endeavours are usually made to give them soft bread.

6207. Would it not be desirable, in peace, that so many men per company should be taught the art of baking?—I think that would be one of the greatest improvements—always keeping in view that when you are in the field you must not reckon upon those men to go into the trenches, or as combatants.

6208. Not all of them?—No; it would also be of the greatest benefit to the men to teach them baking, because when you discharged them they could find employment immediately as bakers.

6209. (President.) You ought therefore to have a baking establishment at home?—I think so, and also abroad.

6210. (Mr. J. R. Martin.) Would it not be very desirable that a couple of men per company should be instructed in well-digging?—That would be an improvement, there is no doubt, wherever water is likely to be required, or wherever you wanted to know something of the sub-soil.

6211. At present for such a desirable object you would have to go out of the regiment for artificers?—I think that some of the soldiers could dig down sufficiently; I am not aware how far they might require to go; but unless they had to go down below 24 or 25 feet, it might be done by them.

6212. Such instruction would not involve much trouble or expense?—No.

6213. (Sir Thomas Phillips.) Do you think that in certain climates the diet should be at all varied?—I think it is of the greatest importance that the soldier's diet should be varied as much as practicable. I am sorry to say that it is not so, with the exception of the East Indies, where there is a very considerable variety, because provisions are cheap, and the soldiers have the means of employing servants to cook for them; a soldier in India certainly enjoys very great advantages in this respect.

6214. The adaptation of food to climate is very conducive to health?—Yes, there is no question of it.

6215. (Mr. J. R. Martin.) The European soldier is more comfortably circumstanced in India than in any country with which you are acquainted?—Yes, as to diet; but it is owing not to any larger pay, but because the necessities of life are so reasonable, and wages so low.

6216. (President.) In laying down any general ration, there should not only be an occasional change of the article consumed, but also in the manner of preparing it?—Yes.

6217. And then again, equivalent rations in point of value should be given in different climates according to the productions of the country?—Yes, so far as practicable, but a great deal must be left to the general officer commanding.

6218. (Sir H. K. Storks.) The general officer might form a board, including a commissariat officer and a medical officer, to decide what the ration should be?—Yes, and what the equivalents.

6219. (Mr. J. R. Martin.) Or else a diet suited to the various climates might be included in a manual of sanitary science, such as every medical officer ought to have in his possession?—Yes; after you have fixed it and found it to be the best.

6220. (President.) I believe you have drawn out a model dietary?—I have prepared one calculated to

Colonel Sir
A. M. Tulloch,
K.C.B.

24 June 1857.

afford greater variety than at present, and which might be applied for so many days in succession. You are aware that a soldier has only the same description of diet from the day he enters the service till he leaves it. That diet consists of good materials; but I am sorry to say they are always cooked in the same way, there is no change whatever. My object is to show how the different items might be so arranged as to give greater variety without any additional expense.

On the first day I would give the soldier an Irish stew, with onions and potatoes and rice pudding; there is no difficulty in that.

6221. Irish stew is what they have now, is it not?—Not exactly; it is something between a stew and a boil.

6222. (*Sir H. K. Storks.*) How would they make the rice pudding?—With a little milk, sugar, rice, and eggs; if you cannot get eggs you may put a small portion of preserved potato to lighten the pudding.

6223. Would the commissariat supply those articles?—They would supply the rice, sugar, and preserved potatoes or eggs; but I see some difficulties as to small items which the commissariat could not supply, these the men might purchase for themselves.

6224. (*President.*) That does not apply to flour, which the commissariat could supply?—No.

On the second day I would suggest boiled salt or cured pork, with pease-soup and potatoes mashed with greens or cabbage; called colcannon in Ireland. I think it would be an advantage to the soldier to have salt provisions one day in the week; he would thus get accustomed to the use of it on service, and learn how to soak and prepare it.

6225. (*Sir H. K. Storks.*) That is to say, the cooks would?—Yes. The third day I would give roast or baked meat, with potatoes and Yorkshire pudding, —the Yorkshire pudding being exactly of the description prepared for the boys at Chelsea asylum.

6226. Where would they get the eggs and milk from?—The pudding used at Chelsea is very good without eggs; and, as I said before, the milk they could get anywhere. I am supposing them to be in garrison or at home.

6227. Is the commissariat to supply it, or is the soldier to supply it himself?—I speak with reference to the ration found by the commissariat,—the milk and eggs I think the soldier might supply himself.

6228. Where are you to get the money for that?—If you go into the expense of this diet you will find that it does not exceed $8\frac{1}{2}d.$ a day including washing. (*See Appendix No. XXXI.*)

6229. How will you arrange with the commissariat about paying for it?—Provided the cost of this diet does not exceed $8d.$, with $\frac{1}{2}d.$ for washing, you are entitled by the regulations to mess a man up to that amount. If the commissariat supplied the major part or $\frac{9}{10}$ ths of it, a halfpenny might be applied by the soldier in getting such things as milk, which the commissariat might have a difficulty in issuing; a soldier must have milk in his tea.

6230. But then you come back to the soldier supplying part of his things?—Yes, when not in the field. On the fourth day I would give boiled beef, with soup and vegetables thickened with rice, pearl barley, or sago, also boiled potatoes. Then on the fifth day I would give roast or baked beef, with potatoes under, and plum pudding of the same description as sailors have. On the sixth day I would give boiled mutton with soup and vegetables, and boiled potatoes; it is merely a change from beef to mutton. Then on the seventh day I would give stewed beef with vegetables and potatoes, I think these are all changes which might be quite practicable. (*See Appendix No. XXX.*)

6231. The only difficulty that I see is in the two cases where the eggs and milk are to be supplied?—You cannot supply milk; there must be always some things to purchase. I question whether you can supply fresh vegetables, but you have the resource of the preserved vegetables and the preserved potato, which are valuable alternatives.

6232. But preserved vegetables and the preserved potato are not equal to fresh?—I am not aware that there is much difference; I have used them repeatedly.

6233. A commissariat officer who has been examined stated that he saw no difficulty with regard to vegetables?—In the only case in which they tried to supply them in the Crimea, there was great loss.

6234. But that was under very peculiar circumstances, it was not their habitual duty; but if you made it their duty it would become very much easier?—I know that it would be very difficult to get good potatoes just now.

6235. (*Mr. J. R. Martin.*) If it became once the rule would it not become the business habit of the commissariat department, as it was in India?—I hope it would, but in India they do not supply vegetables.

6236. (*Sir Thomas Phillips.*) What you have suggested is intended to apply to home and to garrisons?—Merely to home and to garrisons, but there are many garrisons where they might have even something better.

6237. Do you contemplate the food being issued to the soldiers cooked?—Yes; there are two ways in which it might be issued; either let the soldier cut off whatever he requires, or if his discretion could not be trusted sufficiently for that, let the meat, after being cooked, be divided as equally as possible under the supervision of a non-commissioned officer.

6238. You contemplate the ration being delivered to the soldier in a state fit to be eaten?—Yes.

6239. (*President.*) When you speak of baked or roast meat, you do not mean that the rations should be cut up raw, but that there should be a joint from which the soldier might cut his dinner?—Yes, or that it should be cut for him. I see no impracticability, under proper arrangements, in a soldier sitting down to joints, as the sergeants do.

6240. (*Sir H. K. Storks.*) If all the six companies are to dine on roast beef, there are some portions of the animal which are served out, and which are not roastable?—To meet this objection I propose that the companies should begin on different days; one company starting with one description, and another with another description of diet, so that you would not have them all boiling and roasting on the same day. If to this you were disposed to add an eighth variety so as to correspond with the eight companies in a battalion, there might be soup made of the head, shanks, and feet of animals, not otherwise issuable; also roast heart, fried liver, and tripe, which are not at present made available, with suet or plum pudding. I am sorry to find, that on service all these parts, constituting about one-fifth of the animal, are lost.

6241. (*Sir Thomas Phillips.*) With regard to spirits, in your first statement you said that you would only issue them in the field?—Yes, or when they were necessary. Officers commanding have power now to issue spirits when they are wanted.

6242. Do you include beer in the ration?—No.

6243. Do you propose that the soldier should be supplied with beer?—I am much disposed to say that he should have his beer, for I have often found that he spends the money intended for beer on whiskey, but this arrangement involves the objection of forcing a saving man to expend money in beer.

6244. Do you not think it necessary for the health of the soldier that he should be supplied with beer?—I think he will be much better with it.

6245. As far as the public service is concerned, it would be desirable that the ration should include beer?—There are objections to it, for instance, beer is sometimes difficult to keep.

6246. (*Sir H. K. Storks.*) And difficult to carry?—Yes, I think however, that one of the great faults we commit is the laying down such an inexorable rule, that wherever there is a difficulty in one instance it is supposed to exist in another; take for instance Gibraltar, why should not the men have beer there? it is a seaport, and it could be carried easily; but if you proposed to issue beer in the eastern

Colonel Sir
A. M. Tulloch,
K.C.B.

24 June 1857.

provinces of the Cape of Good Hope, it would be a very difficult matter.

6247. (*Mr. J. R. Martin.*) In India you are aware that beer is issued to the men?—Yes; but it is not a commissariat issue—not as a ration.

6248. (*Sir Thomas Phillips.*) I understand you to lay down as a rule of a very important character that everything necessary for the health of the soldier should be supplied to him by the government?—Yes, in the field, I certainly think so.

6249. Why not at home?—The only objection is, that I am afraid it might involve considerable expense, and an additional commissariat establishment, where the soldier could just as easily purchase for himself; if that is not so, I see no reason against it.

6250. Suppose you had the means of determining, by what mode the health of soldiers could best be preserved, would you supply them with everything necessary for that purpose?—Yes.

6251. As part of that supply, do you regard beer as necessary?—Yes, in this country I think it is.

6252. And in climates where beer could be provided?—Yes; but at the same time there is a difficulty as to making a soldier drink beer who would probably prefer saving money for his family. I know also that many commanding officers do not like to see beer going about the barracks; if they go in and find half a dozen tankards, the men would allege as an excuse, that it was the ration beer.

6253. (*Sir H. K. Storks.*) Would you supply the soldier gratuitously with beer?—No, I would charge him a penny for it. I would not lay it down as a positive rule, that every man should be obliged to take and pay for it; but certainly, if a man gets a penny a day to be spent in beer, it is better spent in beer than in spirits.

6254. (*President.*) Do you think that you could make an alteration in the ration so as to exclude articles which cannot be supplied generally by the commissariat?—No; if that was the case I should require to exclude the puddings and the milk for tea, and the milk for coffee also; I propose to keep up the breakfast and supper meal as at present.

6255. (*Dr. A. Smith.*) Why should there be a difficulty in supplying milk and eggs by the commissariat; we have no difficulty in supplying them to the regimental hospitals, which would be about the quantity required for a regiment?—Yes; but a regiment would be ten times the number, and there might be ten times the difficulty.

6256. There are certain stations where regiments are quartered, where, if generally known to be wanted, there would be a regular supply of milk and eggs; persons would volunteer to supply them?—Yes, perhaps so, but I think you might easily leave the milk and eggs to be purchased by the men or their non-commissioned officers.

6257. Milk would not be very difficult to supply by the commissariat, would it?—In warm weather it is very apt to turn, and a person who took a contract would require to keep a great quantity in hand.

6258. But the number of men to be supplied would be always the same?—One company might get it from one person, and another company from another; but very many of these difficulties which I have mentioned will vanish when the thing is tried fairly, or you would find out what is likely to do better.

6259. (*President.*) There is no difficulty in supplying a hospital where the patients vary every day with milk?—There is not.

6260. (*Mr. T. Alexander.*) Do you approve of the spirit ration on board ship?—I think in some cases the spirit ration, provided it is well watered and mixed with a quantity of sugar and lime juice, is a very good thing, and for this reason, that the water is very often undrinkable, and sometimes unhealthy.

6261. But the quantity that he takes with his liquor does not supply a man with the amount of water that he drinks every day?—No, but it assists him;

three waters would give him half a pint; which is about as much as a man drinks in a day.

6262. Might not the young soldiers be apt to acquire a taste for liquor?—It would be a very bad practice if they got it raw, as I have seen them drink it frequently.

6263. Would not beer be better?—Yes, in point of health.

6264. (*Mr. J. R. Martin.*) Do you not think, with regard to young soldiers, that when once they arrive in a hot climate, during the first 6 months the spirit ration should be withheld from them, and beer substituted?—Yes; the objection I have to rum is, the issuing of it raw; but if made up into weak punch it is very good indeed; the rum is generally of excellent quality on shipboard.

6265. (*Mr. T. Alexander.*) The rule is to issue it on board ship?—Yes.

6266. (*Sir James Clark.*) Is there any difficulty in mixing it in the army?—I do not see that there would be any difficulty, only sometimes they can get beer or wine, which are preferable.

6267. Does beer often get spoiled in hot climates?—Yes; but if it were made strong it would not. I do not think that much of the beer sent out to the East Indies spoils.

6268. It has been reported that the preserved vegetables have not been so effectual in preventing scurvy as vegetables in a natural state?—I have no information on that subject. It is specially laid down by the persons who sell these vegetables that they are antiscorbutic, and possessed of all the qualities of raw vegetables; if that be not the case all contracts for them would be void.

6269. Are you of opinion that a great deal of the animals slaughtered is lost to the army?—Yes, and at a time when probably fresh meat would be very valuable.

6270. (*President.*) At Balaklava did not the sailors buy the heads of the animals and make soup of them?—Yes.

6271. And the French?—Yes, and they made very good soup. In one of our regiments, where there was a Frenchman, he got all the feet of the animals and made excellent jelly, and also cow heel, and dishes of that kind, which he sold at great advantage to himself.

6272. Have you any means of knowing whether meat can be corned or slightly salted so as to last for four months or six and be perfectly safe for the use of an army, being sufficiently preserved, and yet much less deleterious to them than the present navy meat, which is salted for distant stations?—I am doubtful whether you could salt it for four months without a complete change; I think you might do it for a month.

6273. But a month would be a great risk, would it not?—It must be consumed immediately. When the troops were in the Crimea slaughtered fresh meat was sent without being salted at all.

6274. Did it arrive in a state fit to eat?—Yes, and it was issued; but if it had had a little salt rubbed into it, it might have been kept for two or three weeks.

6275. In the way in which meat is prepared for the Australian emigrant ships?—That method might be adopted, but I doubt whether it would last for four months.

6276. (*Mr. T. Alexander.*) Have you seen the meat in the tin cases?—Yes, and have used it very extensively from the first.

6277. (*President.*) Would it be safe to obtain preserved meats of that kind from contractors, or should the government manufacture for themselves?—I think it would be much better for some one on the part of government to see it manufactured. There would be no difficulty in doing this; for when the system of issuing preserved meat was first brought into operation, Earl Grey was in office, and as he was very much interested in bringing about a reduction in the issue of salt meat in the West Indies, I at his request attended for three or four weeks at the place where

the meat was being cured, to see 30,000lbs. or 40,000 lbs. prepared before being sent out. I saw that it was of good quality.

6278. Since that period, which was about the year 1836, a very great change has been made in the diet of the soldiers in the colonies?—Yes.

6279. On how many days a week was salt meat issued there?—Five days in a week at most stations in the West Indies.

6280. What has it been diminished to now?—To two days.

6281. You have been engaged for a very long time with Dr. Balfour in compiling statistics of the army?—Yes.

6282. What has been the degree of mortality among British soldiers within the United Kingdom, and in all our foreign possessions?—There are two periods that I may notice in illustration of this question, one is contained in the four volumes which we presented to Parliament, showing the results from 1817 to 1837; the other after 1837, when many important changes were made in the condition of the troops.

6283. That is, changes as to diet, and also the removal of the barracks to higher regions in hot climates?—Yes, and there has been also some improvement as to the space allowed in the barracks. I have made out a rough statement of the mortality for the 16 years succeeding to 1837.

6284. What is the rough result?—From 1817 to 1838 the mortality in the West Indies was $78\frac{1}{2}$ per 1000 by diseases treated in hospital. Many men also died by diseases which did not come under treatment, raising the loss very nearly to 85 per 1,000, whereas the mortality, taking the period from 1838 to 1853, has been 60 per 1,000, that is to say, a reduction of very nearly 25 per 1,000 or $2\frac{1}{2}$ per cent. has taken place. In Jamaica where there have been important changes, especially by the troops being removed to the high grounds, the mortality by disease alone, taken upon an average of 20 years, was formerly 121 per 1,000, and including diseases which terminated fatally out of hospital, it was 130 per 1,000, but in the last 17 years which I have gone over, the mortality has been reduced to 58 per 1,000.

6285. (*President.*) Within those 17 years, has the difference been very marked in favour of the last years?—It is considerably in favour of the last years, but it has varied in this respect.

6286. Will your return show that annually?—Yes; when it is completed and published for Parliament. I now pass to Ceylon. In that colony there has been very little alteration of diet, for, as in the East Indies, the men are generally well dieted, owing to the cheapness of provisions; there has been, however, considerable improvement, by placing the troops in more healthy localities, and the result is that the mortality which on a period of 20 years from 1817 to 1838, was nearly 70 per 1,000, by disease alone; has from 1838 to 1856 been reduced to 36 per 1,000, or very nearly one-half.

6287. (*Sir H. K. Storks.*) Does that return include the white troops?—It is the white troops only who are referred to; they are separated from the black.

6288. Then the Ceylon rifles are not included?—No; but the mortality in the West India regiments shows that improvement has extended to the black troops as well as to the white. Taking an average of 20 years, the mortality of the black troops in the West Indies was 40 per 1,000 or 4 per cent., but taken upon the last 17 years, it is 30 per 1,000, though there has been no change by removing them to higher grounds.

6289. (*Sir Thomas Phillips.*) What has been the improvement in their case?—From 40 to 30, they are not so crowded as they were before.

6290. These are simply the deaths in hospital?—Yes, merely the deaths in hospital.

6291. (*Sir H. K. Storks.*) Has the improvement resulted from improved diet?—Yes; and they have

also much more space than they had before in the barracks.

6292. Are the stations also improved for the black troops?—Yes; some very unhealthy stations have been improved.

6293. Some of the bad stations have been given up, such as Fort Augusta, and Montego Bay?—These have been given up for white troops, and also some of the worst stations for black troops.

6294. (*Sir Thomas Phillips.*) Do you know whether the general health of the island of Jamaica is improved?—In Jamaica the black troops, on the average of the 20 years antecedent to 1837, lost about 30 per thousand annually; this loss has been reduced to 27 per thousand since 1837.

6295. You cannot tell whether, with regard to European or black population, the general health of the island is improved?—Decidedly it has not, as to the blacks, for I know that the negro population has fallen off nearly one-third within the last 40 years.

6296. (*Sir H. K. Storks.*) But that has been more on account of emancipation, has it not, than any other cause; take the island of Mauritius, the black race have nearly disappeared?—And for a very good reason. If our black soldiers die at the rate of from 40 to 30 per 1,000, at the very best period of life, it is quite clear that no population can last at that rate. In the United Kingdom the population is kept up very well, because the prime only die at the rate of, perhaps, 11 or 12 per 1,000.

6297. But the mortality among the negro population in the slave islands where they have been emancipated arises from their idle and dissolute habits, there being no control over them; when they were slaves they could not get drunk?—Yes, partly; but it must also be kept in mind that the West Indies is not the climate nature intended for them, and the mortality will go on till, in fact, that race becomes extinct there.

6298. (*Mr. J. R. Martin.*) At that rate of mortality it is impossible the people can increase?—It is quite impossible; no such thing can be; where you find the prime of the population between 20 and 40 years of age, losing 30 or 40 per 1,000 annually, the population must decrease. To go on with my comparison. In the Mauritius, taking an average from 1817 to 1838, the loss was 27 per 1,000 of white troops, but upon an average of the last 17 years it has been only 23 per 1,000. The reduction is equally perceptible in most of the colonies, take Saint Helena for example; there the mortality, for a period of about 8 years, during the time of Napoleon's residence, when the men were fed almost exclusively on salt meat, was $25\frac{4}{10}$ per 1,000, but within the last 17 years it has only been 11 per 1,000. In the former period there was over-crowding, but the men occupy the same barracks now as then.

6299. (*Sir Thomas Phillips.*) So far as you can judge you regard, as the causes of the improvement, the altered diet, and the absence of over-crowding?—Improved diet, and absence of over-crowding, and the removal of the troops to the high grounds, and in the West Indies the shorter period of service, those are four important changes that have taken place.

6300. (*Mr. J. R. Martin.*) Have you during many years been in the habit of investigating the causes of sickness and mortality amongst soldiers within the United Kingdom, and in our foreign possessions?—Yes, I have.

6301. Have you, during those years, been much occupied in investigating matters relating to the health and comfort of the British soldier?—Yes; it has been my duty to bring under the notice of the secretary-at-war anything likely to improve them.

6302. During that period, what has been the range of your observation as to the number of men?—My range of observation has extended over 100,000 men, I should say for 40 years, making four millions of observations.

6303. No other person in this country except Dr. Farr, of the registrar-general's office, has enjoyed the advantage of so great a range of observations?—I believe not.

Colonel Sir
A. M. Tulloch,
K.C.B.

24 June 1857.

Colonel Sir
A. M. Tulloch,
K.C.B.

24 June 1857.

6304. Does it accord with your observations, that everywhere, and more particularly in tropical climates, we must regard the want of healthy localities for camp stations and cantonments, the absence of proper structural arrangements in barracks and hospitals, the inattention to suitable feeding and clothing, and promoting better habits of life, the absence of instruction in cooking, hutting, exercising, and bathing; the neglect of change of air and of climate in the remote stages of disease, as the efficient causes of the constant and great losses of the British army?—No doubt all those causes have, so far as my experience goes, added materially to the mortality.

6305. Have you had an opportunity of considering, in a general way, what might have been the loss in the European forces in India since 1815, when your records on the subject commence; and if so, will you be good enough to state it?—I have gone into the matter roughly, by taking the strength in each year, and the deaths, for the last 42 years, and find that the deaths have amounted to nearly 100,000 of Her Majesty's and the East India Company's European forces out there, including officers; but it is for a very long period.

6306. Is it your belief that the greater part of this loss might have been averted had better sanitary arrangements been practicable, such as keeping the troops at the healthiest, instead of unhealthy stations?—There can be no question, provided all the troops could have been kept at the healthy stations, that much of this loss might have been avoided—but that involves political considerations.—Considering, however, the changes they are now making in India, by which railways will shortly facilitate the movement of troops, it may be a very important question whether a great portion of the men might be kept on the high grounds, where the mortality does not much exceed that of England.

6307. Would not such sanitary measures involve a saving of many millions sterling in money?—There is no question of it, for every soldier who goes out costs at least 50*l*.

6308. Are you aware that the late Dr. Burke, Inspector-general of hospitals in Bengal, stated that the cost to the State on account of the loss of European soldiers at Secunderabad alone, was the sum of 150,000*l*., in 30 years?—I dare say that it was much more, for Secunderabad is one of the stations that was exceedingly unhealthy; I think that the mortality for several years ran as high as 11 per cent., and in one year 13 per cent., but I believe it is altered now, and that the station is healthy, all those barracks having, after a long discussion, been removed.

6309. Do you think that the evil from this state of things could have held for so long a time, had the medical department of the two armies serving in India been well ordered, well regarded by the State, and consequently well contented with their condition?—I have no doubt that they made repeated representations, in fact I have seen a great many about the state of those barracks, but there may have been a great political question as to whether the troops could be moved from them or not, I know that the medical officers did make representations, but perhaps they might not have had the weight which they were entitled to.

6310. Looking to the health and history of British soldiers, and to the causes which have everywhere operated to injure their health, what do you expect would be the benefit from having an officer of health to supervise and inspect the sanitary arrangements of the army?—It would depend upon the power which that officer had, and the position which he held; of course, if he was very high in office, any recommendation that he made, if he were of repute, would have great weight. There can be no question, that an officer appointed specially to look after the health of the whole army (supposing the head of the medical board too much occupied to take up that subject in a minute way) would be attended with a

very good effect. Such a person, however, must obviously be an officer of military as well as medical experience, otherwise he might be led to recommend measures incompatible with discipline and the usages of the service.

6311. If, in peace time, such an officer were to examine and report on the proper sites, and on the sanitary condition of camps, temporary military stations, and cantonments on convalescent stations and sanatoria; on the structure and arrangement of barracks and hospitals, and on everything affecting the health and comfort of the soldier, would there not be much advantage?—I think it would be very useful indeed. There is no doubt that it would secure better attention to all those points, than has been given to them, but there are several matters connected with the position of a barrack, which depend upon circumstances. Take Gibraltar, for instance, you cannot alter the fortifications; you make the most of them in building the barracks, but in many cases, the ventilation is difficult to be secured.

6312. There you could simply improve it?—Yes, Corfu, and Malta, and Halifax, are also places where you would have very little opportunity of improvement, but in the East Indies, Ceylon, and the West Indies a great deal might be done.

6313. In time of war such an officer might be attached to the Quartermaster-general's department, and be always in advance with that officer, so as to be well acquainted with the topography of the scene of action; do you think that his position there would be of advantage to the service?—Of course it would, provided he could say whether a particular position would be healthy; there is an impression that too little attention is paid usually to medical experience in selecting sites for camps.

6314. If our Commanders in the East and West Indies had had the advantage of the opinion and the advice of an officer so endowed, do you think that the enormous mortality among the soldiers in those possessions might not have been diminished?—I think if there had been such an officer in those commands, he would when the war terminated in 1815, have probably brought under the consideration of the government, that it was no longer necessary to keep the troops in these unhealthy positions close to the sea.

6315. In Jamaica where, for so many generations, the mortality of the European soldiers was at the rate of 130 per 1,000 per annum, do you think if such an officer had been there, the troops would have remained so long in the pestilential plains as they were allowed to do?—I think that if any superior medical officer had specially directed attention to the advantage of moving the men to the high ground, it could easily have been shown that as there was only a loss of 2 per cent. at Maroon Town it would be an advantage to remove men there from the low grounds; but the state of the slave population at the time may have influenced the question.

6316. If such an officer had been at head quarters in London in 1809, would not some effective warning respecting the climate of Walcheren have been imparted to the government of the day so as to have diminished the evils that occurred there?—I believe there was some warning given to them, only that they did not attend to it. Napoleon, knowing the sickly nature of the climate, so soon as he heard that the English had gone there, expressed a hope that they would remain.

6317. Had a superior officer of health accompanied the expedition to Rangoon in the first Burmese war, would not some effort have been made to prevent the almost total destruction of European soldiers by scurvy?—If he had been a man of weight and power; and could have said to Sir Archibald Campbell, 'You must send round vessels to get fresh provisions and vegetables,' something might have been done.

6318. And also in China?—Fresh provisions could, I believe, have been procured there, and it must have occurred to every one that they should have been used in preference to salt meat in that climate.

6319. Had such an officer been employed with the forces recently in Bulgaria, would not more care have been observed in selecting better sites for encampments?—I have not been in Bulgaria, and therefore I could not say whether the troops were in those localities which at first sight would strike a person as unhealthy; but from the experience that an officer of health would acquire, he would be no doubt much more competent to judge what localities should be avoided.

6320. Have you formed any opinion upon the responsibility which ought to attach to the unnecessary sacrifice of health and life by military commanders, and do you not think that some grave responsibility ought to attach to such sacrifices?—I think it ought, but I am afraid it does not always happen that, when you gain victories or produce great effects, you look to the cost very much.

6321. Are there any circumstances within your recollection apart from the field of actual military operation under which a commander could be warranted in sacrificing the health and the lives of his men?—He might be in an unhealthy position, and it might be absolutely necessary on account of his operations to remain.

6322. Would not that very unhealthiness which might destroy one third of his men, and place the rest of them frequently under treatment in hospital, nullify the post as a military station?—It is entirely a matter of calculation; even Marlborough once sacrificed a very considerable post for the purpose of producing a desired result in his operations.

6323. (*Dr. A. Smith.*) From your experience in the service, and from all the opportunities you have had of ascertaining what medical officers have done by reference to the documents in the director-general's office, do not you consider that almost every officer, particularly of any standing, in the medical department of the army is actually to a very great extent a sanitary officer, and constantly does give attention to those subjects?—In a degree he may be, but I question whether, as yet, our army has made that progress in sanitary arrangements which might have been expected, considering the ample field of observation presented by our colonies.

6324. The medical officers might have made representations continually as to the necessity for improve-

ment in sanitary measures, and the necessity for removing the troops to higher grounds, but those recommendations were in no way attended to?—With regard to the improvement of barracks and hospitals, I know that many were not attended to. As to the removal to higher grounds, I do not think that so much attention was paid to that subject in the medical reports as there might have been, otherwise this change would have been carried into effect.

6325. From Jamaica there were numerous reports sent to the government, advising that a higher situation should be selected, if it could be found?—At what period?

6326. During the last 20 years?—It was in 1837, nearly 20 years ago, that the government commenced extra buildings at Maroon Town, and in 1843 at Newcastle.

6327. (*Mr. J. R. Martin.*) Does not the circumstance of this inattention to the medical reports show the necessity of having some other arrangement with a view to these great sanitary matters than the old one?—With regard to inattention shown to medical reports, I can only speak at this moment specially with regard to barracks and hospitals; I know that their condition was repeatedly represented by the medical officers, and when it became my duty to collect information as to the West Indies, and submit it to Lord Grey in a report, I called his attention to the repeated complaints that had been made, and in some instances I showed him the original reports; he was satisfied that the officers had been repeatedly representing it, but that the Ordnance Department would not incur the expense of erecting new buildings.

6328. In fact the medical officers always performed their duties well, the fault was that their reports were not attended to?—I presume so; I recollect that their representations were very numerous, but ineffectual, principally in consequence of the expense that would have to be incurred.

6329. Are you aware that the recommendation for the removal of the European troops from the plains to the mountains in Jamaica was made so far back as 1791 by Dr. Robert Jackson?—I am aware that he called attention to the subject at that time, but he had not the same experience then that we have now of the relative mortality at these places, as compared with the low grounds.

The witness withdrew.

Adjourned to Monday next at One o'clock.

Monday, 29th June 1857.

PRESENT :

The Right Hon. SIDNEY HERBERT, M.P.
Dr. ANDREW SMITH.
T. ALEXANDER, Esq., C.B.

J. R. MARTIN, Esq.
Dr. JOHN SUTHERLAND.

PRESIDENT, The Right Honourable SIDNEY HERBERT, M.P.

Mr. BERRINGTON attended before the Commissioners, and produced his newly invented Knapsack.

Colonel Sir A. M. TULLOCH, K.C.B., further examined.

6330. (*President.*) Will you state what was the origin of the formation of the statistics of disease and mortality in the army?—It arose in this way. I happened to be employed on the Recruiting Service in 1834, when 10,000 men were to be reduced in the army, and it occurred to me that it would be well worth considering, whether it would not be better, as a financial measure, to give every man, after ten years' service, his free discharge, than to reduce the army by gradually

allowing the numbers to drop off by casualties. To ascertain this it was necessary to calculate the value of the pensions at different ages, and the prospective chances of soldiers attaining those ages; this again involved an inquiry as to what was the mortality in the army. I found very few indeed who could give me any information on that point, but my endeavours to obtain it made me acquainted with Mr. Henry Marshall, the deputy-inspector of hospitals in Edin-

burgh, from whom I obtained numerous facts which he had been collecting on the subject. I had also collected privately in the East Indies the loss that had occurred in every regiment. Having ultimately thrown together all the information thus obtained, I made calculations which were submitted to the Horse Guards, as to the advantages of facilitating free discharges under the circumstances above referred to. I also drew up a statement for publication through the United Service Magazine, with which I was then in communication, showing the important purposes to which information regarding the mortality in the army might be applied and I gave a summary of that information so far as I had been able to obtain it. From the Army list, in which the death of every officer is recorded and the place where it occurred, I subsequently made up a statement of the loss among that class, and compared it with the loss among the men, so as to get a tolerably fair average of the effect of each climate upon both. At that time Earl Grey had his attention directed to the loss among the troops in the West Indies, and having learnt my endeavours to procure information on the same subject, he proposed my being employed to draw up, from the records of the Medical Department and the War Office, a report for him in the first instance, and, ultimately, for Parliament. The introduction to that report gives the following explanation of the circumstances in which it originated: "In October 1835 the secretary-at-war deemed it requisite that an inquiry should be instituted into the extent and causes of the sickness and mortality among the troops in the West Indies, with the view of founding thereon such measures as might appear likely to diminish the great loss of life annually experienced in these colonies. At this period there existed no public document which could at once supply that information for a series of years, and though the number might have been ascertained by a compilation from the War Office returns, that fact, unaccompanied by a detail of the diseases, as well as the extent of sickness which prevailed, would have afforded a very inadequate idea of the magnitude of the evil or the causes by which it was induced. Under these circumstances it became necessary to refer to a very voluminous series of returns and reports, containing an historical record of the medical transactions in the British army since 1816, when first established by Sir James McGrigor, the Director-general; but these documents extended over upwards of 160 folio volumes, and had been accumulating at the army medical board for a period of 20 years. The expediency of framing a digest of these documents, for the advancement of medical science, had frequently been suggested by the Director-general, though the reduced establishment of his department did not admit of its being carried into effect. Independent of the materials which have been made available in this report, these documents contain a vast mass of information relative to the treatment and medical history of the diseases incident to the colonies, which must prove of great utility to the medical profession in all questions connected with that interesting topic. It became necessary that the investigation should be committed to persons who were conversant with statistical details, and had been in the habit of condensing the results derivable from masses of figures into a succinct and comprehensive form. For this duty Mr. Henry Marshall, Deputy Inspector-General of hospitals, and myself, were nominated by the Secretary-at-war, on the recommendation of the Director-general. For the honour of this selection we were, I believe, principally indebted to the circumstance of our having been previously engaged in publications showing the extent of mortality among the troops in the colonies, collected from such limited sources of information as were within our reach. The documents submitted for our investigation, and which we were desired to take as the basis of our report, consisted principally of a series of returns furnished annually by every medical officer in charge of troops on foreign stations to the

principal medical officer of the colony in which he serves, detailing the number of troops under his charge, with the admissions into hospitals and deaths among them, in the course of the year, and a specification of the diseases by which they were occasioned. The contents of these are then condensed by the principal officer into one general return, embracing the sanitary details of the whole troops in the colony, which is transmitted to the medical department, where it forms a record of the state of their health for that year. These annual returns have generally been accompanied by a report on the causes by which it was supposed the health of the troops had been affected, their diet, duty, and employment, the state of the barrack and hospital accommodation, the topography of the station, the nature of the soil, the climate, the production of the colony, &c. From these sources of information, a report was prepared by Mr. Marshall and myself, showing the sickness, mortality, and prevailing diseases among the troops in the West Indies, from 1817 to 1834. On this report being submitted to the secretary-at-war in May 1836, he directed the investigation to be extended to the returns from each foreign station, forwarded monthly to the War Office, by which the details omitted in the medical returns might be supplied, and the average number constantly sick ascertained. He also directed an inquiry to be made into the influence of age and length of residence on mortality in tropical climates, by means of the returns of age and service which had been established in 1830 for this purpose, and that similar investigations should be carried on with regard to the troops in all the colonies. When an opportunity was thus afforded of rendering the report so complete, the marked difference which had been observed in the course of the investigation, between the salubrity of different stations, though in the immediate vicinity of each other, also suggested the necessity for a more minute inquiry into the nature of the localities where the troops were posted, with the view of ascertaining to what agency that difference might be attributable. This ultimately led to the preparation of the topographical descriptions now prefixed to the details of each station, which were carefully compiled from the medical records, and such other sources of information as were attainable. In the meantime, the returns for 1835 and 1836 were received, which enabled me to complete the results, for a period of twenty years. In carrying on this extended investigation, however, I was deprived of the personal superintendence of Mr. Marshall, who left London in June 1836: but, though the task of extracting and reducing into shape the mass of materials necessary for the completion of these labours has thus devolved upon me, I have constantly had the advantage of his revision, and, on all medical points involved in these details, of his assistance and advice. On the departure of Mr. Marshall, the Director-general kindly permitted me to avail myself of the services of assistant-surgeon Balfour, of the medical staff at Chatham, whose assiduity and intelligence in the collection and arrangement of the materials, has tended much to facilitate the progress of this investigation." I beg to add, that Dr. Balfour was associated with me in the preparation of all the subsequent reports.

6331. Then the great mortality shown on those stations was one of the prime causes of the efforts that were made to improve the state of the troops in the West Indies?—Yes, and it was an argument for all the changes that were subsequently carried out.

6332. Is there any annual return showing the mortality from each individual disease in the army?—Yes; both here and in the medical department. In the return now submitted, every individual disease is entered.

6333. Are there any means of distinguishing febrile affections proceeding from intoxication, sleeping out, and so on?—None; sleeping out and intoxication would both be crimes, and treated accordingly.

Colonel Sir
A. M. Tulloch,
K.C.B.

29 June 1857.

6334. Intoxication would go down in your return as fever?—Yes, but only if the effect of it was so great as to cause admission into hospital.

6335. You have not yet adopted that expression which has been imported from Germany, namely, "Alcoholismus"?—No; some medical officers class it under "Observatio."

6336. Do you distinguish between typhus and typhoid diseases?—Typhus, not typhoid.

6337. And continued fever?—Yes; continued fever.

6338. And periodical, remittent, and intermittent?—Yes; quotidian, tertian, and quartan, remittent, yellow fever, and typhus.

6339. Could you put in the forms that you use in making up the sanitary returns?—Yes, (*see App. No. LXXV.*) but the greater portion of the 20 years contained in the first series was made up from medical returns. At that time we had no sanitary returns, but as the former reports contained long discussions about diseases, it was deemed advisable to originate others more especially restricted to statistical facts.

6340. You say that the term used when the nature of a case is obscure and the diagnosis therefore imperfect, is "Observatio"?—Yes.

6341. Is it a general practice to make an immediate diagnosis in the hospital, when a case is brought in?—Yes; I presume so, from the circumstance that so few medical officers use the term "Observatio."

6342. If the diagnosis at first is wrong, one of two things would happen: either the man must be discharged and re-admitted with a view to a fresh nomination of his disease, or else you have got a man entered under one disease who turns out really to be affected by another?—Yes; there is a difficulty in either way; for instance, a certain number of men go into hospital with a slight catarrh, it next becomes chronic, and ultimately ends in consumption. Of course in comparing the admissions and deaths from chronic catarrh, every man discharged in order that he may be re-entered under the head of consumption, would by those who were unacquainted with the practice be reckoned as a recovery, thus giving rise to the conclusion that there were more recoveries from that disease than really took place.

6343. Would it not be an improvement if it were made a rule in hospital that the diagnosis should not be made until three or four days after the admission?—I think it would be an advantage if the word "Observatio" was kept up during the interval.

6344. What do you do in cases where it appears in the report as "Observatio"?—No results can be drawn from them except that a certain number had been in hospital without their diseases being ascertained.

6345. Would not the following return correct that?—There would be still an addition to be made under that head.

6346. In the next return the man's name would be opposite to catarrh instead of under "Observatio"?—We do not get nominal returns in the sanitary reports, we merely get a statement of the diseases. I do not think there would be the smallest objection to using the word "Observatio" to a greater extent than at present, in order to afford security against error; not that I think that any very important errors do arise. The only difficulty would be in the weekly returns; when these were once made up you could not alter them without the risk of error.

6347. Have you any comparison between the mortality among the officers or non-commissioned officers and the men?—Yes; so far as my publications have gone.

6348. Could you give the Commissioners a summary of your statistical inquiries, showing the mortality of the officers and privates at the several ages specified in your reports, distinguishing the cavalry and the infantry?—Yes, I could do so. (*See App. No. LXI.*)

6349. And distinguishing the results in England and Wales, Scotland, and Ireland?—No; but I could give all the foreign stations, and the officers and men respectively.

6350. Can you also give the very bad stations, the coast of Africa, and the West Indies?—Yes, I think I have got all those; I may say generally that the mortality among the officers is considerably less than among the men, and that this was held to be a measure of the extent to which it was possible to reduce the mortality.

6351. From the superior comforts enjoyed by the officers, and the better sanitary precautions which are taken?—Yes; and the diet; keeping always in view that an officer in bad health can sell his commission, which tends to make the rate of mortality among that class appear lower than it really is.

6352. (*Mr. J. R. Martin.*) The better habits of life, on the part of an officer, go far to give him comparative immunity?—Yes.

6353. Can you state the mortality in the army, on each of the stations?—Yes; for 40 years, on each station, and the principal diseases. (*See App. No. LXII.*)

6354. Can you show the mortality among the native troops at the same station?—Yes; the native troops, for example, in the West Indies. (*See App. No. LXII.*)

6355. Can you also give the mortality among the native population?—Yes; I have also got that; I had to investigate that matter very strictly, and it brought out some very curious details as to the negro population, particularly in the West Indies. (*See App. No. LXIII.*)

6356. That would show, whether the mortality among the soldiers exceeds that amongst the civil communities in those stations?—It appears to do so everywhere.

6357. In the same way, can you show the mortality as compared with the civil population at home?—Yes; and at the same ages, very nearly. (*See App. No. LX.*)

6358. The excess of the mortality among the troops, over the civil population, is considerable?—Yes, it is; I can also give the comparative mortality among British troops as compared with other armies. The mortality in the Prussian army, taking it upon an average of nine years, from 1829 to 1838, amounts to 13·1 per 1000.

6359. But they have a very short service?—Yes. In the United States army, in the northern division, from 1829 to 1838 also, the mortality was 18·8 per 1000.

6360. What sort of force is that?—The force is composed, principally, of deserters from our own army, and it is also composed of men rather more advanced in life.

6361. Do you apprehend that their service is confined to the northern states?—No; there are some in the southern states. I think Dr. Balfour published a statement, showing their distribution and mortality at each station, and that the great mass of them are in the northern states. In the French army, from 1842 to 1845, the loss was 19 per 1000.

6362. What was the length of service?—About seven years.

6363. The Prussians, I believe, serve only for three years?—Yes.

6364. Can you give the loss in the Indian army?—The loss in the Bengal native troops, taken for a very long period, from 1825 to 1844, was 17·9 per thousand annually.

6365. Were they sepoy regiments?—Yes, sepoys; the loss in the Madras native troops, was 20·9 per 1000; and in Bombay it was only 12·9 per 1000; but all those results show that the mortality is higher than the average among the population at the same periods of life.

6366. Have you a comparison of the mortality with that among the civil population?—No not in the East Indies, but I assume it is lower than among the military, because I do not think that any nation can

Colonel Sir
A. M. Tulloch,
K.C.B.

29 June 1857.

increase as the population does in the East Indies, which has a mortality as high as 20 per 1,000 among the very best class of the population.

6367. Will you turn to the table which shows a comparison of the mortality among the troops in England with that in the civil population?—Between 20 and 25 years of age the civil population loses 9·6 per 1,000; dragoon guards, and dragoons, 11·8 per 1,000; infantry of the line, 17·8 per 1,000.

6368. For a shorter service than that in the French army the mortality is greater?—No, it is 17·8 against 19 in the French army.

6369. Will you continue the comparison for more advanced ages?—Between 25 and 30 in the civil population, at the same period of life and in the same towns, the mortality is 10·4; while in dragoon guards and dragoons it is 14·3; infantry of the line, 19·8. From 30 to 35 the civil population mortality is 11·4 per 1,000; dragoon guards and dragoons, 14·6; infantry of the line, 19·8. From 35 to 40 the mortality in the civil population is 16·1; dragoon guards and dragoons, 15·3; infantry of the line, 21. Throughout the whole there is a very considerable preponderance of mortality amongst the military.

6370. You have not got the Foot Guards?—No; I have taken the Dragoon guards and dragoons, as it answers better to compare them, with the civil population of the towns in most of which they are quartered.

6371. Have you not a comparison of the mortality in the Foot Guards?—Yes; and it runs thus; from 20 to 25, 21·6 per 1,000; from 25 to 30, 21·1; from 30 to 35, 19·5; from 35 to 40, 22·4; but these troops are principally in and about London.

6372. Can you compare them with the London population?—No; the London population is a shifting population, and it is difficult to ascertain it.

6373. But the London population would afford you as good a test as to the Guards as the population of Manchester would afford you as to the dragoon guards?—As to the population of London, I apprehend there is a very great difference indeed according to the parts of London in which they live.

6374. But the Guards are quartered at the Tower, at Portman Barracks, and at Westminster, and those are three very different parts of London, representing very fairly the different degrees of health?—I suspect that the greater proportion of the lowest classes live in the very worst parts of the town.

6375. Can there be any place much worse than the Tower?—No, but it has not a very large population, and the Guards are only there for a time.

6376. That would be a comparison very unfavourable to the civil population, therefore it ought to tell in favour of the guards; still in point of fact, their mortality is very much excess?—I think so, particularly during the period to which I have referred, as there was a very heavy loss from typhus in the Tower.

6377. In the other calculations you have made, you have taken them against the whole population?—No, against the population of 24 large towns in most of which troops are generally quartered.

6378. Have you confined the comparison to males of the same age?—Yes.

6379. But even there the conditions are against the civil population, because it contains paupers, vagrants, and persons occupied in the most unhealthy trades?—That may be, as it extends over every class, but it comprises some of the very best towns. Those of which I have taken the population between 20 and 50 as the standard of comparison are, Maidstone, Northampton, Cambridge, Exeter, Bath, Bristol, Clifton, Dudley, Wolverhampton, Stoke-upon-Trent, Birmingham, Ashton, Leicester, Nottingham, Derby, Liverpool, West Derby, Manchester, Salford, Sheffield, Hunsfleet, Leeds, Sunderland, Newcastle-upon-Tyne, and Carlisle; in some of those there are only small detachments, but the great mass of the troops are scattered throughout them.

6380. If the unhealthy classes, such as paupers, and those exercising unhealthy trades, were cast out, then, of course, the difference would be still more unfavourable to the army?—Yes, but by that course you would only take the favourable classes, those who live in large houses having large incomes.

6381. Except that the people that live in large houses and have large incomes are not the longest lived people in the community?—They ought to be, having always good air to breathe and other advantages.

6382. But they are not so low as the rates of mortality among the agricultural labourers?—No; but if you took the country gentlemen alone, it would be so.

6383. On the other hand, there is a double process of expurgation of weak men going on in the army?—Yes.

6384. First of all there are certain removals of weak recruits, then there is the constant invaliding of the weakly and sickly men, so that the remainder are all picked lives?—Yes, they ought to be so considered, they are picked once in 21 years.

6385. (*Mr. J. R. Martin.*) How often has the standard of the British soldier been reduced since 1793?—It is impossible to say how often.

6386?—Has it actually been reduced three times?—I daresay 30 times; for the standard is reduced and raised again according as we want troops. I suspect that it will be found that the standard of 1793 was very low. I conceive to be a counterbalancing cause to the selection which takes place that you are always so anxious to get tall men, and do not attend enough to the capacity of the chest; thus slight young men are brought in who are the very class most subject to consumption.

6387. That is the case in the Guards; but with the exception of the grenadier companies, it is not the case in the line?—It is still more the case in the line.

6388. But the tall men are not very tall men in the line, they do not exceed 5 feet 10 inches?—Probably not, but they are always as tall as can be got; if there were two lads, one 5 feet 6, and the other 5 feet 9, the tallest would be taken.

6389. In those heights is there any difference in the healthiness of the two? they are both under a height which would produce weakness of body, are they not?—I suspect that where there is good capacity of chest the greatest strength of body will be found under 5 feet 6, rather than above it.

6390. (*President.*) Pugilists are generally about 5 feet 6?—Some men possess great capacity of chest, and the healthiest are rather under the medium size, they have greater width in proportion to their height.

6391. Have you any knowledge among your discharged pensioners of the rates of mortality for six months or a year after they have been invalided?—I know what is the mortality among temporary pensioners whose pensions seldom exceed two years and are rarely under six months; every one of that class may on the average be a year or a year and a half on the pension list. Out of a strength of 12,163, extending over a period of eight years, there died 1,446 or nearly 12 per cent. annually.

6392. At what average age?—It might be probably about 25, it is generally very low, but then it must be observed that these are almost all consumptive cases or men that had come home from the East Indies in a very bad state of health, suffering from dysentery or liver complaint; who seem almost always to die off speedily, or to recover.

6393. By the process of invaliding, the army rates of mortality have been improved by getting rid of those cases?—Yes.

6394. But those really belong to the mortality of the army?—Yes.

6395. What are the diseases which are so fatal to them?—Consumption, and pulmonary diseases, dysentery, and liver complaint.

6396. In the Guards the predominant diseases are pulmonary diseases?—Yes, almost everywhere,

6397. (*Mr. J. R. Martin.*) Within the United Kingdom?—Yes, this is the class of men who die chiefly.

6398. (*President.*) Seeing that you have picked lives at first, and therefore you ought to have the healthiest part of the population, the men being well clothed, and fairly fed, and housed, at any rate at a considerable expense, what should you say were the causes that have produced such great mortality among the soldiers?—It is a matter which I have very often considered without being able to arrive at any positive result, but I think one of the great evils is, their being massed together in large numbers.

6399. That is another name for want of ventilation?—Yes, of course.

6400. They do not suffer much from contagious diseases?—They suffer considerably from fever, but it is difficult to lay down a rule as to what is contagious and what is not; living together, however, in large barracks, if there be any contagious or epidemic disease, it is likely to spread among them.

6401. Does the army practically suffer much from epidemic diseases?—Comparatively little.

6402. (*President.*) You do not attribute much of the disease to intemperance?—I do not think that exists more among them than among the class of the population to which they belong. It has been said that the pensioners are more intemperate; but if they were so as soldiers, they would be more so as pensioners. Yet, when I go round to inspect them I have always the number present, the number absent, and the causes of their absence; and I have not found above 3 per cent. absent altogether, 2 per cent. of these are from certified sickness, and very rarely has there been 1 per cent. from drunkenness, which shows, I think, that drunkenness among them cannot be very common; and I think in the army if you examined into the number of men who come under the notice of the commanding officer for drunkenness, you would not find much more than the average in the population from which they came.

6403. There is a good deal of disease resulting from debauchery?—Yes, a great deal of venereal disease, which is much more common among troops than civilians, because there are comparatively few married men among them. Unless it be from the troops living altogether in a large building, and that tending to increase the mortality, I really cannot say what is the reason of their losing more than civilians; perhaps the sameness of diet may be another cause.

6404. There is a great deal of difference in the rate of mortality between the cavalry and infantry?—Yes.

6405. A cavalry man has a great deal more exercise and more work?—Yes.

6406. May not that have an effect?—Perhaps it may, and I have on that account always been anxious to see the soldier do more for himself; in fact, to labour at fortifications or anything that is wanted, as I think that might tend to improve his health.

6407. (*Dr. Andrew Smith.*) Do you not think that men who have been 3 or 4 years in the service have worse constitutions than people in civil life of the same age, and are more liable to be affected by the causes of disease from the various climates in which they have served?—If you mean those who have been a very long time in foreign climates, the mortality of that class is shown among the permanent pensioners.

6408. (*President.*) That would not apply to the Guards nor the cavalry, for the most part?—No, I may mention, however, one peculiar circumstance as to the Guards. In Canada, though the mortality among the troops of the line was 16·5 per 1,000 annually, during the same period the Foot Guards lost only 14·5 per 1,000; and instead of any great predominance of diseases of the lungs, the proportion who came under treatment on that account was lower by nearly one half than that among regiments of the line at the same stations, while the proportion of deaths was to within a fraction the same.

6409. (*Mr. J. R. Martin.*) Among the several causes which you have mentioned as tending to produce in-

creased mortality among the troops in the United Kingdom, should you say that defective ventilation was the most influential?—Certainly, I should say that the circumstance of so many living in one house must tend to produce disease; it is not merely defective ventilation, but there is probably the spread of disease. I do not mean to say how many diseases are contagious, and how many are not. It is said that in large factories the workpeople are far from being healthy.

6410. (*President.*) But the rates of mortality among the men employed in factories are better than the rates in the army, as shown in your book, of the same ages, but they do not sleep in the same rooms?—No, they do not, which may account for it.

6411. (*Dr. J. Sutherland.*) Are you aware that there is a house in London containing 600 inmates, including all ages, in which the mortality is about 13 per 1,000 per annum?—I have heard so; but doubt the accuracy of the calculation, unless extended over a long period.

6412. (*Mr. J. R. Martin.*) Have you any evidence of the comparative influence of the climate of Canada upon European troops recently from the tropics, as compared with the climate of the United Kingdom?—The only information I have upon that point is the fact that, within seven years referred to in the last report of Dr. Balfour and myself, the troops had all been sent from the West Indies to North America; and instead of the mortality having increased, as compared with the previous period, I think it rather decreased. At page 195 we stated, “notwithstanding this deteriorating cause,” that is, the arrival of several regiments from the West Indies, “as well as the exposure consequent on the insurrection, the mortality has been lower than in the preceding 20 years, in the proportion of 13 to 16·1 per thousand of the strength. This is partly, no doubt, attributable to the absence of epidemic cholera during the latter period, by which a loss averaging 2·1 per 1,000 of the strength was sustained in the former; but, after making the requisite deduction on this account, the decrease has been nearly one per 1,000 of the strength annually, and this although, by the rotation system of reliefs, the troops in Canada have been considerably older since 1838, than during the previous period.” By the rotation system, the men who went to Canada had previously served for three years in the Mediterranean, and three years in the West Indies, and probably three years at home, or nine years altogether, so that it was one advantage of that system of relief that if they deserted after such service when they went to America, there was no great loss to the public, as their prospective claim to pension was saved.

6413. (*President.*) To go back to the causes of mortality, you say that you do not believe that there is much intemperance in the army?—Not more than in civil life.

6414. Do not a great many of the cases of absence from barracks include men who have been drunk, and remained out rather than come in drunk?—That is true, I have no doubt, in some instances, but more generally the absence arises from being with women all night. I think that a regulation has been made recently, to prevent men staying out all night in order to avoid being noted for drunkenness.
